At a subsequent meeting of the Directors, Col. H. Montgomery-Campbell and F. L. Fuller were respectively reappointed president and secretary-treasurer of the Association.

It was decided to hold the 1914 Maritime Horse Show on April 1st, 2nd and 3rd.

The evening session of the Stock Breeders' meeting was held in the Assembly Hall of the N. S. A. C. when Dr. Torrens more fully discussed the Bovine Tuberculosis question before a large audience of stock breeders and the college students until nine o'clock when the citizens of the town of Truro showed their usual interest in their college by taking charge of the meeting. Refreshments were served and a social hour was enjoyed.

A Sliding Scale of Milk Prices.

Nature has decreed that cows shall put varying percentages of fat and non-fat solids into their milk, according to their breeds, their feeds, their ages, their lactation dates, their moods, their conditions and their environments. The natural range of butter fat is from 1.5 per cent. up to 10 per cent. The law makers of New York, through some unexplained and inexplicable becloudment of their intellectuals, have decreed that the cows when they put less than 3 per cent. of butter fat into their milk are law,breakers and "adulterate" their product. The same law makes the owner of the cow the adulterator if he offers their milk for sale just as they give it. To adulterate means to put in foreign substances. Nothing in that way is done by either the cow or her owner. Of course, if milk as the cows give it, with les than 3 per cent. of butter fat is adulterated by analogy, all milk with more than 3 per cent. of butter fat is adulterated. The "state standard" should work both ways, but in this case it does not. The standard has only forbearance, comfort, profit and legal safeguarding for middlemen, who, because of the standard, are at perfect liberty to insist that the milk producers shall hand over to them at 2 or 3 cents a quart, milk that contains from 4 to 6 per cent. of butter fat, which they, the middlemen, are permitted to standardize, that is to skim down to the standard of 3 per cent., and then sell it at 8to 12 cents a quart, while the removed butterfat is sold at cream prices. No "adulteration"- there of course. It is "adulteration" when the producer's cows give milk below the standard. It is not "adulteration" when the middleman skims out one to three per cent. of butterfat and sells the skim milk at full-milk prices. Was there ever a more monstrous absurdity than the "standard for milk?'j It robs the producer. It ignores nature. It outrages common sense. It protects the middleman in his exactions from the producer and his exortions from the consumer. The middleman can test a producer's milk, find it below the standard, accuse him of a crime and have him punished. The middleman can take milk above the standard and rob it down to the standard, and sell it as whole milk to the consumer, and neither the producer nor the consumer can have the middleman punished, because he keeps in line with the unjust and absurd standard which simply sets the limit of the middleman's wrongdoing and protects him in the injustice he practices daily. It would be interesting to see some expert attempt to justify the milk standard. The state can regulate the sale of milk on its percentage of fat and other solid contents. This method would mean a sliding scale of prices, such as a price for skim milk, other prices for 1 per cent. up to 6 per cent. fat., contents, of from 10 per cent. to 15 per cent. total solids in the milk. Then the consumer would get exactly what he wishes and would pay for what he gets. Then the producer would get the real market value of their milk. Then the middleman would have to deal honestly.—New York Farmer.

WOMEN CURED AT HOME

Women's disorders always yield from the very beginning of the treatment to the mild, but effective, action of Orange Lily. Within two or three days after commencing its use the improvement becomes noticeable, and this improvement continues until the patient is completely cured. Orange Lily is an applied or local treatment, and acts directly on the womanly organs, removing the congestion, toning and strengthening the nerves, and restoring perfect circulation in the diseased parts. In order to convince all suffering women of the value of this remedy, I will send a 35-cent box, enough for ten days' treatment, absolutely FREE to each lady sending me her address. MRS. FRANCES E. CURRAH, Windsor, Ont.

For Sale by Leading Druggists Everywhere.

"Body patented July 1912." No joints to open—made in two pieces double thickness in centre, neat, strong, durable—fully guaranteed. Send for descriptive folder.

Dominion Carriage Company, Limited, Toronto

Nova Scotia Fruit Growers in Annual Session.

(Continued from page 264)

partial adminstration, sincere friend and earnest advocate of all that meant the best and truest progress in the fruit interests of the Dominion of Canada, his loss is nation wide.

We the members of the N. S. F. G. A. desire to place on record our deep sense of this loss and take this opportunity of expressing our sympathy with his bereaved family.

* * *

Whereas our three Counties' Exhibitions has been held at a date which prevents many of our growers exhibiting on account of the press of work at that time.

And, whereas, the Ontario Fruit, Flower and Honey Show is held at a much later date after the rush of fall work has been ober, thus enabling the grower to exhibit. Therefore resolved that our said three counties' exhibition) be not held until a later date in the season.

* * *

Resolved that a committee be appointed to inquire into the reason why Nova Scotia apples sell, variety for variety and grade for grade, at an average price of nearly $1.00 per barrel lower than Ontario apples.

Committee.—Capt. C. O. Allen, F. Chute, Lester Wiltshire.

* * *

We the members of the N. S. F. G. A. to place on record our congratulations to our venerable member, Mr. R. W. Starr, on the fact that he has with this year made a record of fifty years continued attendance at our meetings and has been during that time of unestimable value to the wark and progress of the Association.

* * *

The foregoing resolution was spoken to by several fruit growers who expressed their appreciation of Mr. Starr's life long career in fruit growing.

Mr. Starr who was almost completely overcome with emotion, replied thanking the fruit growers for their thoughtful remembrance.

* * *

Resolved that Prof. L. Caesar, Prof. W. H. Britain, Prof. W. S. Blair and Mr. Geo. Saunders be made honorary members of the N. S. F. G. A.

* * *

Resalved that the Minister of Agriculture, the Hon. Martin Burrell, be asked by this Association to raise the Fruit Division, at Ottawa, to the rank of a Commission with a suitable head.

* * *

Resolved that the N. S. F. G. A. indorse the request of the National Fruit Growers' Executive to the Federal Government for an annual grant of $2,500.00 for the purposes of the National Fruit Growers' Association.

* * *

Whereas, the Department of Agriculture of the Government of Nova Scotia has taken a progressive step in the appointment of an Entomologist to carry on investigations upon and wage war against insects and already good results have been accomplished. And whereas, it is at least equally important that a similiar expert be appointed to investigate and give advice in regard to plant diseases.

Therefore resolved that we recommend the appointment of a Plant Pathologist for the Province of Nova Scotia.

* * *

Resolved that the Government be asked to define a No. 3 apple with the view of raising the present standard.

* * *

Whereas, the potato trade in Nova Scotia has suffered in the past on account of many shipments going abroad containing small and unmerchantable size potatoes unfit for table use.

Therefore resolved, that the N. S. F. G. A. request the Department at Ottawa to define a legal minimum size of potatoes for export and appoint an inspector to perform similiar duties to the inspection at present carried on under the Fruit Marks Act.

Can you arrange the above sets of jumbled letters into the names of eight well known fruits. If so, YOU CAN SHARE IN THE DISTRIBUTION OF THE ABOVE PRIZE. It is no easy task. But by patience and perseverence you can probably make out 5 or 6 of them. To the person who can make out the largest number we will give the sum of One Hundred Dollars. To the person making out the second largest number the sum of Fifty Dollars. To the person making the third largest number the sum of Thirty Dollars. To the person making the fourth largest number the sum of Twenty Dollars. Should two persons send answers equally correct, the first two prizes will be divided between them, (each receiving $75.00) Should three send in equally correct answers, the first three prizes will have to be divided, (each receiving $60.00). Should four persons send equally correct answers, the whole sum of $200.00 will be equally divided (each receiving $50.00), and so on in like proportions, provided they comply with a simple condition about which we will write as soon as answers are received. WE DO NOT WANT A CENT OF YOUR MONEY WHEN YOU ANSWER THIS ADVERTISEMENT. If you can make out anything like a complete list, write us at once enclosing 2-cent stamp for our reply. DO NOT DELAY, WRITE AT ONCE. Address, CANADIAN MEDECINE CO., Dept. 81 MONTREAL, QUE.

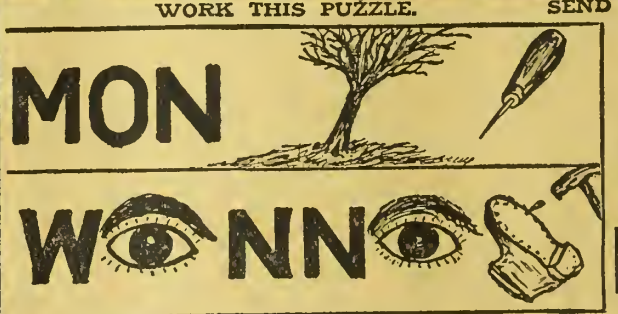
WORK THIS PUZZLE. SEND NO MONEY.



$50 GOLD PRIZE

ALSO MANY OTHER PRIZES as PREMIUMS. Somebody who sends the Correct solution in this Puzzle Contest telling us what TWO CITIES are represented by the above two sketches will receive a $50 GOLD WATCH or $50 IN GOLD MONEY! as stated in the certificate of entry. In the event of a tie between two or more persons for the PRIZE, a Prize identical in character and value will be given each person so tied. Everybody who answers this Puzzle correctly will receive a beautiful Post Card FREE. Contest closes Dec. 31st, 1914. Try at once. It may be you. Use your Brains. Write your answer on a Post Card or letter, giving name and address plainly.

DOMINION WATCH COMPANY, Dept. 86 MONTREAL, CANADA

It Pays to Advertise in the Maritime Farmer.

Think of Spraying, Think of Spraymotor--- Think of Spraymotor, Think of Spraying!

WHAT is going to increase the yield from non-sprayed trees, row crops and vineyards? Spraying!

Is it ever too late for spraying? Not while trees, row crops or vineyards still bear. While there's life there's hope—of better crops.

What proofs exist of the benefits of spraying? There are actual proofs at almost every agricultural exhibition and country fair. See exhibits of sprayed and unsprayed fruits side by side. Notice the stunted, retarded development of fruit and vegetables which have not been sprayed. See the blight, canker, worm-eaten appearance and meagreness of grown things that have been left to the mercy of pests and parasites.

Then contrast them with the **protected, sprayed** product of field and orchard. Here you see plump, fully developed specimens brought to perfection unhampered in their growth by gnawing insects, rotting fungoids and withering disease.

There are proofs for you even if you never attended a Fall Fair in your life. The farm papers in every part of the country are full of photographs showing sprayed and unsprayed crops side by side. There are articles by the score published every year, urging spraying for better results, and giving the actual experiences of men who have tried both ways, offering freely of the advice of the foremost authorities in the land.

When You Are Ready to Spray Get A Spramotor!

Realize what the following means :—**We make Spraying Machines, and nothing else!** Perfecting the SPRAMOTOR has been our whole concern since we started in business years ago. There has been no side issue to distract, no other line of business to claim part of our attention and engage part of our thought.

We have labored to some purpose, because today we present in the SPRAMOTOR, the highest type of efficient spraying outfit on the market

Do not think we make this statement without the best of reasons. The SPRAMOTOR has been awarded over one hundred Gold Medals and First Awards at the hands of competent, critical judges. For instance :—

First Award at Canadian Government Spraying Contest, Grimsby, Ont. (11 entries.)

First Award at International Exhibition, Glasgow, Scotland.

Gold Medal at Pan-American Exposition, Buffalo, N. Y.

Gold Medal at Canadian Industrial Exhibition, Toronto, Ont.

Gold Medal at Halifax Exhibition.

Gold Medal at St. John, N. B. Exhibition.

Gold Medal at Western Fair, London, Ont.

Gold Medal at Central Exhibition, Ottawa.

2 Gold Medals at Council Bluffs National Horticultural Congress.

The above results come from being **specialists** in spraying machine construction and manufacture. We do not make a line of pumps or gasoline engines or windmills in addition to our spraying outfits. No! SPRAMOTOR gets all our attention and all the time we have for experimentation in the endeavor to still further perfect our output.

The judges at all the above exhibitions and at many others where SPRAMOTORS carried off first honors, were able, impartial men who gave credit where credit was due. Yet it is not from these men that the highest praise of SPRAMOTORS comes. It is from men out in the field and the orchard, men who actually use our machines year by year in betterment of their crops, men who have **seen** the improvement of the trees and plants upon which they depend for their livelihood.

It is a wise man who buys a SPRAMOTOR. It is a wiser man who gets all from a SPRAMOTOR that it will perform. This is the man who paints and whitewashes with his SPRAMOTOR during the idle season, disinfecting, fireproofing and brightening up his barns, hen houses, stables and outbuildings generally. You can apply lime, whitewash and paint, better, quicker and far more economically with a SPRAMOTOR than in any other way.

We Give a Written Guarantee With Every Spramotor Sold

For your protection and to ensure that every purchaser of a SPRAMOTOR will be a SPRAMOTOR booster, we bind ourselves to this condition :—**Every machine we ship is to be exactly as represented or money refunded.**

Furthermore, we undertake this :—

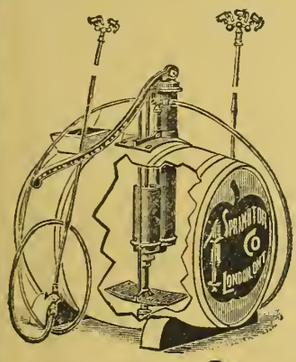
All Spramotors are guaranteed for life.

Any part proving to be defective in either material or workmanship will be replaced free of charge.

Now, since we do not wish to be troubled with constant repairs and changing of parts, you can see how it pays us to test every machine carefully before it goes out.

There is a Spramotor for every need--for the small farm as well as the largest Prices from $6 to $350.

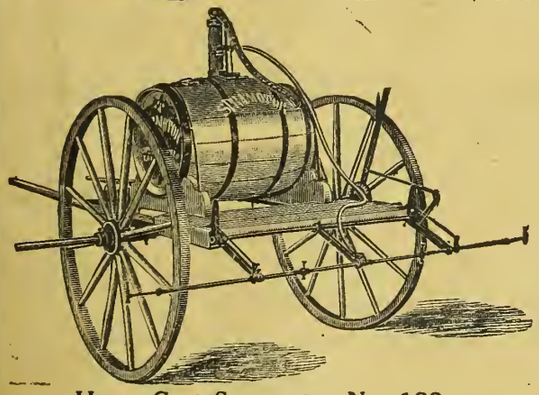
We make outfits in all sizes and capacities, from a Hand SPRAMOTOR costing only $6 to $360 gasoline machine. No matter which SPRAMOTOR you buy, be assured that you are getting **the best spraying outfit on the market** at the price.



Hand Spramotor Outfit No. 117

For high Spraying, 1,000 Trees or less.

This machine comes to you with two hose lines, each 10 feet long with couplings attached, patent hand valves, 2 bamboo extension rods with inside brass tube, brass cupped ends and patent drip guard, two double nozzle clusters, everything complete and ready to work.....**$26.00**



Horse-Cart Spramotor No. 123.

Can be arranged for all kinds of Spraying.

We built this machine to supply the demand for a good, moderate-price rig that could be used by hand, as many growers need a spraying outfit suitable for all kinds of work—row crops, orchards, vineyards, potatoes, etc., also painting and whitewashing. Outfit consists of 50 gal. cask on substantial hardwood frame, with 52 inch wheels. Equipment varies according to needs specified (see catalogue, page 57.)

Prices from $50.50 to $82.45.

Horse Power Spramotor

For all forms of Spraying on a Large Scale

With this outfit, the grower can meet every spraying need, whether row crops, vineyards or orchards. The horse does all the work—operator merely has to direct the spray. Twelve nozzles may be operated at once, spraying with a searchng pressure of 150 lbs. Extra nozzles may be added for weed destruction and operated at 100 lbs. pressure. For full description of this splendid outfit see page 69 of our catalog. Price complete as shown.....**$140.00 to 170.00**

Gasoline Spramotor Model C.

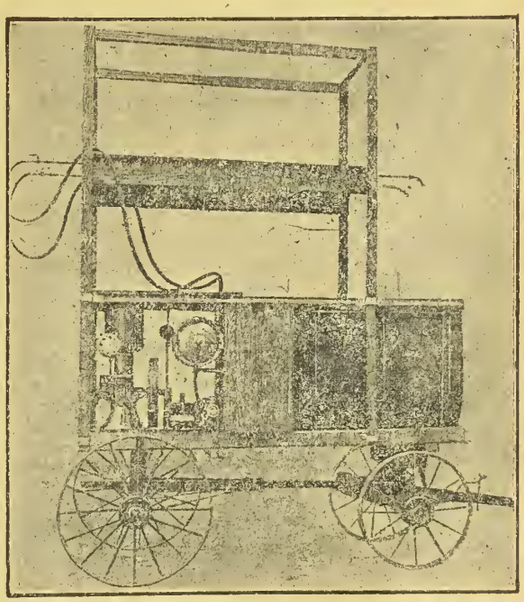
The Highest Type Spraying Outfit Made To-day.

Driven by double-acting, single piston motor of original design, (all parts standardized and renewable). 12 gallon Air Chamber relieves working parts of motor and pump of all shock and jar. Automatic Regulator placed on pump and gear frame, provided with emergency valve set at 250 lbs. pressure. Spraying Deck is three feet wide by six feet long, enclosed by rail 34 inches high,

Everything about this outfit is the result of years of practical experience and efficient work in the field,

Complete outfit consists of the following —

4 inch platform, 200 gallon tank, caboose with SPRAMOTOR, geared jack, automatic regulator, 12 gallon air chamber, strainer, agitator, emergency valve, two lines best 300 lb. hose and couplings, 12 feet each, two leakless stopcocks, two 10 ft. bamboo rods with drip guards, two 4-nozzle clusters, derrick 2½ h. p. hopper-cooled engine (attached) and low down wagon with heavy iron 4-inch wheels. **The whole guaranteed for the life** of the outfit against defects in materials and workmanship. Price complete and ready to run.....**$340,00**



These four models are simply representative outfits chosen out of our entire range. There are dozens of others. There is a spraylng outfit in the SPRAMOTOR line that will exactly fit your requirements, and we'll sell it to you at the same price as you would have to pay for an inferior machine.

Free While you are thinking about it. today, write us stating your exact needs in the way of a spraying outfit. This will not obligate you in any way. By return mail we will send you a copy of our valuable, illustrated treatise on "Crop Disease" without charge.

SPRAMOTOR CO., 1720 King Street, LONDON, CAN.

The Prince Edward Island Poultry Show.

The Sixth Annual Show held under the auspices of the P. E. I. at Charlottetown, P. A., 16th to 19th December was by far the best poultry show ever held in Prince Edward Island. The quality in all departments was excellent, the winning birds all scoring high.

A new feature this season was the introduction of a large utility class in which farmers only were allowed to compete and the birds entered in this class were strong evidence of the rapid strides being made by Prince Edward Island farmers in poultry culture.

It was noticeable that members of the Prince Edward Island egg circles carried off a large proportion of the prizes.

It should be mentioned in fairness that some who are scientific breeders and who could have claimed to compete in this utility class, refrained from so doing to give the farmers generally a fair chance. Among these may be mentioned, Mr. L. H. D. Foster, of Charlottetown. Mr. L. H. D. Foster's Barred Plymouth Rocks which were on exhibition are excellent birds, as also are Mr. George Lightizer's White Wyandottes, showing as they do perfect health and vigor.

The egg exhibit put up by the Poultry Division of the Live Stock Branch of the Department of Agriculture, was thought out in a masterly fashion and was really a wonderfully clear and graphic illustration of the old wrong way, and the new improved systems of marketing eggs. Every feature of the two systems was clearly compared by means of models set on landscape paintings, the great advantages of the egg circle system to both producer and consumer being made manifest. We understand that Mr. J. H. Hare of the Department at Ottawa is responsible for this exhibition as far as details are concerned and Mr. W. A. Brown who is in direct control of the poultry division is to be congratulated, as is the Department, upon the unqualified success of the exhibit both at Amherst and Charlottetown.

Editor's Note:—A full list of prize winners will be found in our next issue.

Heaves CURED

Preservation of Barnyard Manure.

Professor F. H. King, in his book "Farmers of Forty Centuries," describes the methods used by the Chinese, Koreans, and Japanese in collecting and preserving manure, both solid and liquid, also the systems of composting used. In China, the manure is placed in glazed terra-cotta urns, some having a capacity of 1,000 pounds. In Japan cement-lined pits are used, the liquid excrement as well as the solid being carefully preserved. In China the compost piles are carefully plastered with a layer of earth mortar.

The results of the latest scientific investigations do not give us any better method than that practiced by the Chinese for many centuries.

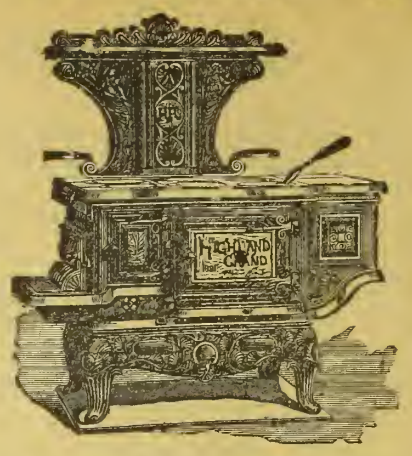
When fresh manure is taken directly to the field and distributed, the loss of plant food is reduced to the minimum. The practice of allowing manure to accumulate in piles or otherwise on the ground, exposed to the action of rain or snow, is exceedingly wasteful as the leaching removes a large part of the plant food. Fresh straw is much more valuable as a source of plant food than straw which has been exposed to the weather. A heavy rain washes out a considerable portion of the potash salts in the straw. Old straw is still of some value as a source of organic matter.

When manure is allowed to accumulate it should be kept under cover and if covered with a layer of earth the loss of plant food will be still further reduced.—G. W. Walker, Assistant Soils Chemist, University Farm, St. Paul.

Fitting the Punishment to the Crime.

The milkman who waters his milk and the grocer who adulterates his butter are not, after all, the products of our modern civilization and the culture of the Board school. These gentlemen, it appears, have an ancestry, if one may use the word, of a respectable antiquity. Witness an edict which an antiquary has discovered in the archives of Puy-de-Dome, in which the punishments assigned to the various forms of fraud fit the crime with a Gilbertian completeness. Thus, "whosoever shall have sold watered milk, in his mouth shall be set a tube, and into the said tube shall be poured the watered milk till the doctor or barber there present shall assert that the culprit cannot swallow more without being put in danger of his days. Whosoever shall have sold butter containing turnips, stones, or any other foreign substance shall be seized and attached in a very curios manner to our pillory of Pontet." One would like to know what the very curious manner was. "Then the said butter shall be placed on his head till the sun shall have melted it completely; and in the meantime the children and meaner folk of the village shall insult him with such outrageous epithets as shall please them—subject to the respect of God and his Majesty. Whosoever shall have sold evil or rotten eggs shall be seized by the body and exposed to our pillory of Pontet. The said eggs shall be given to the children of the villages, who shall, by way of joyful diversion, throw them in the face of the culprit, so that all may be full of merriment and laughter." What a red-letter day it must have been for the children when a large consignment was seized and there was enough ripe eggs to go round! Justice had a humorous way with it in those good old days.—Daily Telegraph.

A First Rate Baker



Easy to Work With, Light on Fuel, Strong and Durable

That these features form, together, the RANGE AS IT OUGHT TO BE, is known by all housewives. In the

HIGHLAND GRAND RANGE

these important points reach highest perfection. Its fine roomy oven is extra large, well ventilated, and the heat,—under ready control,—is exactly the same on the sides, top and bottom. The HIGHLAND GRAND

Burns Either Coal or Wood

equally well. Its structural features embrace all that is best in LATEST MODERN IMPROVEMENTS—large fire-box, patent sifting and dumping grate, large convenient ash pan. Made with high closet, upper or lower mantel shelves and reservoir.

Grease

I have two horses that have scratches. One of them has got a big leg, but not from scratches. It made its appearance in about one day. A doctor treated it and the leg is still large, but not quite so bad as the first. Scratches have appeared on that leg as well as on two others. What should be done in such a case? I bathed the leg with hot water and it took the swelling down somewhat. Concerning the scratches I used some medicine a doctor gave me. It healed them all, but some plaes left ridges and they will not heal. I have used lard without any effect and they got worse. Both horses have the same kind of scratches and at the same time. They have had them now for about two months and I have been doctoring them all the time.—A Subscriber.

Answer—Feed very lightly and make the horse live an outdoor life, as far as possible. Poultice the parts with hot flaxseed meal until discharge ceases and then wet two or three times a day with a weak solution of concentrated lye to be gradually made stronger, as found necessary.

Soft Crop.

Irregular feeding and watering cause a distension of the crop, in other words, the fowl overloads and distends the crop when fed frequently, causing it to become permanently enlarged and to hang down, rendering it impossible to perfectly press the food through the oesophagus into the stomach the food and water thus remaining in the crop becoming sour and producing inflammation and disease, better known as "soft crop" and inflammation of the crop.

A Dairy Farm On Top Of a Sky Scraper.—In New York City there is a dairy farm right in the heart of the busy city. If you can overcome your incredulity long enough to accept this statement you will probably think this farm is safely and sanely resting on old mother earth as dairy farms should do. Mistaken again! This dairy farm has contracted the habit, common in the city, on scorning the lowly earth and has become a "flat" dweller. In fact, it is found in the very top of a theatre building. There are three cows, a dairyman and a dairymaid in attendance. The latest down-to-date machinery including a milking machine, is used to convert the lacteal product into tempting dishes for the patrons of the summer theatre, which is also on the roof. Two thousand people visit this unique farm every day, so 'tis said. It is not to be presumed that these three cows furnish a glass of milk or a dainty for every visitor. They reserve these for the theatre visitors who are fortunate enough to be the recipients of these favors. For many of these visitors this little glimpse of cowdom is the only peep they ever get of the process by which a great city is furnished its milk. It is as novel to these city dwellers as would be a Broadway scene at midnight to the country crossroads dweller.—Herald's Dairyman.

Feed for Health.

The physical care a child receives during the early months determines largely whether it is to be a strong, healthy adult or sickly, unsuccessful one.

A well-known doctor recently stated publicly that nine-tenths of the deaths during the second summer are caused by the food given a baby during the first summer. We constantly see cross babies, and those who are really ill, partaking freely of the very foods which brought about that condition.

The baby should have no food but milk until it is one year old. Do not begin giving tastes of other food. The stomach will endure much, and it often happens that when the baby is given improper food and does not become immediately ill, we fail to see that it is that which makes him peevish and irritable. And when he does get sick the parents say it is his teeth. We are so accustomed to the old idea that a teething baby must suffer that we have been slow to see that we brought about the trouble by a heterogeneous diet.

The child who is to grow up strong and well must be allowed no starchy food before the age of two years. The reason for this rule is simple. The digestive juice that acts on starches is never present until a child has reached that age.

CAREFUL DIET.

Your child between one and two need not go hungry. Besides an abundance of milk it may have the juices of peaches, prunes and oranges, broths, long-cooked oatmeal, graham crackers, coddled eggs, nonstarchy breakfast foods with milk and sugar, crisp toast with butter, baked apples and scraped rare beef.

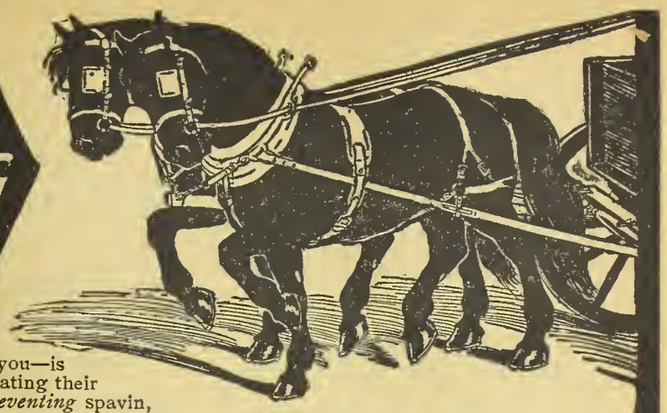
A pleasing variety may be had by a little study. Do not give potatoes or other vegetables to a child under three.

To thus carefully diet your child will be no small task. There will be plenty of older women to tell you it is "new-fangled" nonsense and that they fed their babies everything, from the time they were five to sixth months old. It is no doubt true. And those babies were always ill during teething, and it was very hard to get them through the "second summer," and one-sixth of them died during the first year.

Do not trust the advice of a woman just because she has had a large family, unless that family have strong constitutions and clear brains. The educated physician will give you sounder advice than the uneducated mother.—Pearl Chenowerth.

If your children are subject to attacks of croup, watch for the first symptom, hoarseness. Give Chamberlain's Cough Remedy as soon as the child becomes hoarse and the attack may be warded off. For sale by all dealers.

KEEP YOUR HORSES IN PRIME WORKING CONDITION



A HORSE in the field—working for you—is worth two in the barn—simply eating their heads off. There is no way of *preventing* spavin, ringbone, splint or curb from suddenly laming and laying up your horses—but there *is* a way of *safely* and *easily curing all these ailments* and preventing them from *keeping* your horses laid up. For over 35 years there has been a reliable remedy that horsemen everywhere have *depended* on to save them money, time and worry.

Kendall's Spavin Cure

has been the trusted remedy of horsemen everywhere. It has not only been saving untold time, work and worry but thousands of dollars' worth of valuable horseflesh and has many times saved horses from death.

Here's a man—Mr. David Waddell, Marney Man., who has used Kendall's Spavin Cure for a quarter of a century and is still using it to cure Lame Horses. He writes: "I have used Kendall's Spavin Cure for 25 years and always found it good."

Here's another man who uses it on himself as well as on his horses and cows. Mr. J. H. McCulloch, Cottonwood, Sask., writes: "We have been using Kendall's Spavin Cure on our horses and find it an excellent cure for cuts, bruises and lameness both on horses and human. It is also good for Caked Udders on cows."

Never be without a bottle of Kendall's Spavin Cure. You can never tell when accidents will happen—when this remedy may be worth the price of your best horse. It is better to be *prepared.*

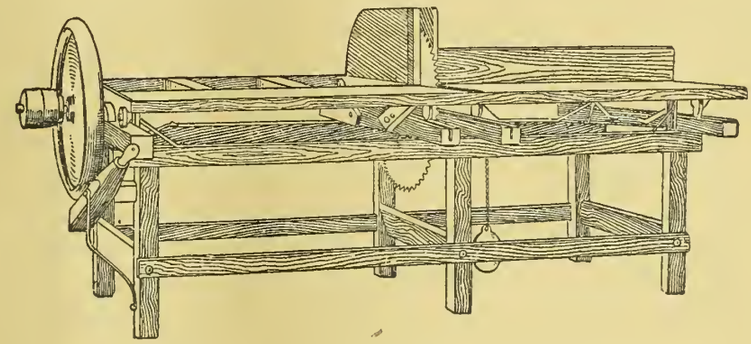
Don't call your case "hopeless" in the face of above testimony. 70

Next time you go to town get a couple bottles from your druggist. The price is uniform, only $1.00 per bottle, 6 bottles for $5.00. At the same time ask for our invaluable "Treatise on the Horse," or write to

Dr. B. J. Kendall Co., Enosburg Falls, Vt., U. S. A.

WOOD CUTTERS

Made in Four Different Sizes



We are offering these machines to the public with the belief that they are the best wood cutting machines on the market for the money. The Frame is made of the best seasoned hardwood, and well bolted and braced. The Arbor is of the best turned steel, and runs in bearings made of the finest quality babbit. The Balance Wheel is a solid web and weighs 180 lbs. The Table is of heavy Plates and indestructable. Wood Cutters are shipped with 28 in. saws unless otherwise ordered.

Remember we manufacture the celebrated Little Giant Thresher, The Sussex Root Pulper, Farmer's Feed Boilers, Grain Grinders, Hay Presses and Plow Castings.

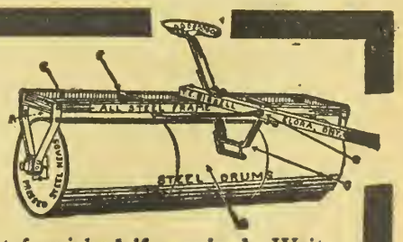
The SUSSEX MANUFACTURING Company Limited, SUSSEX, N. B.

The "Bissell" is a 3-drum roller

3 DRUMS make the best Land Roller. It is easy to understand how the "Bissell" Roller with 3 drums and supported by 6 heads is a STRONGER IMPLEMENT than any 2 drum Roller on the market. With 3 drums the centre bearing is not needed. When the "Bissell" Roller is at work, the axle turns with the drums.

It costs more to manufacture the 3 drum Roller than the 2 drum, but you pay no more for the "Bissell" 3 drum and get BETTER VALUE FOR YOUR MONEY. You get heavier weight in the "Bissell" drums too.

The good points cannot all be told here. Ask your dealer about the "Bissell" Roller and do not be put off with a Roller unless the name "Bissell" is plainly stencilled thereon.



Grass Seeder Attachment furnished if required. Write Dept. M for free catalogue. 63

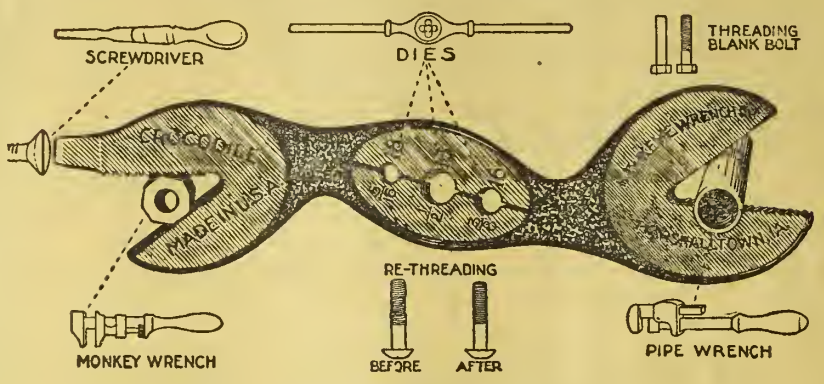
The Crocodile Wrench

An All Around Handy Tool for the Home, Farm and Shop



Six Handy Farm Tools in One

The Crocodile Wrench is drop forged from the finest tool steel and scientifically tempered. Every wrench guaranteed against breakage. It is 8 1-2 inches long and weighs ten ounces.

A pipe wreuch, a nut wrench, a screw driver and three dies 5-16, 3-8 and 1-2 inch for cleaning up and re-threading rusted and battered threads, also for cutting new threads on blank bolts. Dies will fit all bolts used on standard farm machinery.

Teeth and dies are case-hardened in bone-black, making them hard and keen.

The dies on this wrench alone would cost $1.50, and would be worth more than that to every farmer, as they would often save valuable time, besides an extra trip to town for repairs.

How to Procure a Crocodile Wrench

On receipt of $1.00 we will send you the Maritime Farmer for one year and also one of these Crocodile Wrenches. New subscriptions will date from time of recipt, renewals from date of expiration of present subscriptions.

The Maritime Farmer, Sussex, N. B.

Nova Scotia Farmers in Annual Session

Banner Meeting at Bridgewater

The eighteenth annual session of the Nova Scotia Farmers' Association was held in the comfortable court house of the pretty town of Bridgewater, on the banks of the famous La Have, the Rhine of Nova Scotia, that with its tributaries drain the rich agricultural areas of Lunenburg County.

THE OPENING SESSION

was held on the evening of Tuesday, January 27th, when, after several numbers had been rendered by Webb's noted family orchestra, H. W. Corning, M. L. A., President of the Association, read his address.

The spacious hall was filled to overflowing at every session. A large number of delegates representing all parts of the province were present and Lunenburg County farmers, their wives and daughters and sons very creditably patronized the meetings.

PRESIDENT'S ADDRESS.

To the Officers and Members of the Nova Scotia Farmers' Association:

Gentlemen:—It is with pleasure that I extend to you a most hearty welcome to this the eighteenth annual convention of the Nova Scotia Farmers' Association, meeting as it does for the first time in its history in the busy town of Bridgewater.

As we come together again after another year of labor, let us first give thanks to Our Gracious God for the countless blessings that we have enjoyed during the past year, for the privileges of meeting again under such favorable circumstances and for the bright and hopeful outlook for the future.

Owing to the partial failure of the apple crop the total net cash returns from the land of our province will not be quite as much during last year as in 1912. Yet we can record a marked increase in dairy products and a good yield of hay, potatoes and root crops.

LIVE STOCK.

The encouragement to live stock development during the year has been gratifying indeed. The grants to agricultural societies were increased by the Nova Scotia government which should allow the societies to do more efficient work. The Dominion Government has undertaken, through the Live Stock Branch a widespread distribution of pure bred male animals, in districts that were not already organized, and during the fall a large number of pure bred rams and boars were supplied associations in different parts of Nova Scotia.

EXHIBITIONS.

The County Exhibitions all report successful years and there is no doubt but that these shows are beneficial to agriculture. The Provincial Exhibition held at Halifax was well up to the average both in quality of exhibits and attendance.

The Maritime Horse Show held at Amherst in April was great success and a credit to Eastern Canada.

The Winter Fair held at Amherst in December was the best yet and compared favorably with any of its kind held in Canada.

A number of successful Poultry shows were held in different parts of the Province during the early winter which also marked progress made in improved poultry raising.

AGRICULTURAL EDUCATION.

The Dominion Agricultural Bill of last year which provides for ten millions in ten years brings to those interested in agriculture in this province great encouragement. Last year this province received $54,282.45, which amount will be increased by $6,858.00 each year until 1917—when the annual grant will be $81,719.21 which this province will receive each year until 1923 from the Federal Government for Agricuftural education.

This has enabled the Government of Nova Scotia to favorably consider the resolution that was passed, at our annual session last year at Sydney in reference to a short course be-

Nova Scotia Farmers in Ann ual Session at Bridgewater, N. S.

ing held in different districts of the Province.

In the near future at least five of these short courses will be held in as many districts. These should add very materially to the interest already being taken in Agricultural education and should encourage a larger number of our young men to take advantage of the two years' course at our Agricultural College, Truro.

A goodly amount of institute work has been done during the year and I believe that the County Associations should take this work up with increased interest and put on meetings in every district of the province during the coming year. We can hardly estimate the value of these meetings.

In conclusion let me express my extreme satisfaction at finding this session of our Association convened in this beautiful town of Bridgewater, in the great County of Lunenburg, on the southern coast of our Province. My sincere wish is that this will be one of the most profitable sessions in our history. To this end I would solicit the co-operation of each one of you.

ADDRESS OF WELCOME.

Following the president's address, Mr. H. A. Hebb rendered a comic vocal selection after which His Worship Mayor Dawson, Arthur Raberts, Town Solicitor and Secretary of the Maritime Union of Municipalities extended greetings from the town and union. Mr. Dawson referred to the incentive to better fruit growing that had followed the meeting of the Nova Scotia Fruit Growers' Association held in Bridgewater several years ago and expressed the hope that a still greater impetus would be given the course of better farming through the seed sown by the 1914 annual gathering of the farmers in his town.

LUNENBURG COUNTY GREETING.

Wallace Rhodenizer, President of the Lunenburg County Farmers' Association read the following address:—

"I beg on behalf of the Lunenburg County Farmers Association to extend to you a cordial welcome to our fair County of Lunenburg. It was with great pleasure that the Lunenburg County Farmers heard that the Provincial Farmers' Association would be held in Bridgewater, which on account of its central situation affords a grand opportunity for the farmers of Lunenburg County to attend your meetings and thus get in touch with the best agriculturists of the Province. The County Association is in a healthy condition gaining nearly three hundred members the past year. A number of meetings were held which were largely attended.

"A striking evidence of how farmers are progressing in this County is found in the greater interest taken year by year in our Annual Fall Fair. The Fall Fair of 1913 was more largely attended than ever before and although some classes of exhibits were not as large as in previous years. In the standing field crop competition open in the various counties of the province, Lunenburg was able to show 8 entries on oats and 5 on potatoes. Farmers are beginning to realize that it pays to hand select your seed and to cultivate that soil more than we have in the past.

"It is worthy of special note that during the past year there were two co-operative fruit companies found, one at New Germany and one at Hebbville. The apple crop was light but the farmers are getting more for a light crop than they did for the larger crop in 1912.

"There seems to be a new era dawning along dairy lines. An Act of Incorporation has been passed recently with the result that the La Have Creamery has become a reality.

"In viewing the agricultural situation for 1913, we feel that we have great reason for encouragement, although somewhat disappointing in some lines. Yet after all conditions are not so bad as they might be.

"In conclusion I feel very much pleased that the Nova Scotia Farmers' Association decided to meet this year in the fair Town of Bridgewater.

"Again gentlemen I extend to you a most hearty welcome to our County and hope that you may meet with us again at some future date."

Wm. O'Brien, vice-president of the association fittingly replied to the cordial welcomes. He had been much impressed with what he had seen of Lunenburg county. The farms along the line were snug and home-like, and showed that the farmers were thrifty and prosperous. The value of an agricultural education and the necessity of making the home life happy for our young people on the farm were also emphasized by Wm. O'Brien.

The Farmers' Association was educational in character and from that source as well as from the social aspects of east meeting with west he trusted much benefit would be derived by all who would attend the meetings.

Following a musical number by Hebb orchestra and a vocal selection by a Bridgewater male quartet, Hon. W. H. Owen, Member of the Nova Scotia Legislative Council, A. C. Zwicker, M. L. A., and J. W. Margeson, M. L. A. for Lunenburg County had words of cheer to offer. Mr. Zwicker said the apples exported from Lunenburg County were the best received on the English market in 1913. Lunenburg County was noted for its mixed farming. Dairying was in its ascendency in the county and the energy that had been put into the organization of the La Have Creamery, now nearing completion, was a good omen for the future of the industry in his country.

Some of the points touched upon by Mr. Margeson were;—

How to keep our young men on the farms; agriculture in the common schools; making home life attractive; parcel post; rural telephones and mails; better transportation facilities and cheaper money for the farmers.

These problems require an early solution. To solve them it is necessary that each and every Nova Scotian resolve themselves into individual boost committees. The farmers of Nova Scotia were not calling for work in times of business stagnation; their lot was thus much more pleasant than that of the urbanites.

A GREAT ERA OF DEVELOPMENT

Prof. M. Cumming who followed Mr. Margeson said: "It is a great thing to be a Nova Scotian and we feel it. Those of us who are young are just in the right era in Nova Scotia's progressive movement for development. The east is a mighty good place in which to live." He then went on to enumerate how the special agricultural grants received from the federal department were being expended. The work was done with a view to laying strong, solid foundations on which to build the future development of the agricultural interests of the province. The work of combating insect pests and plant diseases was accomplishing gratifying results.

He recommended the appointment of a plant pathologist for the province and made reference to the ban that had been placed by the United States and Cuba on potatoes from districts infected with powdery scab.

The 1914 Short Courses had been most inspiring and short courses as requested by a resolution passed at the 1913 Farmers' Association were to be held in several parts of the province.

The dairy industry had shown an increase of 49.8 per cent. in the province in 1913 over 1912. He asked the Lunenburg County farmers to stand by the LaHave Creamery and they would find it a mighty factor in the development of their county. t

PROF. J. M. TRUEMAN

was present and contrasted conditions in Nova Scotia with what they were when he left the Province twenty-three years ago.

DIRECTOR'S REPORT

Your Directors have no extensive report to make to this the Eighteenth Annual Convention of the Farmers of Nova Scotia.

This is the first time the Association has met ae Bridgewater and we look forward to a pleasant and profitable visit to this County of Lunenburg, and trust that the farmers in this district will benefit by the discussions and business transacted during the session here.

We are glad to record that since last we met, the Province of Nova Scotia has continued to flourish, and on the whole farming communities have had a fairly successful year, but from the fruit growers we regret to hear of a great shortage in fruit.

We are glad of the continued and progressive interest taken in the Agricultural College and the Short Courses held there, there being a larger percentage of pupils from Nova Scotia than heretofore attending. The regular Course and the Short Course was exceedingly well attended—one noticeable feature being the attendance of ladies at the First Womens' Institute Convention. Several of these Institutes have been organized during the past year under the capable organization of Miss Jennie A. Fraser, Superintendent. Of the Halifax Exhibition and other local exhibitions you will hear fully from your commissioners and others and also from Superintendent of the Agricultural Associations in relation to County Farmers' Association. Another new departure is that following the close of the Convention there will be open in various parts of the Province a series of Short Courses, meetings of two or three days each under the superintendency of the staff of the Agricultural College, so those who could not attend at Truro will be able to receive some valuable instruction at home.

The Maritime Stock Breeders' Association as usual held a very successful Horse Show in April and a Winter Fair in December.

The liberal appropriation by the Provincial Government together with the Dominion appropriation for the aiding of agricultural has enabled the Department to accomplish much in the interest of the Agriculturist. New lines of work have been started and others expanded, which will be of great benefit to the Province.

We have in Nova Scotia started at last to make more rapid strides in the matter of butter making at creameries. The increased output this year being 49 per cent. but there is room for a larger increase than this.

Three new creameries are now under construction that will begin operation in the Spring, and from now on more attention will be given to making a concentrated effort to enlarge the output of the ones now in operation.

We shall hear from the Superintendent of Dairying further upon this subject, and we are glad to have secured the services of Mr. Gearge H. Barr. Chief of Dairy Division, Ottawa, to address the convention along this line, and Prof. Trueman will tell how to feed to increase the product.

The resolutions you passed at your last meeting were duly attended to. The Parliamentary Committee will report the result of those they had to deal with.

The program of this convention is before you. We trust the subjects thereon found will be thoroughly and advantageously discussed and that we shall put more enthusiasm into our work this coming year.

The treasurer's report is as follows and has been audited by Mr. J. P. Landry and Prof. J. M. Trueman.

EXHIBITION COMMISSIONERS REPORT.

Mr. President, Officers and Members, The Nova Scotia Farmers' Association.

As your Representatives at the Provincial Exhibition Commission for 1913, we beg to report that we consider the exhibition for 1913, a success, comparing it with the last two or three years.

While there was considerable criticism about the main building not being up to the mark, yet taking every thing into consideration, it compared favorably with the previous years. While there was some very fine exhibits put on by some of the leading mercantile houses of Halifax, and outside firms yet it is very difficult to get busy firms who are behind with their orders to go to Halifax or any other exhibition, to put on a costly exhibit by way of advertising their goods.

In the Annex, one of the most interesting features was an educational display and Domestic Science demonstration by the Nova Scotia Agricultural College, Truro. Miss Jennie Fraser, Prov. Supervisor of the Women's Institutes, and Mrs. Dunback were in charge of the Domestic Science Demonstrations.

Then the demonstration work that was carried on by Mr. Harvey Mitchell, who has charge of the cow testing work in the Maritime Provinces, could not help but convince those that keep cows, of the necessity of keeping records of the amount of milk each individual cow gives then determining by the Babcock test the percentage of fat in her milk.

Mr. W. A. McKay, Inspector of Creameries, was there making butter, and in his very able manner teaching those interested in the proper way to make butter.

The Fishers and Mines Buildiugs were about the same as previous years.

The Agricultural building looked better than we expected to find it: there being a very creditable show of all kinds of roots, vegetables, grains, etc. Mention might be made of the Experimental Farm at Nappan, which put on a very fine exhibit of various products of the farm which were very tastefully arranged, also a splendid exhibit of roots and vege-

tables from the Nova Scotia Hospital, Dartmouth.

Considering the early date of the exhibition and the backwardness of the season, we consider the Agricultural building quite up to the average.

The Horticultural building, as far as the flowers, the canned and preserved fruits entered into the show, it would be hard to excell them in any Province. But again on account of the late season and the early date of the Exhibition, we consider the exhibit of fruit a detriment rather than an advancement, for our Province. For instance apple buyers and visitors get a very poor idea of the quality of our fruit; for they reason like this: "If this is the best fruit you can obtain for exhibition purposes then the quality of fruit from which this was selected must be very inferior:" and the impression such people get of the Nova Scotia fruit cannot be of very much commercial value to us.

The entries of Poultry, Sheep and Swine were very large, being well fitted and showing an abundance of quality throughout.

The horse barns were well filled, and all the horses came that were entered, there would have been only two empty stalls. Here again with very few exceptions the quality was good.

One noticeable feature was the number of new exhibitors, and in conversation with some of them, they seemed well pleased, several stated they would like to come next year and bring more stock if possible.

The cattle barns were well filled with Beef and Dairy Breeds, the majority of which showed careful fitting, and worthy of the name of show cattle in any country. Here again we find new exhibitors who were fortunate enough to carry off the much coveted Red Ribbons.

The horse racing was exceptionally good, there being many new performers who created new interest in the sport: and in conversation with Commissioner James A. Fraser, who is Superintendant of the speed department he told us everything went along without any frictions and no complaints, which speaks well for the management of the department.

The special attractions were most satisfactory: the flying machine proving a great drawing card.

Summing up the exhibition as a whole, we believe any fair minded man cannot but say that the 1913 Provincial Exhibition measured up quite favorably with previous ones.

Preparations for the 1914 Exhibition have been commenced. At the annual meeting held Nov. 19th. the date was fixed for Sept. the 9th. to 17th. At that meeting we were waited on by the Trades and Labor Council, asking for the free use of the race track and grand stand, for their Labor Day celebration which was granted. The Firemen also asked for the free use of the grounds for the purpose of putting on a tournament some day in August which was granted.

We are respectively, Your obedient servants,

Sgd. F. W. Foster.
Sgd. H. A. Kennedy.

Following the reading of the Exhibition Commissioners' report Thos. Aylward, Falmouth, one of the exhibitors at the Maritime Shows referred to a much need reform in transportation of live stock to and from exhibitions and in accomodation facilities for caretakers of stock while attending the exhibitions. He referred to the unnecessary delay that shippers of stock were subjected to and instanced the commodious comfortable quarters that the management of the Chatham exhibition has provided for the live stock herdsmen. The Halifax Exhibition Commission might well pattern after Chatham in this respect.

A lengthy discussion took place on ways and means of inducing a large number of stock breeders to show at Halifax. Some of the speakers though that a special class could be made for sweepstakes animals thus giving new beginners a fair chance to win in the open classes. J. A. Fraser, one of the commissioners thought the Sheep and Swine bars should be brought into more prominence on the grounds, instead of being tucked away in the most unacessable quarter of the grounds.

Professors Cumming and Trueman thought a four days show would be sufficient and would have a tendency to bring out larger and more numerous exhibitors.

Mr. Lee, Howard Kennedy, D. F. McLean, Wm. O'Brien, W. H. Woodworth, R. J. Messenger, Wm. Murray, A. S. McMillan, Wm. Sharp and others took an active part in the discussion.

THE REPORT OF SUPT. OF AGRICULTURAL SOCIETIES.

was given by Mr. F. L. Fuller. It showed that the Agricultural organizations in the province are in a flourishing condition. The Supt. showed the willingness of the Nova Scotia Department to co-operate with the Federal Department in the work of distributing pure bred sires in sections of the province where they were needed. In view of the fact that some agricultural society members have shown a tendency to drop out of their agricultural society and rely on the Federal Department for pure bred sires, the general concensus of opinion was that both Local and Federal Departments should work in unison so that the work done by the respective departments would not clash and leave the room for disgruntled society members to break down their Agricultural Society.

Messrs. D. Crockett, W. R. Barss, Prof. M. Cumming, Wm. Murray, H. W. Corning, D. F. McLean, Col. S. Spurr, S. A. Cook, F. W. Foster, A. S. McMillan, Jas. A. Fraser, Dave Findal and O. D. Wyley took part in the discussion.

REPORT OF COUNTY FARMERS' ASSOCIATIONS.

Annapolis County.—The season of 1913 was fairly favorable to the farmers of the county as a body.

Mixed farming has been proved beyond all doubt to be the surest and most profitable system for the general farmer.

The abundant crops of hay and of early grain well harvested and of roots cellared for the feeding of stock—the high prices of all products—the great demand for beef, pork, butter, cheese and in increasing prices with the available barn fertilizers all ten to make the farmer feel fairly content.

The apple crop was disappointing both as to quality and quantity yet those who sprayed early, persistently and thoroughly were rewarded with large crops of good, sometimes excellent fruit. The Entomological station at Bridgewater has proven a source of information to may in regard to the life and habits of many injurious insects. We are glad to learn that during the last three months a large force has been collecting and destroying the Brown Tail Moth which has increased rapidly during the last three years. We think farmers should be induced or compelled to spray.

We have at Lawrencetown a cheese and butter manufacturing Company which has adopted the cream gathering system for the fall and winter months. This Company has been in operation for some years. Owns its plant free from any indebtedness.

Our association had 152 members in 1913. Over twenty Institute meetings were held during the year.

Mr. L. D. Robinson of Berwick, J. M. Robinson of the Experimental Farm Kentville and C. F. Alward, of Havelock, were the speakers.

The Annual meeting of the first inst. was a success. The discussion animated a spirit of hope and an endeavour prevailed to profit by the experience and probably failures of the past.—L. W. Elliot.

Antigonish County:—The Antigonish County Farmers' Association had a very successful year. On March the 27th. and 28th. the Association held a Seed Fair. The sum of $131.-00 was paid in prizes. The quality of the exhibits shown was in the opinion of the Judges, Messrs. Fuller and Moore, of the Agricultural College, Truro, superior in almost every department. A notable advance was made in their opinion in the selection of seeds, cleaning and care of same. Some ten meetings were held and at them from 50 to 200 were present.

The Annual Fall Fair was held on Sept. 19th. and drew a larger attendance than for many years previously. The amount paid out in prizes and expenses in connection with the fair amounted to over $1100.00. The Association is on a good financial footing having about $250 on its credit. The question of erecting further buildings on the grounds was much discussed during the year by the managing committee but as some difference of opinion existed as to whether cattle sheds or larger exhibition buildings were more desirable the matter was postponed to be taken up by the coming committee.

The fair itself was largely successful. The exhibits of sheep and dairy cattle were larger than usual and horses showed up well. Roots, vegetables and fruits were hardly up to the standard, the fair having been held to early to permit of full maturity in many of these lines.

The annual meeting of the association was held on the 17th. of January instant. The question of holding a poultry show in connection with the seed fair was discussed and it was decided to hold both on the 2nd and 3rd. of February. A resolution was passed unanimously that an invitation be extended the Farmers' Association to hold their next annual meeting in Antigonish. This town is very well situated for this purpose being situated on the I. C. R. fairly central and has suitable accomodations for the purpose.

Mr. McPherson spoke at considerable length in the question of co-operation among farmers also of the drainage question, moved a resolution that the municipal council of Antigonish county be asked to pass a bye-law whereby money could be borrowed under the provisions of the Tile and Drainage Act to assist farmers in draining their lands. This resolution was commonly adopted.

Rev. Mr. Thompkins spoke of co-operation among farmers and was pleased that such an organization had been formed in Antigonish County. He thought it would be well to have a co-operative association among the farmers of the province. He therefore moved the following resolution which was to be placed before the Nova Scotia Farmers' Association at their first annual meeting "Resolved that steps be taken to form a Central organization representing the farmers of Nova Scotia for the purpose of co-operative purchase of fertilizers, seeds, feeds, and farming impliments." This motion was unanimously adopted. The following directors were appointed: A R. McAdam, John D. MacDonald, William Walsh, Geo. Taylor, John Brwon, A. S. McMillan, Wm. C. McIntosh, John Leyden, Rev. M. M. Doyle, F. R. Totter, Rev. Mr. Thompkins, Harry Eadie. At a meeting of the Directors held immediately afterwards, A. S. McMillan was appointed president, Rev. Dr. MacPherson, vice-

THE NEW MINISTER OF AGRICULTURE

Hon. J. A. Murray will Direct New Brunswick's Agricultural Policy

Hon. J. A. Murray, who returned by acclamation at the bye-election in Kings, New Brunswick, on Thursday last, will direct the Department of Agriculture in his native Province. Hon. Mr. Murray was a member of the government without portfolio and on the reorganization of the cabinet was called upon to assume control of the important department of which he will doubtless make a capable head. He is a business man of good judgment and being of an inquisitive turn of mind, may be looked to to thoroughly study the problems committed to his care. He is one of the best platform

Hon. J. A. Murray, New Brunswick's New Minister for Agriculture

speakers in the Maritime Provinces and is a "hale fellow" who sees the bright side of life. Mr. Murray is a farmer, in a small way, and has one of the best kept pieces of land near his home town, Sussex.

The Parliamentary Companion has this to say of the subject of this sketch; "Murray, James Alexander, (Kings) Son of John Murray, Scotch descent, and Caroline Mills, both Canadian born. Born, Nov. 9, 1864, at Moncton, N. B. Educated in New Brunswick schools. Married, Sept. 2, 1891 to Annie Kate, daughter of late John Mills, of Sussex, N. B. Children, one son and three daughters. Manufacturers Agent, Alderman-at-Large, Town of Sussex, acclamation, 1904-5. Mayor Town of Sussex, acclamation 1906-7. First elected to legislature March, 1908. A Presbyterian.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

THE PARCEL POST AND FARM PRODUCE.

Now that the parcel post system has been brought into operation it will provide a boon which has long been desired by the people of Canada. It gives the people facilities which the increasing business of the country so imperatively needs.

If the farmers are awake and alive to their new opportunities, they can easily start a direct trade with the city consumers, from whom they should be able to get somewhat better prices than they can from the middlemen, while at the same time the city dwellers should be able to get from the farmers far cheaper rates than they have had to pay to the city retail dealers.

The new parcel post may thus be a great public benefit; but it remains for the farmers to make its usefulness the largest and highest possible.

Apart from the enormous convenience which the new system promises as providing a cheap and ready method of transmitting parcels both between private persons and also between storekeepers and their country customers, it will besides open up a splendid channel of communication between the farmer and the consumer. The cost of food question at present is one with which all are intimately concerned, and many suggestions have been made with the object of providing a satisfactory solution of it.

With the advent of the new parcel system, there is no reason why much of the housewife's daily requirements should not be supplied direct from the farm; and it is announced that in connection with the regulations regarding the system there will be full instructions for farmers and others regarding the methods of sending farm produce, such as butter, eggs, vegetables and fruit. The farmer's wife may thus secure a direct route to the consumer for what she has to sell, and at the same time the town customer will escape the levy of heavy intermediate tolls. This departure has within it great possibilities which it remains for agriculture and city customers to develop.

One of the first things to be done, however, is for the farmers to take practical steps to let the city consumer know where they live and what they have to sell, otherwise full advantage cannot be taken of the new transmission facilities. Unless farmers take proper means in advance to supply this required information, the city consumer cannot reach them.

The Maritime Farmer will have a column specially devoted to advertisements of farm produce for sale. If you have butter, eggs or other farm products for sale that can be shipped by parcel post it will pay you to run a small ad. in our Farm Produce by Parcel Post Column.

FEEDING IN PROPORTION TO PRODUCTION.

That at least one farmer who attended the recent meeting of the Nova Scotia Farmer's Association, at Bridgewater, was benefited by Prof. Trueman's address on "Milk Production" is vouched for by a letter received from a prominent Lunenburg County farmer, which will be found on another page of this issue.

Prof. Trueman advised the farmers to increase the meal ration to their cows so long as they could see that the respective cows were giving a profitable response in increased milk production.

The letter in question states that the writer had returned to his home determined to give Prof. Trueman's plan a fair trial and sure enough at the end of the second days test the old cow began to show a response to the more generous treatment she was receiving.

We would like to hear from some other readers who have tried this plan.

It takes a certain amount of feed to sustain life and it is only the amount of feed that a cow will produce over and above what she requires to keep her body in a thrifty condition that she will convert into profit for her owner.

The cow is a factory on a small scale and the more raw material that she can consume the more profit will she make for her owner if she is the right kind of cow. The proper ues of the scales and Babcock test will soon tell whether you have the right cow or not.

THE N. S. F. A. ANNUAL MEETING.

We had the pleasure of attending the Nova Scotia Farmers' Association recently held in Bridgewater. The writer has attended every annual meeting of the Association held during the past ten years and is free to say that the Bridgewater meeting was the best he ever attended. The attendance was all that could be desired, the hall was well lighted, warm and comfortable, the addresses were not too long and the various speakers confined themselves to their respective subjects. The programme was well arranged and not too much crowded so that practically each session saw the completion of the work scheduled for that particular session.

The best of order and a due observance of parliamentry rules prevaled. These features and the feeling of optimism that was evidenced made the several sessions most profitable to the farmers of Nova Scotia.

BEECHER'S FARM CREED.

We believe that our soil loves to eat, as well as its owner, and ought, therefore to be liberally fed.

We believe in large crops which leave the land better than they found it—making the farmer and the farm both glad at once.

We believe in going to the bottom of things, and, therefore, in deep ploughing and enough of it. All the better with a subsoil plough.

We believe that every farm should own a good farmer.

We believe that the best fertilizer for any soil is spirit of industry, enterprise and intelligence. Without this, lime and gypsum, bones and green manure, marl and guano will be of little use.

We believe in good fences, good barns, good farm houses, good stock, good orchards and children enough to gather the fruit.

We believe in clean kitchens, a neat wife in it, a spinning wheel, a clean cupboard, a clean dairy and a clean conscience.

We firmly disbelieve in farmers that will not improve: in farms that grow poorer every year; in starving cattle; in farmers' boys turning into clerks and merchants; in farmers' daughters unwilling to work, and in all farmers ashamed of their vocation or who drink whiskey until honest people are ashamed of them.—Henry Ward Beecher.

LEGAL DECISIONS IN REGARD TO NEWSPAPERS

1. Any person who takes a newspaper regularly from the post office, whether directed to his name or another, or whether he has subscribed or not—is responsible for the payment.

2. If a person orders his paper discontinued he must pay up all arrearages, or the publisher may continue to send it until payment is made and collect the whole amount whether the paper is taken from the office or not.

3. The courts have decided that refusing to take newspapers and periodicals from the post office, or removing and leaving them uncalled for, is prima facie evidence of intentional fraud.

THE N. B. F. & D. A.

The Thirty-ninth Annual Convention of the New Brunswick Farmers' and Dairymen's Association will be held in the city of Fredericton on March 2nd to 6th inclusive, A good programme is being arranged. Many matters of vital interest will be discussed. Plan to be present, take part in the discussions and we can assure that you will return home feeling much refreshed and better able to cope with the problems that will confront you and your farm labors during the remainder of the year.

THE FIFTH MARITIME HORSE SHOW

The Fifth Maritime Horse Show will be held in the Winter Fair Building, Amherst, N. S.. on April 1st to 4th inclusive. The very best horses in the Maritime Provinces will be there. Everything to please the eye of the horse lover from the majestic Clydes and Percherons to the smallest ponies, will be so exhibited as to make the four days of the Show one continuous whirl of pleasant excitement. Don't forget the dates.

New Brunswick Fruit Growers in Annual Session

The Ninth Annual meeting of the N. B. Fruit Growers' Association was held in the Council Chambers of the City Hall, Fredericton, January 22nd and 23rd, 1914. Notwithstanding the bad travelling a good crowd was in attendance.

The meeting was called to order at 10 o'clock, a. m., January 22nd, with Mr. C. N. Vroom in the chair. Mr. Vroom stated that the season of 1913 was one of the poorest we have had for a number of years, and consequently the association was unable to hold the fruit show in St. John, as had been planned for November. However he hoped that 1914 would he a good season, and that a good show might be put on.

MANY NEW TREES SET OUT.

Continuing, Mr. Vroom said:—

"You will be glad to hear from the secretary of large numbers of young apple trees which have been set out in the province during the past season. Through his influence these have been of varieties suitable to our province, and thanks to the Horticultural Division of our Department of Agriculture a considerable assistance has been rendered in the proper setting and care of the new orchards. Soon we may hope that it will not be necessary as it is now, to import from the United States and other parts of Canada over 25,000 barrels of apples in a year to supply normal consumption. This means sending out of the province say $50,000 for this fruit alone, and it would certainly be much better to distribute it among our own farmers. One hundred farmers raising 250 barrels each would meet the requirements and this would necessitate only a small orchard for each. Where some are setting several hundreds of trees, the time ought soon to be reached, where at least our home market will be fully supplied with home fruit, which is the best fruit to be obtained, and can be put on the market in the best condition.

"I think you will approve of an expression of appreciation of the work being done by the Department of Agriculture of the local and Federal Governments for the control of the brown tail moth. This year these destructive insects have been found in great abundance near the border of the State of Maine, while they are to some extent spread over nearly the whole of the province. The moths are coming in large numbers from Maine, which is badly infested by the insect, and I am sorry to say that in that state efficient measures for their control have not been adopted. The gypsy moth is also making headway there, and working this way, and we may look for its advent here within a few years. These, with the insects we now have, will add emphasis to advisability of general spraying of fruit trees and a constant watchfulness.

"In conclusion, I have only to say that we have every reason for greater enthusiasm in the work of fruit raising. It is said that he who makes two blades of grass grow where one grew before is a public benefactor. But what may be said of him who fills our homes with the beautiful and delicious apple. He is doing a work for the physical and moral advancement of the community, while at the same time engaging in the most pleasing and profitable branch of agricultural activity. Success and great enjoyment to the fruit growers of New Brunswick and may their numbers speedily increase."

REPORT OF THE SECRETARY.

Mr. President and Members of the Association:—

I beg leave to report, not only for the year just closed, but also cancerning matters of previous occurence I think it advisable to take this opportunity of giving as briefly as possible, a few facts of historical record in connection with our association. The New Brunswick Fruit Growers' Association was organized at Amherst on December the 14th, 1908. The first regular meeting was held at Fredericton on January 27th, 1905; the third annual meeting at Fredericton, February 14th, 1907; the fourth annual meeting at Fredericton, January 24th, 1908 and the fifth annual meeting at Fredericton, January 14th 1909; in 1910 there were two meeting, one being held in Fredericton on February 24th and the second one being held in St. John from October 30th to November the 2nd in connection with the first New Brunswick Apple Show. The seventh annual meeting together with the second New Brunswick Apple Show took place in St. John from October 31st to November 3rd, 1911. The eighth annual meeting was held in Frexericton, February 1913.

The late Mr. J. C. Gillman was president of the Association for the first three years of its exitsence and his able leadership did much to place the Association on a firm basis. He was succeeded as president by I. W. Stephenson who held the office during 1908 and 1909. Mr. C. N. Vroom now acting President ably directed the affairs of the Association in 1910, 1911 and 1912. Mr. Henry Wilmot has acted as Treasurer of the Association since its organization in 1904.

PREVIOUS SPEAKERS.

In addition to our own members, who have taken active parts in the meetings, we have been much indebted to the following speakers: From Ontario, Mr. A. McNeil, late Chief of the Federal Fruit Division; Mr. W. T. Macoun, Dominion Horticulturist, and Professor J. W. Crowe; From Nova Scotia Professor Shaw of the Agricultural College, Truro; Professor W. S. Blair, of the Experimental Farms at Napan and Kentville and Mr. R. W. Starr, the pioneer of Nova Scotia fruit industry. From our own Province, Mr. Wm. McIntosh, of the Natural History Society, St. John and Dr. Hamilton now at MacDonald College, formerly of the Normal School, Fredericton.

In the death of Mr. McNeil who was chief of the Federal Fruit Division and at one time President of the Ontario Fruit Growers Association. This Association and the Fruit Growers of all Canada have lost a strong friend and warm advocate, one who was at all times most unselfish and earnest in his efforts to improve their welfare.

ANNUAL REPORTS.

Our annual reports have been included in the Annual Reports of the Department of Agriculture with the exception of those of 1911 and 1912 which were included in the Annual Reports on Horticulture. These annual records of the Association's work from 1905 to 1910 inclusive total about 221 pages, and I think that the Association should make an effort to have them republished in a single volume, in an edition of about 500 copies. By doing this the complete records of the association will in time to come be available to all desiring them.

INCREASE IN MEMBERSHIP.

The record of membership shows progress, being as follows: In 1905, 34 members; 1906, 37 members; 1907, 37 members; 1908, 30 members; 1909, 24 members; 1910, 79 members; 1911, 115 members; 1912, 72 members; 1913, 115 members.

GOVERNMENT ASSISTANCE.

Commencing with the year 1910 our Association took on a new lease of life and largely extended its activities. This was made possible by the creation in that year of a horticultural Division under the Provincial Department of Agriculture and I am sure that all our members heartily appreciated such recognition on the part of the Government of the importance of fruit growing in New Brunswick. Generous financial assistance from the Government in the form of annual grants of $500 for prize money and in the payment of many other expenses made possible the holding of large apple shows in St. John in the fall of 1910 and 1911, the first of their kind in New Brunswick.

CO-OPERATIVE PURCHASE

In 1911, the Association commenced the co-operative purchase ol fruit trees for distribution to its members and in that year distributed 7,300 trees at a cost of 21 cents and 22 cents per tree; in 1912, 15,8000 trees were distributed at prices ranging from 23 cents to 25 cents and in 1913, 12,110 trees were distributed at prices ranging from 23 cents to 25 cents. Where complaints were received of unsatisfactory conditions and quality of trees supplied, investigations were made by an official of the Horticultural Division and refunds made according to his report. As the bulk of trees placed throughout the province by agents are sold at prices ranging from 30 cents to 45 cents and even as high as 50 cents per tree it is easy to see that the Association is saving its members hundreds of dollars through this co-operative purchase of nursery stock.

It became evident that if the good work of making co-operative purchases of fruit trees was to be continued more funds would have to be provided in order that the Association might obtain the special discounts by making cash payments pending the collection of the accounts due from the individual members. I therefore made application to the Honorable Dr. Landry, Minister of Agriculture, for the purpose of enabling the Association to better carry on the work supplying its members with fruit trees, spraying materials and other supplies at the lowest possible prices and I am sure that every member will he pleased to learn that the application was granted and that this amount namely, $500 was placed to the credit of the Association.

In the purchase of nursery stock the Association has always aimed to give the preference to and encourage home nurseries. In 1911 and 1912 a considerable amount of stock had to he imported as it was not possible to obtain it in the Maritime Provinces. For the last four years members of the Fruit Growers' Association and the Horticultural Division have been supplying the nurseries in New Brunswick and Nova Scotia with buds and scions taken from the good bearing trees in this province of the varieties most in demand. Consequently there are now available practically twice as many Maritime Province grown trees of such varieties as the McIntosh Red, Fameuse, Bethel, Dudley, Wealtny, Alexander and Wolfe River, as there were three years ago. This made it possible to obtain a much larger quantity of home grown trees for 1913 planting., and the great bulk of the trees being purchased for 1914 planting are New Brunswick grown stock.

A small quantity of spraying materials consisting of lime sulphur and lead arsenate were purchased and distributed to members in 1911; in 1912, spraying materials to the value of $515 were distributed and in 1903 to the value of $625. These spraying materials have been distributed at cost price and the introduction of their use by our members is resulting in a more general adoption of spraying.

APPLE SHOW IN 1914.

Early in 1912 the Association decided to hold no apple show that year and the members were consequently looking forward with murh interest to the nolding of a show in 1913. While the season opened with a good showing of hloom, the set of fruit was only fair and the apples continued to drop into late summer. What at first promised to he a good apple year proved as had a year as the province has experienced for a long time and the fruit growers were practically unanimous in their decision to postpone the apple show until 1914. While this decision was much regretted yet its necessity was much generally recognized and I am sure that all our members are this comiog fall, and that they are looking forward to holding a show determined to use their best efforts towards making a still greater show and success than that of 1911.

I believe that if we decide to make the apple show a biennial event, the Government may be prevailed upon to increase the prize money grant from $500 to $750 and this extra inducement of course would tend to bring out a greater exhibition. I would also suggest that this association should make a splendid exhibit irrespective of the exhibit and competition. Let every member who is growing apples contribute some fruit, any amount from a basket full to two boxes, and let all this fruit be blended into one special trophy, to he sold after the exhibition and the proceeds devoted to furthering the work of the association as its members deem best. Such a trophy would he a splendid advertisement for the Asaciation, add materially to the extent and success of the exhibition and improve our financial position.

In conclusion I would say that we have reason to feel much encouraged at the progress already made but there are a great many things which we could help to do towards the extension and improvement of fruit growing in New Brunswick. These things cannot he accomplished without hard work, individual self-sacrifice and effort. I cannot urge too strongly the necessity of each and every member taking as active a part as possible in the work of the association as only in this manner may the largest and most beneficial results be obtained.

Mr. S. B. Hatheway congratulated the association on having such an able secretary as Mr. A. G, Turney, and moved him a vote of thanks which was seconded by Mr. Herbert Smith.

MAYOR HOOPER WELCOMES MEMBERS OF ASSOCIATION.

In very fitting remarks, Mayor Hooper welcomed the N. B. Fruit Growers to the city of Fredericton.

Continued on page 306

Nova Scotia Farmers in Annual Session

(Continued from page 289)

president and Allan MacDonald, Secty. treasurer.

Sgd. Allan MacDonald,
Secty. Antigonish Co. Farmers Asso.

Cape Breton County—R. M. Jackson reported for Cape Breton county. They had held a very successful exhibition in Sydney. The demonstration plots of turnips conducted in various parts of the county during the past season were destined to produce good results.

Digby County—D. C. McKay reported for Digby county. The farmers in the vicinity of Digby are getting together on the question of co-operative purchase of fertilizers, seeds, etc. Several new creameries have been established during the past year.

Hants County—The progress of Hants County was reported by Wm. O'Brien.

Inverness Copnty—D. F. McLean reported for Inverness county. The seed fair which was inaugurated there last year, under the auspices of the Association had been successful beyond the most sanguine expectations of its originators.

Kings County—The Kings County Farmer's Association has had another prosperous year. Twenty-seven meetings were held with an attendance of 920. The lecturers were Prof. W. S. Blair, of the farm, Kentville, who kindly consented to address meetings for two weeks. This was done without remuneration from our Association. Mr. S. C. Parker also assisted for six meetings and was paid by our Association. The secretary addrtssed every meeting held. The balance on hand January 1913 was $81.68. At the annual meetjng Roy Blair spoke on "Potato Growing" and Mr. A. E. Adams of the United Fruit Company lectured on the "Marketing of Fruit" under co-operation.

On June the 24th, the Association ran an excursion to Truro College Farm and 1,000 people took advantage of the cheap rates to visit Truro W. H. Woodworth reported.

Lunenburg County.—In giving a report of the Lunenburg County Farmers Association for 1913, I am pleased to report a year of progress. Our membership being 222, the largest since organized, out of this number 178 are subscribers to The Maritime Farmer, a paper that every farmer should have in his home. During the year fourteen meetings have been held under the auspices of the said Association with a total attendance of 856. Twelve of these meetings were addressed by Mr. C. F. Alward, a practical farmer, of Havelock, Kings Co., N. B., who was sent to us by Mr. F. L. Fuller. He was well versed in his several subjects, has been extensively engaged in farming, with an extensive knowiedge along the different phases of the dairy interests. He advised the building of a butter factory and co-operation in the dairy business. I believe his address had much to do with the starting of a butter factory in Lunenbury County, which is now nearly finished. Prof. Cumming and Mr. W. A. McKay also addressed meetings at different places in our county advising the farmers to build a creamery and Mr. McKay has rendered valuable assistance toward the building of the said creamery.

We are desirous that 1914 will be a prosperous year for our county, as well as for the whole province. — J. D. DeLong reported.

Pictou County—Howard Kennedy reported briefly for Pictou County.

Queens County—Mr. Freeman reported progress in Queens County. Two apple warehouses had been established and milk testing was being systematically done for the members.

Yarmouth County—Mr. Porter reported a year of progress in Yarmouth County. The new creamery is meeting with good success and the county in general is prosperous.

A RESOLUTION COMMITTEE consisting of Wm. O'Brien, R. M. Jackson, Fr. Tompkins, R. J. Messenger and Rev. Mr. Lewis was appointed to receive and introduce the various resolutions that might be presented.

ON WEDNESDAY AFTERNOON the Legislative Committee presented the following report.

"Your Committee in February 1912 appeared before the Agricultural Committee of the House of Assembly, Halifax, and presented the Resolution passed by the Association at its annual meeting at Sydney, or rather those passed which would be dealt with by the Committee. Since your members will probably wish to know the outcome of result of passing these resolutions we will mention each one and as far as possible note the action taken thereon :

"A resolution asking that the duty be removed from Traction Ditcher outfits coming into Canada. This was a resolution, with many others, passed by organizers all over Canada and as a result of this general petition as you all know this duty has been removed.

"A Resolution requesting an investigation into the working and financial standing of the Maritime T. & L. Co. A committee was appointed to do this work, whose report you will doubtless hear later.

"A Resolution asking for five district exhib tions in different parts of the province. This has been very well provided for by the act passed allowing the combination of two or more counties and their individual grants for such a purpose on the agreement of the Municipal Council, and of Agricultural Socicties that such should be done.

"A Resolution re the distribution of short courses throughout the Province in addition to the one at Truro This has been done and one will be put on in Yarmouth Co next week. Several others will follow in other

AUDITORS' REPORT

We have investigated the affairs of The Bank of Nova Scotia, and certify that the above Eighty-second General Statement in our opinion presents a fair and conservative view of the condition of the Bank as at the close of business on December 31, 1913.

Our investigation included an examination of the general books of the Bank as kept at the offices of the General Manager in Toronto, and an investigation and compilation of figures from certified returns made by its various branches. We further verified by count and examination the cash on hand at the offices in Halifax and Toronto, King Street, and inspected all securities owned by the Bank excepting those held at St. John and Havana. In verification of the securities held at these two branches certified statements were forwarded to us.

"MILK PRODUCTION"

was the theme of an excellent address by Prof. Trueman. Prof. Trueman is a convincing speaker, who confines his theories to what he has been able to accomplish in many years of actual practise. His address will appear in a future issue.

Prof. Trueman received a hearty welcome from the farmers of Nova Scotia. They are heart and hand with him in his work.

A REPORT OF DAIRYING IN NOVA SCOTIA

was given by W. A. MacKay, Dairy Supt. Mr. MacKay is doing things in Nova Scotia and he commands the confidence of every cow owner and dairyman in the province. His report will be published later.

ON WEDNESDAY EVENING

Mr. Geo. H. Barr, Chief of the Dairy Division, Ottawa, delivered an address on "Some Phases Affecting the Dairy Industry in Nova Scotia."

Mr. Barr took occasion to congratulate the Lunenburg farmers on the splendid creamery they are establishat Bridgewater. Extracts from his address will appear in a future issue of the Maritime Farmer.

WOMEN'S INSTITUTES

was the theme of a well prepared address by Miss Jennie A. Fraser, Superintendent of Women's Institutes for the Province. Miss Fraser received a well merited ovation and her work is sure to result in the betterment of the farm homes of the province. Read her address in our next issue. You will be convinced that Miss Fraser is the right woman in the right place, and that in appointing her to her present position, Prof. Cumming has exercised his usual good judgment in the selection of members for his staff.

THURSDAY MORNING

ELECTION OF OFFICERS

President—Wm. O'Brien, Windsor Forks.

Vice-President—A. S. McMillan, Antigonish.

Vice-President—R. S. Starr, Port Williams.

Directors—Samuel Freeman, Amherst; Wm. Murray, Union Centre; Wallace Rhodenizer, Bridgewater; D. R. Nicholson, Coxheath; D. C. McKay, Digby.

Auditors—Prof. J. P. Landry and Prof. J. M. Trueman, Truro.

Exhibition Commissioners—Howard Kennedy, Alma; and W. W. Black Amherst.

The meeting went on record as being ready to co-operate with the work that Miss Fraser is doing for the betterment of the homes of the province.

ON THURSDAY AFTERNOON

the Resolution Committee reported. After the resolutions which will be found below had been passed Prof. Cumming gave a talk on Stallion Enrollment and the work that has been so far accomplished along this line in Nova Scotia. He submitted the question of optional inspection to get the concensus of opinion of the members present. Considerable discussion took place but no decision was rendered.

Why Not Cut Off the Two Cars of Filler?

It takes 400,000 cars to carry American Fertilizers to our farmers and planters every season. Forty per cent.—2 cars out of 5—of this stuff is Filler, which requires 160,000 cars! Order less filler, higher grade and

Nitrate of Soda

for your active Nitrogen and save freight bills.

The greater productive capacity of high-grade fertilizers without so much filler means a greater outbound tonnage for railroads and greater purchasing power for farmers, so that railroads and everybody would be benefited.

DR. WM. S. MYERS, Chilean Nitrate Propaganda
NO BRANCH OFFICES 25 Madison Ave., New York

"RENOVATION OF OLD ORCHARDS

was the subject of an interesting, instractive talk by Prof. P. J. Shaw, of the N. S. A. C. Extracts of his address will be published later.

ON THURSDAY EVENING

the first subject on the docket was an excellent address by W. W. Baird, Superintendent of the Nappan Experimental Farm, on Soil Cultivation. Extracts from Mr. Baird's address will appear in a future issue.

Prof. W. S. Blair, of the Kentville, Experimental Station gave a general talk on matters of interest to every farmer present. How to stop the leaks, that drain our farms of both fertility and of our young people was ably handled by Prof. Blair.

Nova Scotia Dairymen in Annual Session

The second annual convention of the cheese factory and creamery men of Nova Scotia was held in the Agricultural College, Truro, during the term of the recent short course. There were about 25 men in attendance representing the dairy industry from one end of Nova Scotia to the other.

D. W. Murray, President of the Scotsburn Creamery was appointed chairman, and J. W. Hebb, Secretary Treasurer of the LaHave Creamery Company, Secretary.

Principal Cumming, Secretary of Agriculture gave a short address expressing his pleasure at the progress that dairying had made during the past year and of the excellent representative delegation that had gathered together to still further the interests and assured the convention of the continued support of the department to all that pertained to the advancement of dairying.

W. A. MacKay, Dairy Superintendent, gave a report of the year's work showing that the creamery output had increased about 50 per cent over the previous year. That three new creameries had commenced operation, and each had a successful season. The two new ones that began in 1912 had both trebled their output in 1913. At the present time there are three new ones under construction that will be ready for operations in the spring. A Dairy Herd competition was held the report of which will be published later.

A discussion took place on co-operation in buying supplies for the cheese factories and creameries, but no action was taken.

Mr. C. W. McDougal, Dairy Superintendent for New Brunswick gave an excellent talk and demonstration on the use of the acidimeter, showing the value of it in the manufacture of butter and cheese and advising all cheese factories and creameries to adopt it, during the coming season.

Mr. Harvey Mitchell, of the Dominion Dairying service dwelt on the importance of the improvement of dairy herds, this being the vital part of the dairy industry. He pointed out the assistance that was being rendered by the Department in the contesting work and asked for the support of all the factory men towards making the work more general.

Mr. Robert T. Stewart, the sec.-manager of the Scotsburn Creamery Company, Limited, dealt with creamery book-keeping in a most efficient manner, dealing fully with the system as adopted by the Scotsburn Creamery and recommending the advisability of all creamery and cheese factory men adopting some such system thus ensuring more confidence in the business and one of the principles that go to make creamery work a success.

Good discussions followed all the addresses and much good was derived from all meeting together.

As this was the second convention gathered together by the Dairy Superintendent, it was considered wise to now make this an annual affair and that the dairymen become united it was decided to organize an association to be known as the Nova Scotia Dairymen's Association. The following officers were appointed:

President—D. W. Murray, President Scotsburn Creamery , Scotsburn N. S.

Vice-President—R. B. McLennan, Manager Brookfield Creamery, Brookfield.

Secretary—W. A. MacKay, Truro, N. S.

These three to form the executive and arrange for the next annual meeting.

Votes of thanks were passed to Messrs. C. W. McDougal and Harvey Mitchell for the excellent addresses and after passing the following resolutions the convention adjourned, all of the one mind that dairying was coming to its own in Nova Scotia.

Your Resolution Committee beg to submit for your consideration:

That this Nova Scotia Dairymen's Convention here assembled desire to place on record their appreciation of the valuable work done by the Dairy Division of the Dominion Department of Agriculture in connection with the work of herd improvement and realizing that the production end is the weakest part of the dairy business in Nova Scotia, we would urge upon the Department the importance of extending the work, and that a copy of the resolution be forwarded to Mr. J. A. Ruddick, Dairy Commissioner, at Ottawa.

(Signed) W. A. MacKay, F. W. Bishop, Robt. Stewart, Resolution Committee. 1

* * *

Resolved, that the Convention here assembled desires to express its appreciation of the services rendered during the past year by Mr. Harvey Mitchell, of the Dairy Division at Ottawa, to the dairying in the Province and wishes that a copy of this resolution be forwarded to Mr. J. A. Ruddick, Commissioner at Ottawa.

* * *

Resolved, that this Convention here assembled desires to express its appreciation of the fact that out of the Dominion Grant an amount has been set aside for Dairy Education and further of the excellent results that have occurred from the expenditure of same and further resolved that a copy of this resolution be forwarded to Hon. Martin Burrell, Minister of Agriculture and Dr. C. C. James, Agricultural Adviser at Ottawa.

* * *

Resolved, that having been asked to mave suggestions as to the most effective educational work that could be done for the advancement of dairying in Nova Scotia, we are convinced that nothing would be equal to a competition for the highest production of milk and butter fat of herds supplying milk and cream to the various cheese factories and creameries in Nova Scotia, and that we would recommend that, if the Act could be interpreted as bringing a Competition of this kind within the scope of Dairy Education, a sum not to exceed $500.00 be set aside and apportioned to the various factories for this purpose.

* * *

Resolved, that the suggestions outlined in the discussions of this afternoon respecting Legislation be approved by this Convention.

* * *

Resolved, that we approve of the suggestiob of our Dairy Superintendent, Mr. W. A. MacKay, that a practical butter and cheese maker be appointed as Assistant Instructor and Inspector, whose time will be employed, in so far as may be desirable in assisting in our factory operations.

* * *

Resolved that this Convention appreciate the deep interest taken by our Provincial Government in the

Ask yourself this question:—
Why should any piano be called

"Canada's Biggest Piano Value"

Now think! That claim must either be true or not true. Twelve hundred Canadian families proved its truth to their own satisfaction last year. They made a thorough investigation, and satisfied themselves beyond any reasonable doubt, that the

Sherlock-Manning 20th Century Piano

Style 105

was one of the world's few great instruments — by all odds the world's best piano at the price. So they endorsed our claim in a practical manner by buying 1,200 Sherlock-Manning pianos. If you are thinking about buying a piano why not investigate our claims for yourself! Just write, asking us to prove two points to you: First, that the Sherlock-Manning is "Canada's Biggest Piano Value" Second, that the Sherlock-Manning is one of the world's best pianos.

Important: We'll prove these claims true and show how you may own this superb instrument and save $100. Write today.

Chamberlain's Cough Remedy is famous for its cures, and is pleasant and safe to take. For sale by all dealers.

Dairy interests of our Province, and the excellent work being done by our Dairy Superintendent, Mr. W. A. MacKay, who is untiring in his efforts in that direction, and especially Principal Cumming, whose zeal is a constant inspiration to the farmers and under whose inspiration as Secretary for Abriculture, our Province is making rapid strides.

(Signed) F. W. Bishop, Robert Stewart.

A Convert to Better Feeding.

Editor The Maritime Farmer:—

The recent Annual meeting held in Bridgewater, was, without doubt the best ever held. Each speaker had something to say, that would very materially help any farmer who had a mind receptive enough to grasp the truths and who would try to help himself. Prof. Trueman's address on Breeding and Feeding the dairy cow was the best I ever listened to and since I returned home I have decided to put in practice some of the ideas set forth in his address. I concluded that it would be a wise move for us to better feed the cows we have before going out to buy high priced cows.

Many people think that if they coufd get a pure bred dairy cow they would get all the milk and butter they would wish for. Yet these same people would not treat a pure bred cow any better than a scrub. They would run her out of doors eating old fag until the ground freezes up and when they stable her they feed nothing but hay that is of such poor quality that it is not good enough for the horse and the oxen. As a result they only get a very small flow of milk and very soon they condemn the breed.

I have a ten-year-old Jersey cow that has raised eight calves, seven of which were heifers. One of these heifers, at four years of age made by actual test in the month of February fifty-two pounds of butter. The old cow has been making over three hundred pounds of butter each year. She freshened on the first of October, 1913 after which she gave thirty lbs. of milk each day for four months.

After using milk and cream for the family we have churned one hundred and ninety-six pounds of butter. How is that for a scrub cow, on half feed? I have started to increase her feed and in two days she has increased her milk flow by two pounds which is a clear indication to us that she will respond to more generous feeding.—W. R. Barss, Lunenburg Co. N. S.

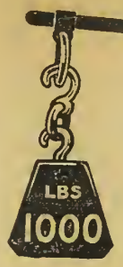
Editor's Note:—Our friend Mr. Barss has a good cow and we will be pleased to hear later as to the extent to which she responded to better feeding. Let us have experiences along this line from some other readers.

C. P. R. Farm at Fredericton Junction Under new Management.

Mr. A. A. Campbell, of Quebec, an expert agriculturist has been appointed manager of the C. P. R. demonstration farm at Fredericton Junction and will take over his new duties immediately.

Mr. Wm. Illingworth, who has been manager of the farm since it was taken over by the C. P. R. recently resigned.

The control of the demonstration farm is now vested in Dr. Ruther, ford, the director of the C. P. R.'s animal husbandry division, who visited Fredericton Junction with other C. P. R. officials a week or two ago.



INTERNATIONAL STOCK FOOD is a splendid Pork Producer

The successful hog-raiser is the man who bends every effort to prevent disease and—KEEP HIS HOGS HEALTHY.

He provides his hogs with warm, clean quarters—and adds a little "INTERNATIONAL STOCK FOOD" to every feed.

This wonderful tonic keeps the blood pure—regulates the bowels—makes the animals eat well—and thus fortifies them against those banes of the breeder—Hog Cholera and Pneumonia.

3 FEEDS for ONE CENT

You can easily raise "Fall Pigs" and have them fine and fat for the market in May or June, if you feed "INTERNATIONAL STOCK FOOD."

Your sows will raise TWO GOOD LITTERS of strong healthy pigs EACH YEAR if you feed INTERNATIONAL STOCK FOOD. For fattening pigs for market, at the rate of 2 to 3 pounds extra a day, there is nothing in the world to compare with it.

The big hogs—prize winners, weighing from 500 to 600 pounds—are regularly fed "INTERNATIONAL STOCK FOOD." Why don't you feed it and make more money out of your hogs? 3 Feeds for one cent. For sale at all Dealers.

Keeping Pigs Healthy.

In conversing with farmers upon the subject of pig raising at least cost and highest profit, I find that the experience of most of the farmers engaged in this pursuit is that it is more difficult to raise and finish pigs profitably in winter than in spring: it is harder to keep them healthy and pushing up to the high mark of the finished proddct at this time. We have found this to be true in our experience. Provisions to lessen the difficulty often are not so far distant but what we might grasp and ultilize them to our profit if we only thought of them.

Contrive to keep pigs comfortable and they will grow into money right along. If they are not comfortable, they cannot be as healthy as they be. If you wish to keep them at this point there are three positions from which you must accomplish it, sleeping quarters, feed lot, and range, each one of which has its particular function to perform.

SHELTER, OR SLEEPING QUARTERS FIRST.

I mention this first, for, if pigs are not properly sheltered, the feed lot (which, by the way, should be feeding floor) is worth little and any quantity of valuable feed is wasted, with corn worth from 70c to 80c per bushel, too.

At this point, mistakes are often made. We have made them ourselves, and so that others may profit by ours I shall write of them. The beginning of the mistakes were in usin a portable pen on runners which we made. It had a broad floor, was tightly sided, sloping to the rear with door in front, pen very low and about ten or twelve feet in length. Cozy, snug and warm, were our satisfied thoughts of the thing.

We lodged twenty pigs just weaned in that pen, and, though the snow was piled high and the cold severe, we were satisfied that our pigs were snugly housed. In spite of this the pigs began to drop and half of them died, but not before we changed them to different quarters.

Disease has fastened itself upon them. It was some plumonary disease. The mistakes were: Too many pigs in pen of small dimensions, pen was to close and too warm, circulation of air imperfect, air became foul and diseased, pigs overheated, came out into snow and cold air to get their feed and caught cold and half of their number was reduced in thrift and stamnia, and the other half died because of our mistakes.

Another foolhardy thing is to allow pigs, or hogs to nest in a strawstack or a heated manure heap during the night and then in the morning rush out steaming and sneezing into the cold air. If you allow such conditions to exist don't be surprised if some plumonary disease which finally proves fatal, is contracted. Dry bedding often changed, in dry quarters, warm, yet with a free circulation of air, is what is required by pigs in winter.

THE FEED LOT OR FEEDING FLOOR.

All farmers that raise pigs should have a feeding floor for sanitary reasons and the saving of feed as well. I have seen corn thrown into feeding pens knee deep to the hogs in mud, and the hogs were obliged to root after it up to their eyes. Corn "coated" with mud is a nasty pill to swallow and profit is hard to dig out of the mire.

A good feeding floor without those distressing little leaks in it will save the farmer more feed in a year than it cost him to maintain the floor, not considering the more rapid gain and heavier weight of the hog at its finish.

THE RANGE.

Pigs certainly need exercise. It is absolutely necessary for the maintenance of their health, for the prevention of that common ailment thumps, with which the farmer has to contend. This is caused by overfeeding and lack of exercise—activity insufficient to work it off.

Sows that are fed corn while nursing pigs are apt to produce thumps in their young, especially if held in close confinement. Corn should not be fed to nursing sows to any great extent but slops of a laxative nature should be given which will cause the bowels to be active in the small pigs.

The crop of pigs depends largely upon the care of the brood sow. The origin is the basis which determines what subsequently shall be, thus it is advisable to breed only from prolific stock. Out of the many types of brood sows those should be selected that show strong indication of a large growth and promises fair of having, when needed, ample room to carry big litters. The kind that have the reputation of being from a prolific and easy keeping family.

Usually the homliest sows prove to be the most prolific and best mothers.

The kind that are closely built and chubby, with no stretch of size, are the kind the experienced hog raiser discards if large litters are desired more than showy stock, for he knows that this type does not farrow big litters as a rule. But the sow, however ugly looking she may be, that has a large and even litter of pigs at her side takes my eye as the good sow, and the vast majority of farmers have found this type to be truly "the mortgage lifter" of the farm.

The experienced pig raiser is not above counting the teats of the sow he anticipates breeding. He knows that if she is to produce large litters she must have a sufficient number of teats. It will not avail anything for her to have more pigs than she can suckle. He also looks carefully into the matter of disposition. He does not care ta have a sow that has farrowed a large litter, kill the majority of them through her nervousness or viciousness, or to be so clumsy that she will lie down on them and kill some in that way.

Briefly, here are a few essentials that are the price of profit in hog raising, such as cleanliness, exercise, sunlight, perfect ventilation, dry quarters, and a balanced ration of feed with plenty of water as pure as can be had, charcoal, wood ashes and salt. If we are careful as to these, seeing that they are provided I cannot see why we should not succeed in this pursuit as well as the most experienced of them.—J. A. Fraiser.

Eureka Potato Planter

Catalog sent free

No matter whether you grow large or small quantities of potatoes we have a size of planter that is just what you need. The Eureka line of Potato Planters is the largest manufactured. This machine takes only *one* man to operate it. That means less trouble and expense for *you*.

Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if desired)—covers up—marks for next row.

It's an easy machine to operate. The steel and malleable iron construction mean lightest possible weight and increased life of machine. Your repair bill will be practically nothing. Plants uniform depth at *all* times because plow is directly under the axle. Dropping mechanism in plain view of driver. Does not injure seed.

We supply planters in three sizes, for one or two rows—with or without Fertilizer Attachment.

For 15 years the Eureka Potato Planter has been successfully used throughout the world.

We also make Eureka Potato Cutters and the Eureka Mulcher and Seeder—a mulcher, smoothing harrow, cultivator, weeder, seeder.

Book for Men, Free

8,000 Words, 30 Illustrations

TO MY READERS:

Of the little illustrated advice book described below, which I gladly send free to all men who fill in the coupon. I beg to say that it represents the very BEST information of a private nature which I am able to offer you as a result of over 30 years' observation and study of my subject, during which time I have personally interviewed many thousands of men, young and elderly, single and married, rich and poor alike, who came to me in confidence with their confessions of debility, lost nerve force and failing strength.

It is, reader, this vast and unusual opportunity which has enabled me to compile this very popular and valuable little free book (over a million of which have been sent everywhere to men who wrote me for them), and in a manner to reflect the exact living, breathing experiences and needs of real men who sought information as to the newer ways of self treatment without the use of drugs.

Remember, this book of over 8000 words and 30 illustrations will come to you by return mail in reply to your request, and in a perfectly plain, sealed envelope, for it is no one's business but your own what the envelope contains. There is absolutely no obligation on your part to buy anything or pay anything, and merely the receipt of this book which does not mean in any way that you are to use one of my VITALIZERS (see description below) and, in fact, only a portion of the book has any reference to the VITALIZER at all. Primarily it is a compendium of useful information for private reference, which you and all other men may easily profit by through life.

Therefore, please use the coupon, or if nearby, I should be very glad to have you call.

SANDEN, AUTHOR.

MANLY MEN MOVE THE WHOLE WORLD

It is a fact, reader, which you and I must recognize and admit, that the whole world admires and is fascinated by strong, vigorous, husky, manly manhood, and we must also admit that it is this same manhood and this alone which is back of the real leaders and producers in every walk of life. No matter where we go, we find it to be the manly, vigorous, vital fellow who forges to the front, who fascinates men and women of his community, who does the really great things. An unmanly man merely means nature's laws gone wrong, for it is he who halts and hesitates, who takes the back seat, who does not fit into the picture in a way that a manly, vital nature should. And yet, reader, it is my firm believe that any man, no matter what his past, no matter what dissipations or follies may have left their mark upon his physical and mental being, I say to you that such a man, unless there be some unusual reason, may hope for a complete return of his strength, vigor and self confidence, if he but go about his self restoration in a natural commonsense way.

I make a little appliance which we will call a VITALIZER, because I think that is the best word to describe its strange power. I don't want you to think of getting one of these VITALIZERS just now, but I would like you to investigate my claims as to what I believe can be accomplished by almost any weakened man who uses this VITALIZER faithfully for a few weeks. I speak, of course, of him who is willing to give up dissipation and lead a decent, conservative life, not only while using the VITALIZER, but for the future. The other kind of man, the dissipated, can hope for nothing from any treatment, no matter what it may be, hence such a man is eliminated from my consideration.

This little VITALIZER is made to wear upon the body all night. It weighs only several ounces and is no more unhandy than any ordinary belt, yet it generates a great FORCE that I call VIGOR, which flows inio your blood organs and nerves while you sleep. Men say it often takes any pain or weakness out of the back in one application, and that 60 to 90 days' use has been sufficient to restore manly strength and to put men in the "never felt better in my life" class. Special attachments carry the FORCE of the VITALIZER to any part of the body, for the use of women as well as men in cases of rheumatism, kidney, liver, stomach, bladder, disorders, ete.

Over two hundred thousand of these VITALIZERS have been used or are now being used by men all over the world.

You had better learn more of this VITALIZER. It is fully described in my free book. If you live near me, why not call and test the VITALIZER yourself.

WHAT THE FREE BOOK TELLS

The free illustrated advice booklet mentioned above is meant to be a single declaration of certain important truths that every man in the world should know. The day has gone by when men are kept in ignorance of the real problems pertaining to these private subjects, and this illustrated advice booklet, which I send to men sealed, by mail, gives certain important facts relating to sex, just as these facts are. The booklet also fully describes my VITALIZER and you are told how you may get one for your own use if you decide that you want one. Please use coupon below, or call. Hours 9 to 6.

The Maritime Farmer
SUSSEX, N. B.

few animals in the flock. The treatment for this form of foot-rot consists first in carefully trimming the foot or feet. If pus has formed, give an exit for it at the lower surface of the foot, and apply an antiseptic foot poultice, such as bread, upon which a weak solution of Jeyes' fluid has been sprinkled. The recovery is usually soon with attention.

CONTAGIOUS FOOT-ROT.

The contagious form of foot-rot is quite different, and is far more serious, but it can be prevented, and is amenable to treatment. It is primarily due to the entrance of necrotic bacteria into soft structures of the foot. It spreads from sheep to sheep causing lameness, loss of flesh and even death. It first shows itself in a small, moist, unhealthy sag between the toes. This rapidly extends from above downwards, and may extend to two, three or even all four feet. The horn becomes broken, and the discharge attracts flies, eggs and larvae, which develop in the wound, or on the fleece which has come in contact with the discharge.

PREVENTION.

If noticed early, the disease should not get beyond control. Examine all fresh arrivals for lameness, isolate at once from the rest of the herd any animal showing the least sign of disease affecting the skin between toes. The shepherd should disinfect his hands, and also the sheepfold, and the manure and a few inches of surface soil should be removed and ploughed into the land, and the pastures given a rest until a winter's frost has sweetened it. A foot bath is more effectual than a dressing. Even the apparently healthy sheep every second day should be put through a shallow bath, and this is to be continued for a fortnight after the last case is detected.

TREATMENT.

After cleansing the affected foot, cut off all detached horn, so as to expose all the diseased tissue (trimmings burn or bury deeply). If much has to be cut away apply clean tow saturated with a weak antiseptic lotion, keep it in position with a properly adjusted bandage to keep out filth and wet. Later on a dry dressing of one part of chinosol, one part of burnt alum, and six parts of powdered Fuller's earth, applied once daily on cotton wool, and protected with suitable coverings, will quickly effect a cure.

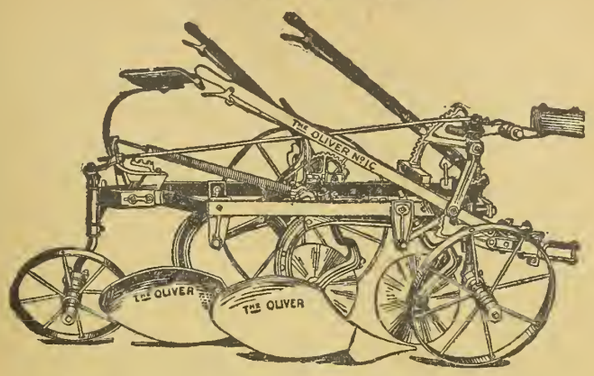
The directions for bath are as follows:—Make a bath of wood or concrete, 16 ft. long, 8 in. wide, sides sloping out, provided with cross pieces to prevent slipping, and side-fences boarded to admit sheep walking easily through.

The solution is made by dissolving 1 lb. of powdered sulphate of copper to each gallon of water. Although somewhat slow of solution, stirring and using warm water in the first instance will hasten it (for prevention half this strength will saffice). Pare the hoofs first, when necessary, so that the solution can come in direct contact with all the parts.

PRECAUTION.

Choose a day when grass and soil are dry. Remember the bath is poisonous, and take care the stock cannot get access to it. If ewes are treated, put them through the bath quietly, so that the teats are not splashed or wetted, as this is likely to make lambs ill. Do not hurry sheep through the bath. The object is only to wet the feet. If the wool becomes damped with the solution it may discolour it. This bath repeated at frequent intervals will effect a cure. The sheep should remain in the bath for about five minutes.—Southern Vet.

Oliver Plows



OLIVER Plows for Eastern Canada stand in a class by themselves as satisfaction givers.
The Oliver plow line includes walking plows, three-wheel sulkies, walking gangs, hill-side plows, high and low lift gangs, and riding cultivators. There are plows in the line which are specially adapted for most Eastern Canadian conditions. Among these are the Oliver 1-C sulky and 1-C gang. In both these plows most of the weight of the plow is carried on the two furrow wheels which, of course, ride on a smooth surface all the time. There is a spring on the land wheel which, in connection with the two bails on which the plow is hung, insures an even depth of plowing.
You can see any plow in the Oliver line at the place of business of the I H C local agent. If you will tell him what kind of plowing you want to do, he can show you an Oliver plow that will do your work best. See him for catalogues and full information, or write the nearest branch house.

THE HORSE.

Harness Galls and Sores.

Harness galls and sores are likely to occur on various parts of the horse's body, including the shoulders and neck, where they are caused by the pressure of the collar, and on the back or withers underneath the harness-pad, and on the brisket just behind the elbow, owing to the tender skin at this part getting chafed by the girth or belly-band; and, occasionally, on the sides, where these are touched by the traces, but their occurrence in this last position is comparatively rare. Shoulder galls are by far the most common kind, and usually, also, the most objectionable.

A BADLY FITTING COLLAR.

They are principally the result of a badly fitting collar; hence it is always important to see that the collar fits a horse in a proper manner. When the same set of harness is used for different horses in a stable, as sometimes happens, there should, at any rate, be provided a separate collar for each horse, for although the rest of the harness may fit them well enough, or can be readily adjusted to suit their respective size or shape, the same collar is hardly likely to fit them satisfactorily, while any adjustment of it is, of course, impossible. An unduly large collar is particularly liable to wring the shoulders, on account of its fitting so loosely that, instead of lying firmly in position, as a well-fitting collar does, it tends continually to shift about on them, which may easily result in the skin being rubbed sore. Galling is less likely to be caused by a collar that is to small, although this frequently gives rise to the trouble, while there is the special objection that it is apt to have a choking effect on the horse and impar its working powers. Apart, however, from badly fitting collars, there are other causes which are often responsible for sore shoulders, and the evil occurs in plenty of cases, even when the collar is a perfect fit.

DEFECTIVE COLLAR LINING.

Thus it sometimes results in consequence of the leather collar lining having got very hard, and perhaps even ridged. But this is very easily guarded against by periodically well oiling the inside of the collar, so as to keep the leather lining soft and pliable. Neatsfoot oil is the most suitable for the purpose. This precaution should be observed as a matter of course in every stable. In the case of collars lined with serge, most ly used for lining carthorse collars, the fact of the lining still being wet with sweat absorbed on the previous day may induce sore shoulders. For this reason it is incumbent to hang such collars in an airy place, so that they may dry properly, while it is desirable from time to time to put them out to air in the sun or wind and afterwards to beat and brush the lining well in order to remove the scurf and dried sweat adhering to it, and so to keep it soft and clean. As soon as the serge lining becomes defective, the collar should be re-lined.

TO RELIEVE FROM PRESSURE.

When a horse's shoulder is rubbed sore the galled place may be relieved from pressure by attaching a pair of pads to the collar, one pad being fastened to it just above the sore, and the other just below it. This will serve to keep the collar of the wound. Pads especially made for this purpose, and which strap into the collar, can be obtained from a harness-maker, but they are often improvisioned at home, and tied on with tapes. One must be careful however, to see that no galls arise under the pads, as is rather liable to happen if they are used for any length of time, because of the extra pressure which they cause. A rough-and-ready expedient sometimes adopted is to cut into and hollow out a suitably sized hole in the stuffing where it would press upon the injured place. This plan answers well enough as a temporary measure in slight cases. Very often a breast collar—also sometimes referred to as a Dutch collar—will come in usefully when a horse is suffering from sore shoulders, for it may leave the galled part or parts entirely untouched, in which the animal can temporarily worked in it without experiencing any inconvenience until the galls are healed. There are some horses which are afflicted with an inherent or special susceptibility to have their shoulders wrung by the collar, and which, in consequence, are constantly giving trouble on this account. In a case of this kind, recourse may be had to a false collar, made of leather or thin felt, which is worn underneath the collar. This expedient will often prevent any trouble. Another plan that may be

A GREAT SCANDAL

Big Efforts to Hush the Matter Up--- The Truth Out At Last . . .

Erom exhaustive enquiries made during the last few months we find there have been a number of patients kept under conditions which to say the least of it, is a great scandal.

We trust our readers will bear with us for a moment. The facts of the matter are these, there have been some thousands of cases where horses have been suffering from distemper, coughs, colds, kidney troubles, contracted hoof, swellings, splints and enlargements of all kinds, and in some cases no attempt has been made to relieve their sufferings, their owners either being indifferent, or where they have thought at all about their animals have had recourse to cheap so-called remedies, of which there are unfortunately a few on the market, but which, while some may give a little relief temporarily, cannot from the nature of their ingredients give permanent relief or effect a cure.

It is high time in our opinion that something should be done to bring this state of things to an end, and with this in view we are about to take drastic action, to bring before every owner of horses that wonderful remedy known to all as "Dr. J. Woodbury's Horse Liniment,"

This remedy has been used for years throughout the Dominion during which time it has been used in hundreds of cases, comprising distemper, coughs, colds, kidney troubles, contracted hoof, swellings, splints and enlargements of all kinds, and in no case to our knowledge, has "Dr. J. Woodbury's Liniment" failed to first relieve and then to cure the above mentioned complaints.

Every owner of horses should, if they have not already got a bottle of this Liniment in their stable immediately procure one. It is the only guaranteed remedy we know of, and it is a cheap form of insurance, and it will be found, that, if used immediately any symptoms of any of the above diseases appear, to give immediate relief, and probably save tremendous expense, probably the life of the horse as well.

Dr. J. Woodbury's Horse Liniment is sold by Stores and Chemists throughout Canada, but should your Storekeeper be out of stock he will procure it for you, and if you should find any trouble in getting a bottle, don't delay for an instant in mailing 25 cents and a bottle will be immediately forwarded you.

tried is to use a zinc-lined or galvanised iron collar, which sometimes suits tender-shouldered horses very well; while in the last resort a remedy may possibly be found by substituting a breast collar for the ordinary pattern. When there is a special tendency for the neck or withers to be chafed by the collar, a zinc-collar pad, which is fastened on the inside of the collar at the top, will in a certain proportion of cases prove a successful remedy.

OVER-TIGHT GIRTHS.

The main cause of sores on the back underneath the harness-pad consists in the latter being girthed up to tightly, so that it exerted an undue degree of pressure. This particular trouble is thus, as a rule, entirely avoidable with care. There is no need to tighten up the girth-band in an excessive manner, and a moderately firm adjustment of the pad is all that is required, for it does not readily shift or slip. If, however, as sometimes is the case, a horse should show a special liability to become galled at this part in spite of the harness-pad being comparatively loosely adjusted, it will be advisable to let the animal wear a thin leather or felt pad underneath it. Galls on the brisket frequently tend to be extremly troublesime, in some cases being even more so than bad collar galls. Some horses possess a constitutional tendency to suffer from them. The remedy for this trouble is to keep the girth and belly-band off the part that is chafed, or liable to become so, by strapping them back by means of a specially made narrow strap. This is provided with a loop at one end, through which the girth and belly-band are slipped, while the other end buckles into the breeching stop on the shaft. Very often a piece of twine is used as a makeshift for this purpose, and this may do as a temporary expedient, though it is apt to break, even when pretty strong, as a result of the strain upon it, and as the fact of this having happened cannot be observed by the driver while seated in the vehicle, it may easily happen in these circumstances that at on returning to the stable the old sore is found to have been badly chafed again by the girth-band, while all the time the driver may have believed that the latter was being held clear of it by the sting. If the skin is chafed at any part by a trace, several thicknesses of flannel or soft wash-leather should be smoothly wrapped round and securely sewn on to the trace at the place where it chafes.

YOUNG HORSES IN HARNESS.

When they are first put into harness, young horses are particularly liable to be galled by the harness, because their skin is not accustomed to the pressure and friction caused by the collar, pad, etc. Horses just up from the grass are also specially susceptible to suffer from this trouble because of their soft condition. The fact of a horse's system being in a heated state, or "humoury," in another predisposing cause of harness galls and sores, while some horses are usually prone to them, owing to their skin being specially sensitive and delicate. In all these cases it is a useful plan, in order to harden the skin, to bathe the parts exposed to galling twice or thrice a day with a saturated solution of alum, while a lotion consisting of bluestone (copper sulphate), dissolved in water (at the rate of 5 grains to an ounce of water), may also be recommended for use as a toughening agent and to counteract any tendency on the part of the skin to become chafed. Two simple remedies for abrasions and sores caused by the harness are oxide of zinc ointment and Goulard's extract, the latter making a very good wash.—Argus.

FREE-FARM ACCOUNT BOOK

Bickmore's Farm Account Book will be sent free to any farmer who will tell us who and where he is. This book is arranged to keep all accounts in simple form—more simple and certainly more practical than trying to remember them; shows what to charge against crop production; has a laborers' time record; and section for personal accounts. **64 pages, for ink or pencil.** Not a cheap affair. Its quality is in keeping with **BICKMORE'S** Gall Cure, a soothing, healing salve, the old-time reliable horse remedy. Horses are now too valuable and too high priced to take chances of losing their services. **Bickmore's** Gall Cure heals and cures **Harness and Saddle Galls; Rope Burn, Cuts, Scratches, Grease Heel,** etc. You don't have to lay the horse off. **Bickmore's cures while the horse works.** Great thing for sore teats in cows. The work-horse trade mark on every box. None genuine without it. Be sure to ask for **Bickmore's** Gall Cure when you go to buy and do not take a substitute. Farm Account Book is ready. Send today.

RED ROSE TEA "Is good Tea"

An Income For the Farmer's Wife

THE wife of every farmer should have her own income and her own bank account.

And it does not matter how busy you are in the home, or how little time you have to devote to the raising of poultry we can show you how you can make a good income and build up a substantial bank account by poultry raising the Peerless Way.

We can show you how to be independent of the money your husband gets for his crops and other farm produce, so that when you wish to buy clothes, or take a shopping trip to town, you can just stop at the bank and draw all the money you will require.

The Peerless Way Makes Poultry Pay

If you know the right way to raise and keep poultry it requires very little outlay or money, and takes but very little of your time. The right way is the Peerless Way, that is, by hatching the eggs in a Peerless Incubator and rearing chickens in a Peerless Brooder.

Send for Booklet

We have prepared a book for you entitled "Money In Eggs," if you would be interested in learning how other women like you are making independent incomes from the sale of eggs and plump chickens. Experience is not essential. We are practical poultry raisers ourselves and will furnish you all the information necessary to make your chickens pay you handsome profits.

Fill in and send this coupon now for full particulars.

That Persistent, Hacking Cough

is not only wearing, disagreeable and dangerous — it is unnecessary, too, for you can quickly stop it by taking

NA-DRU-CO

Syrup of Linseed, Licorice and Chlorodyne

This remarkable combination of these three standard cough and cold remedies loosens the phlegm, promotes expectoration, relieves that exasperating tickling in the throat, and the cough disappears.

Of course it is better still to take Na-Dru-Co Syrup of Linseed, Licorice and Chlorodyne when you first feel the cold coming on, and check it at once. Get a 25c. or 50c. bottle from your Druggist and keep it on hand, ready.

NATIONAL DRUG AND CHEMICAL CO. OF CANADA, LIMITED. 318

Concrete walks need no repairs

THEY are not only best at first but are cheaper in the end than any other kind of walk. They are clean, permanent and safe. There is nothing to become loose nor are they slippery. They improve the general appearance of a house and are a source of great satisfaction to every housewife because they keep children out of the mud, prevent colds from wet feet and prevent dirt from being "tracked in" on floors and carpets. Equally important is the fact that they never wear out and never need repairs.

This free book "What the Farmer can do with Concrete" tells all about concrete walks and how to build them, and a score of other things needed on every farm. Write for it to-day.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. adies, this department is yours. Use it to the best advantage.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

On these occasions Mr. Dick never travelled without a leathern writing-desk, containing a supply of stationary and the Memorial; in relation to which document he had a notion that time was beginning to press now, and that it really must be got out of hand.

Mr. Dick was very partial to ginger bread. To render his visits the more agreeable, my aunt had instructed me to open a credit at a cake-shop, which was hampered with the stipulation that he should not be served with more than one shilling's-worth in the course of any one day. This, and the reference of all his little bills at the county inn, where he slept, to my aunt, before they were paid, induced me to suspect that he was only allowed to rattle his money, and not to spend it. I found on further investigation that it was so, or at least there was an agreement between him and my aunt that he should account to her for all his disbursements. As he had no idea of deceiving her, and always desired to please her, he was thus made chary of launching into expense. On this point, as well as on all other possible points, Mr. Dick was convinced that my aunt was the wisest and most wonderful of women; as he repeatedly told me with infinite secrecy and always in a whisper.

"Trotwood," said Mr. Dick, with an air of mystery, after imparting this confidence to me, one Wednesday; "who's the man that hides near our house and frightens her?"

"Frightens my aunt, sir?"

Mr. Dick nodded. "I thought nothing would have frightened her," he said, "for she's—"here he whispered softly, "don't mention it—the wisest and most wonderful of women." Having said which he drew back, to observe the effect which this description of her made upon me.

"The first time he came," said Mr. Dick, "was—let me see—sixteen hundred and forty-nine was the date of King Charles execution, I think you said sixteen hundred and forty-nine?"

"Yes, sir."

"I don't know how it can be," said Mr. Dick, sorely puzzled and shaking his head. "I don't think I am as old as that."

"Was it in that year that the man appeared, sir?" I asked.

"Why, really," said Mr. Dick, "I don't see how it can have been in that year, Trotwood. Did you get that date out of history?"

"Yes, sir."

"I suppose history never lies, does it?" said Mr. Dick, with a gleam of hope.

"Oh dear, no, sir" I replied, most decisively. I was ingenious and young, and I thought so.

"I can't make it out," said Mr. Dick, shaking his head. "There's something wrong, somewhere. However, it was very soon after the mistake was made of putting some of the trouble out of King Charles's head into my head, that the man first came. I was walking out with Miss Trotwood after tea, just at dark, and there he was, close to our house."

"Walking about?" I inquired.

"Walking about?" repeated Mr. Dick. "Let me see. I must recollect a bit. N—no, no; he was walking about."

I asked, as the shortest way to get at it, what he was doing.

"Well, he wasn't there at all." said Mr. Dick, "until he came up behind her, and whispered. Then she turned round and fainted, and I stood still and looked at him, and he walked away; but that he should have been hiding ever since (in the ground or somewhere), is the most extraordinary thing!"

"Has he been hiding ever since?" I asked.

"To be sure he has," retorted Mr. Dick, nodding his head gravely. "Never came out, till last night. We were walking last night, and he came up behind her again, and I knew him again."

"And did he frighten my aunt again?"

"All of a shiver," said Mr. Dick, counterfeiting that affection and making his teeth chatter. "Held by the pailings, Cried. But Trotwood, come here," getting me close to him, that he might whisper very softly; "why did she give him money, boy, in the moonlight?"

"He was a beggar, perhaps."

Mr. Dick shook his head, as utterly renouncing the suggestion; and having replied a great many times, and with great confidence, "No beggar, no beggar, no beggar, sir!" went on to say, that from his window he had afterwards, and late at night, seen my aunt give the person money outside the garden rails in the moonlight, who then slunk away—into the ground again, as he thought probable—and was seen no more; while my aunt came hurriedly and secretly back into the house, and had, even in the morning, been quite different from her usual self; which preyed on Mr. Dick's mind.

I had not the least belief, in the outset of this story, that the unknown was anything but a delusion of Mr. Dick's, and one of the line of that ill-fated Prince who occasioned him so much difficulty; but after some reflection I began to entertain the question whether any attempt, or threat of an attempt, might have been twice made to take poor Mr. Dick himself from under my aunt's protection, and whether my aunt, the strength of whose kind feeling towards him I knew from herself, might have been induced to pay a price for his peace and quiet. As I was already much attached to Mr. Dick, and very solicitous for his welfare, my fears favored this supposition; and for a long time his Wednesday hardly ever came round, without my entertaining a misgiving that he would not be on the coach-box as usual. There he always appeared, however, grey-haired, laughing, and happy; and he never had anything more to tell of the man who could frighten my aunt. ...

...These Wednesdays were the happiest days of Mr. Dick's life; they were far from being the least happy of mine. He soon became known to every boy in the school; and though he never took an active part in any game but kite-flying, was as deeply interested in all our sports as any one among us. How often have I seen him, intent upon a match at marbles or peg-top, looking on with a face of unutterable interest, and hardly breathing at the critical times! How olten, at hare and hounds, have I seen him mounted on a little knoll, cheering the whole field on to action, and waving his hat above his grey head, oblivious of King Charles the Martyr's head, and all belonging to it! How many a summer hour have I known to be but blissful minutes to him in the cricket-field! How many winter days have I seen him, standing blue-nosed, in the snow and east winds, looking at the boys going down the long slide, and clapping his worsted gloves in rapture!

He was a universal favorite, and his ingenuity in little things was transcendent. He could cut oranges into such devices as none of us had an idea of. He could make a boat out of anything, from a svewer upwards. He could turn crampbones into chessmen; fashion Roman chariots from old court cards; make spoked wheels aut of cotton reels, and birdcages of old wire. But he was greatest of all, perhaps, in the articles of string and straw; with which we were all persuaded he could do anything that could be done by hands.

Mr. Dick's renown was not long confined to us. After a few Wednesdays, Doctor Strong himself made some inquiries of me about him, and I told him all my aunt had told me; which interested the Doctor so much that he requested, on the occasion of his next visit, to be presented to him. This ceremony I performed; and the Doctor begging Mr. Dick, whenever he should not find me at the coach office, to come on there, and rest himself until our mornings work was over, it soon passed into a custom for Mr. Dick to come on a matter-of course, and, if we were a little late, as often happened on a Wednesday, to walk about the courtyard, waiting for me. Here he made the acquaintance of the Dactor's beautiful young wife (paler than formerly, all the time; more rarely seen by me or anyone, I think; and not so gay, but not less beautiful), and so became more and more familiar by degrees, until, at last, he would come into the school and wait. He always sat in a particular corner, on a particular stool, which was called "Dick," after him; here he would sit, with his grey head bent forward, attentively listening to whatever might be going on, with profound veneration for the learning he had never been able to acquire.

This veneration Mr. Dick extended to the Doctor, whom he thought the most subtle and accomplished philosopher of any age. It was long before Mr. Dick ever spoke to him otherwise than bareheaded; and even when he and the Doctor had struck up quite a friendship, and would walk together by the hour, on that side of the courtyard which was known among us as the Doctor's walk, Mr. Dick would pull off his hat at intervals to show his respect for wisdom and knowledge. How it ever came about, that the Doctor ever began to read out scraps of the famous Dictionary, in these walks, I never knew; perhaps he felt it all the same at first, as reading to himself. However, it passed into a custom too; and Mr. Dick, listening with a face shining with pride and pleasure, in his hearts of hearts believed the Dictionary to be the most delightful book in the world.

As I think of them going up and down before those school-room windows—the Doctor reading with his complacent smile, an occasional flourisn of the manuscript, or grave motion of the head; and Mr. Dick listening, enchanted by interest, with his poor wits calmly wandering, God knows where, upon the wings of hard words—I think it as one of the pleasantest things, in a quiet way, that I have ever seen. I feel as if they might go walking to and fro forever, and the world might somehow be the better for it. As if a thousand things it makes a noise about, were not one half so good for it or me.

Agnes was one of Mr. Dick's friends very soon; and in often coming to the house, he made friends with Uriah. The friendship between himself and me increased continually, and it was maintained on this odd footing: that, while Mr. Dick came professedly to look after me as my guardian, he always consulted me in any little matter of doubt that arose, and invariably guided himself by my ad-

Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

BLUE AND DISCOURAGED

Mrs. Hamilton Tells How She Finally Found Health in Lydia E. Pinkham's Vegetable Compound.

Warren. Ind.—"I was bothered terribly with female weakness. I had pains and was not regular, my head ached all the time, I had bearing down pains and my back hurt me the biggest part of the time, I was dizzy and had weak feelings when I would stoop over, it hurt me to walk any distance and I felt blue and discouraged.

"I began taking Lydia E. Pinkham's Vegetable Compound and am now in good health. If it had not been for that medicine I would have been in my grave a long time ago."—Mrs. ARTIE E. HAMILTON, R. F. D. No. 6. Warren, Ind.

Another Case.

Esmond, R. I.—"I write to tell you how much good your medicine has done me and to let other women know that there is help for them. I suffered with bearing down pains, headache, was irregular and felt blue and depressed all the time. I took Lydia E. Pinkham's Vegetable Compound and commenced to gain in a short time and I am a well woman today. I am on my feet from early morning until late at night running a boarding house and do all my own work. I hope that many suffering women will try your medicine. It makes happier wives and mothers."—Mrs. ANNA HANSEN, Esmond, Rhode Island.

CHALLENGE COLLARS

Are a boon to every man who cares for his personal appearance.

Challenge Collars are not shiny rubber collars. They have a dull linen finish. In fact, you can't tell them from linen. Keep up appearances—keep down laundry bills.

Sold at all Gents' Furnishing and Dry Goods Shops, or send 15c. for sample collar.

vice; not only having a high respect for my native sagacity, but considering that I inherited a good deal from my aunt.

One Thursday morning, when I was about to walk with Mr. Dick from the hotel to the coach-office before going back to school (for we had an hour's school before breakfast), I met Uriah in the street, who reminded me of the promise I had made to take tea with himself and his mother: adding, with a writhe, "But I didn't expect you to keep it, Master Copperfield, we're so humble."

I really had not been able to make up my mind whether I liked Uriah or detested him; and I was very doubtful about it still, as I stood looking him in the face in the street. But I felt it quite an affront to be supposed proud, and said I only wanted to be asked.

"Oh, if that's all, Master Copperfield," said Uriah, "and it really isn't our humbleness that prevents you, will you come this evening? But if it is our humbleness, I hope you won't mind owning to it, Master Copperfield; for we are all well aware of our condition."

I said I would mention it to Mr. Wickfield, and if he approved, as I had no doubt he would, I would come with pleasure. So, at six o'clock that evening, which was one of the early office evenings, I announced myself as ready, to Uriah.

"Mother will be proud, indeed," he said, as we walked away together. "Or she would be proud, if it wasn't sinful, Master Copperfield."

"Yet you don't mind supposing I was proud this morning," I returned.

"Oh dear, no, Master Copperfield!" returned Uriah. "Oh, believe me, no! Such a thing never came into my head! I shouldn't have deemed it at all proud if you had thought us too humble for you. Because we are so very umble."

"Have you been studying much law lately?" I asked, to change the subject.

"Oh, Master Copperfield," he said, with an air of self-denial, "my reading is hardly to be called study. I have passed an hour or two in the evening, sometimes, with Mr. Todd."

"Rather hard, I suppose?" said I.

"He is hard to me, sometimes," returned Uriah. "But I don't know what he might be, to a gifted person."

After beating a little tune on his chin as he walked on, with the two forefingers of his skeleton right hand, he added:

"There are expressions, you see, Master Copperfield—Latin words and terms—in Mr. Todd, that are trying to a reader of my humble attainments."

"Would you like to be taught Latin!" I said, briskly. "I will teach it to you with pleasure, as I learn it."

"Oh, thank you, Master Copperfield," he answered, shaking his head. "I am sure it's very kind of you to make the offer, but I am much too umble to accept it."

"What nonsense, Uriah!" ...

(Continued in next issue)

How to Guard Against Measles and Scarlet Fever.

The greatest preventative force against any disease is the normal, healthy conditions of the person exposed to the infection of that disease. A person's power or degree of resistance is his best safeguard. A lowering the normal vitality, from whatsoever cause, tends toward the rapid multiplication of disease germs lodged in the body. Normal, vital resistance is the first great guard.

To keep that resistance at its best one must live normally—no excess in working, playing, eating or drinking. Sleep eight hours, work eight hours, recreate the body and mind eight hours. Eat plain nutritious food. Drink no stimulants but much pure water each day. Dress comfortably both as to weight of clothing and fit of each article worn. All clothing from head to foot should be loose. Anything worn tight constricts circulation, impinges nerves and lowers vitality. Exercise systematically as to kind, degree, duration, time of day and always with vigor and a cheerful mind. Muscles and vital force are built up by exercise. Eliminate the fret and worry of life. Worry and fear reduce the resistance more than any other cause. Sleep in a well ventilated room or out of doors. Get in the sunshine as much

YOUR FLOUR AND YEAST MAY BE THE BEST —AND THE COOK MAY BE AN EXPERT—

but if you have a poor stove, your bread is doomed. So with cakes, pastry and meats—a good baking stove is an absolute necessity.

Write your answer on a Post Card or letter, giving name and address plainly.

DOMINION WATCH COMPANY, Dept. 86 MONTREAL, CANADA

as possible each day. The sun's rays destroy many germs. The care of the skin is very important. The sweat glands are sewers pouring the refuse from worn out tissues out on the surface of the body. Any habit of life which tends to clog the mouths of these sweat glands will keep the poisons inside to reduce the vitality. Frequent cleansing of the skin is a necessity of life. No article of clothing containing wool should be worn next to the skin at any time. Wool is non-absorbant, and prevents the evaporation of the sweat and greatly reduce the activity of the sweat glands. Wool cannot be sterilized and brings live germs in direct contact with the skin.

But Measles and Scarlet Fever are very largely diseases of childhood. It becomes the duty of the parents to see that these directions for preserving and building up the resistance of their children are enforced. A normal healthy child rarely "catches" disease.

But should a child or older person become ill with either measles or Scarlet Fever he should be completed isolated from all others save the nurse or attendant. The parents of a sick child should, as an act of neighborly kindness, keep the child away from healthy children. The infection from both of these diseases lies largely in the skin. The infested skin peels off or scales off and is carried in may ways to others. In Scarlet Fever the discharge from the throat and nose are also highly contagious. A few ways of preventing this spreading of the germs of these diseases may be mentioned. The sick child should be isolated in an upper room removed from the other occupants of the house. Only one attendant and the physician should be allowed to enter the room. A sheet moistened with a 1 to 2000 solution of Bichloride of Mercury (Corrosive Sublimate) should be hung over the doorway. The room should be free from all unnecessary articles. All clothing and bedclothing should be disinfected before leaving the room. Food remaining from a meal should be covered with disinfectant and burned. Utensils of all kinds should be boiled in the room before being removed. A simple expedient for the prevention of the spread of these diseases is the annointing of the entire skin surface of the patient with Cocoa Butter and wiping the surface with a soft cloth and then literally "burn the rag."

After the recovery of the patient the room should be fumigated with formalin gas and thoroughly cleaned, and each and every article in it disinfected.

Absolute disinfection and cleanliness are the key words to the prevention of the spread of these diseases.—C. S. Putman, M. D., N. Dak. College.

Home Hints.

There is seldom little space to spare in cottage homes, and therefore every little recess should be taken advantage of, either by fixing up shelves or by constructing a cupboard that will hold things that are only wanted occasionally. In this way bulky articles are not essential, and much valuable space in the middle of a room is saved. Occasionally the underneath of a stairway is cased round with match boarding, which, if removed, opens up a valuable corner that could be given up to shelving. If the floor thus opened up be rough a spare piece of linoleum should be tacked down. A recess between the fire-place and wall in a bedroom could be fitted up as a clothes chest. Fix up a couple of boards to form the uprights, to which the shelves can be nailed, or, better still, grooves, so that each shelf is easily taken out and kept clean. The top board will answer for holding a swing looking-glass and many little ornaments and trinkets dear to the cottager. Finish off neatly by fastening up a rod to hold a few curtain rings; curtains of pretty cretoone will finish the clotes store tidily.

In old cottages the large beams can be made excellent use of. A couple of iron brackets screwed up will hold a handy, respectable shelf for holding odds and ends. Or screw hooks fastened in will hold many utensils that usually take up cupboard room. Children are fond of a small stool. This can often be found a pleasant place for a cosy corner. In the scullery, if there is a beam, it is extremely handy for hanging things on, or a shelf may be fitted up there for holding boot brushes and like things.

Never wring out the water from blankets by twisting them. Fold them neatly before passing them between the rollers of a machine, but never with much pressure — just enough to squeeze out the water. Use a clean sheet to enfold the blanket, so that they don't catch in the some times rough rollers.

After cleaning a chopping or mincing machine and its disc knives in strong soda soapy water, dip them in boiling water, quickly drying them with a cloth. Then place them on a hot plate, or inside the oven. There is then no danger of rusting, which, however, is generally caused by keeping it in a damp place.

To clean a smoked-blacked ceiling, make a fairly thick paste of starch and water, and apply this with a pad of flannel. When dry, brush off with a soft brush, and you will find the result well worth the trouble.

White paper should not be used for wrapping articles that are to be stored away, for the chloride of lime, in it will destroy the color of the fabric. Yellow or blue paper answers the purpose far better.

How to Keep Sausage.

My way of preserving sausage for summer use is exceedingly easy, yet seems to be unknown to many people.

I keep on hand a quantity of inexpensive enamel basins of sizes holding from one to three quarts. As we mix our sausages at buchering time I pack it at once in these basins, which are placed in a moderately hot oven and allowed to bake until the fat draws out and meat browns a little on top—usually from 15 to 25 minutes, according to size of basin. It is then removed and a weight placed on the meat so that the melted fat rises over it; I like to place an inverted plate under the weight and leave it covered with the fat when it becomes cold.

With a paper tied over the top these basins are set in a cool, dry place. When the meat is cut it looks and taste like fresh sausage, having been cooked just enough to cover it securely with the fat. It browns in the frying-pan, making the browned gravy the men think indispensable with sausage. We usually eat the last of it in August when it is still in good condition. The object of using such smali receptacles is that but a small quantity need be cut at once, since it does not keep long after being exposed to the air in hot weather.

"Dont" for Mothers.

Don't say, "Oh, do be quiet," or "Do be still!" Remember that bones and muscles must develop. Make a place for them to do so. This is your duty.

Don't permit a fear to be implanted in your child.

Don't forget that "What?" and "Why?" are the best manifestations of a normal brain. Take time and pains to make it grow wisely.

Don't take your small child shopping.

Don't fail to give the reason why every time you give a command. You want the obedience of an intelligent, reasonable being, not that of an automaton.

Don't forget that the mother who can enter into all her children's pleasures has discovered a marvellous "youth restorer."

Don't bring up your children upon a steady diet of "Dont's," miserable prickly little word that it is, and sure to rub the wrong way.

In which you can have perfect confidence. You can always be proud of the results of your baking if you use

REGAL FLOUR

because with Regal, you have the right foundation for perfect bread and pastry—a better product because made of better material.

YOU CAN PROVE THIS

without risk by buying a barrel of "Regal" with the understanding that you will get you money back if the flour is unsatisfactory.

LET ME CURE YOU OF RHEUMATISM FREE

Mr. Delano took his own medicine. It cured his rheumatism after he had suffered tortures for thirty six years. He spent thousands of dollars before he discovered the remedy that cured him, but I will give you the benefit of his experience for nothing

If you suffer from rheumatism let me send you a package of this remedy absolutely free. Don't send any money. I want to give it to you. I want you to see for yourself what it will do. The picure shows how rheumatism twists and distorts the bones. Maybe you are suffering the same way. Don't. You don't need to. I have the remedy that I believe will cure you and it's yours for the asking. Write me today. F. H. Delano, 531-C Delano Bldg., Syracuse, New York, and I wil send you a free package the very day I get your letter.

Don't offer bribes as an inducement to good behaviour.

Don't forget that "almost fourteen' are crucial years in the lives of your son and daughter.

Uses for Stale Bread.

In almost every home there occurs every once in a while an accumulation of stale bread that the housewife does not want to throw away and yet finds it puzzling to prepare in ways that are palatable. Here are two good routes over which to send your stale bread:

Tomato Patties—Moisten one quart of stale bread crumbs with stewed tomatoes, enough to make them mouldable; one cup of grated cheese, one egg and a piece of butter the size of an egg salt and pepper. Mould into patties, roll in crumbs and fry in butter or lard. Serve hot garnished with parsley.

Breaded Eggs in Ramkins — Place a small piece of butter in the bottom of the dish, over this a layer of the bread crumbs. Break in a fresh egg, season with salt and pepper; over this another layer of bread crumbs, with a generous layer of grated cheese, and lots of butter for the last layer. Bake about ten minutes. Serve hot from the ramkins.

A Carpenter's Hint.

A carpenter who came to the house to labor with some recalcitrant window sashes showed us a hole hollowed out in the end of his hammer handle. In this he kept a supply of soap which he recommended as useful for a variety of household purposes, such as freasing windows sashes which refused to move up or down, drawers which would not open, gas joints which leak the meres trifle, the end of a door catch which sticks in closing, and, last of all, the end of a nail which must be driven straight into a piece of hardwood, a difficult trick, as every person who has tried it is aware.

French Doll FREE

to the little girl selling 30 sets of our Birthday, Floral, Scenic, Comic, (Christmas, Valentine, Easter, Thanksgiving in season), Postal Cards, (6 in set for 10c.) the doll has sleeping eyes, long flowing curls, jointed limbs, very daintily dressed. Send your name and address today plainly written, we will send cards free. Return us money when sold and we will mail doll post paid. Get big catalogue of free premiums for boys and girls.

Bank of N. S. Annual Statement.

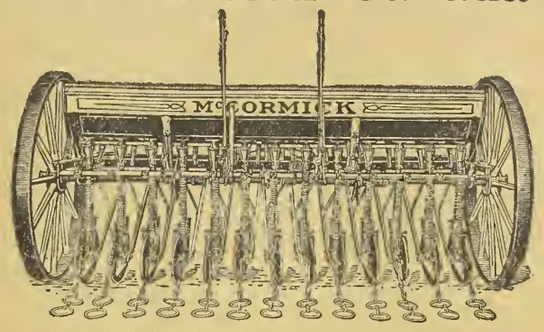
The bank of Nova Scotai's eighty-second Annual Statement appears in this issue. Owing to changes in the form of statement made necessary by the recent revision of the Bank Act, comparisons with last year's figures cannot readily be made. However, it may be noted that the total assets have increased from $71,279,298.95 to $80,151,829.99 during the year. Liabilities to the public (deposits, notes outstanding, etc.) total $62,686,436.27. The holdings of coin and legal tender amount to $10,440,849.08. Notes of and cheques on other banks, balances due by banks and banking correspondents, including Sterling Exckange, amount to $7,885,463.07, and other readily available assets such as call loans and investments are held to the extent of $20,746,796.20. So it can be seen that against the Bank's total liabilities to the public it holds in cash 16 per cent in immediately availables 29 per cent, and in quick assets 62 per cent. This is a very strong showing and should be viewed with satisfaction by the shareholders and Depositors.

Net profits for the year, after losses by Bad Debts are estimated and provided for, amount to $1,210,774.39, as compared with $970,544.38 a year ago. These profits are distributed in the payments of dividends at the rate of 14 per cent, amounting to $814,504.60, contribution to the Officers Pension Fund $50,000, written off Bank Premises $150,000. Premium paid Bank of New Brunswick on purchase $100,000. and transferred to the Reserve Fund $110,000. leaving a balance of $41,124.27 to carry forward.

The paid-up Capital has been increased by an issue of new stock and by the Capital Stock of the Bank of New Brunswick, from $4,734,390. to $6,000,000. The Reserve Fund, with the addition of the Reserve of the Bank of New Brunswick $1,790,000. Premium received on new stock $317,854. and an appropriation from Profit and Loss of $110,000. is brought to an even $11,000,000.

The Shareholders of this sound old institution must be pleased indeed to note that that their bank has so well maintained its position during the year 1913.

McCormick Drills For Eastern Canada



A McCORMICK drill prepares the best possible seed bed, and McCormick drills are longest-wearing. Any man who owns one of these implements will assure you that these are facts. When you buy a drill, buy a McCormick.

McCormick single disk and hoe drills have continuous axles, strong, light, thoroughly braced frames of angle steel, and durable, wide running drive wheels. They have a double run force feed which adapts them perfectly to the sowing of all kinds of seed.

Bearings are simple, as nearly as possible dust-proof, and easily oiled. Grain boxes are of large capacity, and they are too firmly supported to allow sagging.

See McCormick drills at the nearest I H C local agent's. All their features are explained in our catalogues. Get catalogues from the dealer, or drop a line to the nearest branch house.

Was Badly Run Down.

Milburn's Heart and Nerve Pills Built Her Up.

Mrs. Frank Blough, Sarnia, Ont., writes:—"I embrace the opportunity to write you saying that I have used Milburn's Heart and Nerve Pills, and found them very helpful to me. I was very badly run down, and was taking doctor's medicine. My son, out West, wrote me saying, 'Mother! you use the Milburn's Heart and Nerve Pills, they will be better for you than doctor's medicine.' This I did with good results. I often recommend them to other people. My doctor did not know I was using them, he used to say 'Why! I never saw any one's heart gain up like yours has. You do not need any more medicine.'"

Milburn's Heart and Nerve Pills are 50c. per box, 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

N. B. Fruit Growers in Annual Sussion

(Continued from page 291)

He expressed his pleasure in being able to welcome them, and said he was much pleased with the work of the association, and of Mr. Turney in particular, to whom great credit was due for the splendid exhibit of fruit at the exhibition last fall. He also paid a tribute to the late J. C. Gilman. "If the fruit growers of N. B. are all men like Mr. J. C. Gilman the success of the province is assured," said the mayor.

The chairman thanked Mayor Hooper for his kindly welcome and words of encouragement.

COMMITTEES APPOINTED.

A committee composed of Messrs S. L. Peters, S. B. Hatheway, W. B. Gilman and A. G. Turney was appointed to consider report on amended conditions under which apples are to be placed on the market.

The nomination committee was composed of Messrs. S. B. Hatheway, S. L. Peters, J. W. Clark and James Barnes.

DELEGATES TO DOMINION FRUIT CONFERENCE AT OTTAWA NEXT SUMMER.

Nominations for delegates to Dominion Fruit Conference at Ottawa were called for. Messrs. C. N. Vroom S. B. Hatheway and W. B. Gilman were elected by ballot.

Messrs Herbert Smith, J. W. Clark and H. Wilmot, were elected as substitutes in the order named.

MR. S. L. PETERS ON MARKETING FRUIT.

Mr. Peters spoke very highly of the conditions of this province as regards fruit growing. He said that the question of fruit growing had long ago been settled. It is now an established fact that apples can be grown in New Brunswick equally as well as in any other part of Canada. "We can grow," said Mr. Peters "just as good fruit as we care to work for." The pack is the important feature in regard to marketing fruit. Very often poor packages of fruit are put on the market which means a big decrease in the revenue for fruit, and a substantial loss to such a packer. Don't sacrifice quality for quantity.

Mr. Peters then explained some ammendments in the Fruit Marks Act. No prosecutions were made for violation this past year, but the Department at Ottawa intends to punish to the limit any one infringing on the rules. A copy of the Fruit Marks Act as ammended, will gladly be sent to anyone writing to the Fruit Division, Ottawa.

Mr. Peters warned the growers against overfacing, and cautioned them to be very careful in grading. "A well graded and well-packed No. 2 will sell for almost as much as No. 1. If we prune and spray well and grade and pack honestly, our success is assured."

SMALL FRUITS.

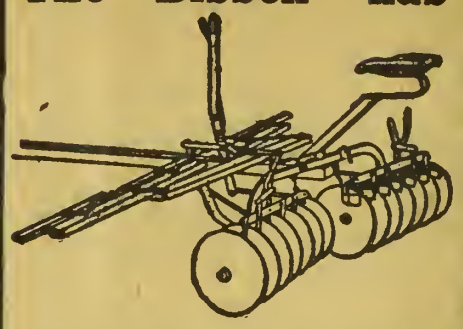
"Small fruits can be grown very profitably in New Brunswick. There is a good home market as well as a large market in Montreal, Boston and Halifax. One and a quarter million boxes of small fruits were produced in New Brunswick in 1912. The season of 1913 being poor, only 750,000 were produced.

As our berries are always later than those from other provinces and United States, there is always a ready market for them."

A discussion followed this address from which a great deal of information was derived. Mr. Hatheway thinks that apples which bring the highest prices can be grown here to perfection.

He suggested that the Department

The "Bissell" has the capacity



Because of its capacity, time after time the "Bissell" Disk Harrow has done DOUBLE THE WORK in field competition against all competitors, under the same conditions.

The special shape of the "Bissell" plates cause them to enter the ground naturally and TURN THE SOIL EASILY. Steel scraper blades meet the Disk Plates chisel fashion and keep the plates clean of trash by movable clod irons—the only Harrow that has this feature.

Anti-friction balls (40) are used in the bearings, on every "Bissell" Disk.

The seat is placed back on the Harrow so that the weight of the driver when riding balances over the frame and REMOVES NECK WEIGHT. The hitch is well back, MAKING LIGHT DRAUGHT.

Search the Continent over and you will not find a Harrow with such cutting capacity, easy draught and correct proportions as the "Bissell." A postcard to Dept. M will bring you a free catalogue.

Make Your Stock and Poultry Pay Better with Royal Purple

STOCK AND POULTRY SPECIFICS

At a cost of less than a cent a day per head of stock, it will increase their value 25 per cent. Permanently cures Colic, Debility, Worms, Bots and Skin Diseases. Tones up run-down animals so that they quickly gain weight and vigor. Increases the yield of milch cows three to five pounds a day, besides enriching the quality of the milk.

ROYAL PURPLE is not a food. It is a conditioner—the best ever so'd. If there was any better we would be making it. It enables your stock to eat the natural food they should eat and get the most benefit from it. Here is the advice of all thorough veterinary doctors—"Feed your stock on food of your own growing"—not pamper them with soft predigested mush so that after a time they cannot digest good, wholesome feed. Feed the good food grown on your own farm—hay, oats, bran, chop, etc. You know what these things cost you and what they will do.

ROYAL PURPLE is an aid to these natural foods and if you use it as directed, we can guarantee better results than if you feed any of the concoctions offered on the market as "prepared foods."

Try It On a Poor-Conditioned Animal

If there is a run-down, poorly nourished beast on your farm, see what **ROYAL PURPLE SPECIFIC** will do for it. A 50-cent package lasts a cow or horse 70 days. The cost is so trifling that no farmer in Canada has any excuse for having out-of-health stock around his place. Try it on the poorest-conditioned animal you have and we know you'll be surprised at the result of a short treatment. Cattle and hogs fatten up a month earlier than without it, which means you save a month's feed and a month's labor. You can bring six pigs to the pink of condition at the cost of $1.50. Steers treated in the same way cost no more than $1.00 each to put in prime state for market. **ROYAL PURPLE SPECIFIC** fattens and keeps well horses, mares, colts, cows, calves, steers, hogs. Sold in packages, 50c, and air-tight tins, $1.50.

Try ROYAL PURPLE POULTRY SPECIFIC on Your Hens

Do you know that **ROYAL PURPLE POULTRY SPECIFIC** makes hens lay in winter as well as in summer, and keeps them free from disease? It does, and helps them over the moult, fattens and keeps them in vigorous health. A 50c package lasts 25 hens over 70 days. Shouldn't you try it? We have hundreds of recommendations from all parts of the country. If **ROYAL PURPLE** does not give you better results than anything you ever used, or give you satisfaction, we will refund your money. No matter what your opinion of other preparations, we want you to give **ROYAL PURPLE POULTRY SPECIFIC** a chance to show what it can do for your poultry—and a 50c package will show you some fine results. Sold in 25c and 50c packages and $1.50 air-tight tins.

WE ALSO SELL

Royal Purple Cough Specific for cough and distemper. (Will cure any ordinary cough in four days). 50c, by mail 60c.

Royal Purple Sweat Liniment for lameness, rheumatism, sprained tendons, etc. 50c, by mail 60c.

200,000 Have Learned to Play the Piano In One Hour

Without Lessons or Knowledge of Music Anyone Can Play the Piano or Organ in One Hour.

Wonderful New System That Even a Child Can Use.

He—"You surprise me! You told me yesterday you couldn't play a note!"
She—"I couldn't; I learned to play in one hour by the wonderful 'Easy Method Music.'"

Impossible, you say? Let us prove it at our expense. We will teach you to play the piano or organ and will not ask one cent until you can play.

A musical genius from Chicago has invented a wonderful system whereby anyone can learn to play the Piano or Organ in one hour. With this new method you don't have to know one note from another, yet in an hour of practice you can be playing your favorite music with all the fingers of both hands and playing it well.

The invention is so simple that even a child can now master music without costly instruction. Anyone can have this new method on a free trial merely by asking. Simply write saying, "Send me the Easy Form Music Method as announced in The Maritime Farmer

FREE TRIAL

The complete system together with 100 pieces of music will then be sent to you Free, all charges prepaid and absolutely not one cent to pay. You keep it seven days to thoroughly prove it is all that is claimed for it, then if you are satisfied, send us $1.50 and one dollar a month until $6.50 in all is paid. If you are not delighted with it, send it back in seven days and you will have risked nothing and will be under no obligations to us.

Be sure to state number of white keys on your piano or organ, also post office. Address Easy Method Music Co., 137 Wilson Bldg., Toronto, Canada.

ROGERS FUR COMPANY,
Dept. 332 St. Louis, Mo.

of Agriculture take up the question of marketing and find saitable workers for all fruit produced.

REPORT OF TREASURER.

Mr. H. Wilmot submitted his report which was referred to an auditing composed of Mr. S. L. Peters and Mr. Chas. Fulton.

AFTERNOON SESSION.

Chairman in few remarks stated that while some varieties could not be grown as well as in other provinces, still we can grow a number of varieties which are among the best, as well as any other provinces.

Mr. Smith, vice-president said he was in the small fruit business to some extent and considered it a very profitable business.

Mr. J. B. Daggett, Secretary for Agriculture was then asked to make a few remarks. He said he was pleased to see as many present as had come. It was very encouraging considering the bad travelling. Has always been interested in production of fruit and is satisfied that no mistake has been made in going into the fruit business. Thinks our fruit compares very favorably with that seen at Horticultural Show at Toronto. Mr. Daggett's motto is "Quality instead of Quantity. Strive to grow an A 1 fruit, and our returns will be very satisfactory." He congratulated the association on the very enthusiastic man they had in their secretary, Mr. Turney.

In closing, Mr. Daggett stated that the Department was willing to assist the farmers in every way possible, and that the fruit industry would be pushed to the limit.

REPORT OF COMMITTEE ON STANDARDIZATION OF SIZE OF APPLES.

Mr. Turney, speaking for the committee said they recommended that the delegates chosen for the Dominion Conference at Ottawa, together with Mr. S. L. Peters, confer at some future date before the conference. The recommendation was adopted.

DAMAGE BY DEER AND COMPENSATION BY THE GOVERNMENT.

Mr. Turney led in this discussion and said he was glad of the assurance of Mr. Daggett to help the farmers financially and hoped that some remuneration could be got for farmers whose crops were destroyed by deer. He had a number ol letters from various parts of the province complaining of damage done, also letters from other provinces, and some of the eastern States concerning the laws in this connection. In most every case the government would pay for damage done. There is no law to that effect in New Brunswick.

Several members stated that deer had been troublesome to them or to their neighbors.

A committee was appointed to adopt a resolution as to whether this Association shall confer with the Farmers and Dairymen's Associations, and to ask the government to ammend the law so that farmers may be remunerated for damage done to their crops by deer.

FRUIT SHOW FOR 1914.

It was decided to hold a fruit show in 1914, the date and place to be decided by the executive.

Mr. Hatheway suggested that each member send the surplus of his best apples to be used for the exhibit, providing the executive would guarantee as good returns as they otherwise could get.

Mr. Turney favored County exhibits This idea was quite popular.

It was decided to ask the government for an increased grant. $1000.00 was named.

GROWING NURSERY STOCK.

Mr. R. A. Filmore, Manager of Fruit and Farm Lands Co., Burton, gave a very interesting talk on the care of nursery stock. He said some seedlings were raised here from imported seed of the French crab. Some seedlings were imported.

Mr. Filmore gake a demonstration in root grafting, and explained the difference between root grafting and budding. He prefers root grafting because it can be done in slack time in winter.

Some trees grow very much faster than others. These may be sold to advantage at 2 years old, while the slower growing ones have to be kept for three years.

"Never buy trees kept in storage," said Mr. Filmore, as they are not likely to do well." Mr. Filmore also advised buying trees direct from the nursery, as there was then less danger of getting mixed varieties.

EXPERIMENTAL SHIPMENTS.

Some shipments of Duchess apples were made to the Old Country in 1912. The result may be found in the report for that year.

In the fall of 1313 some Dudley winter apples were shipped to Glasgow. On account of overripeness of the fruit, and the fact that they had to be hurried away before being properly cooled made it that considerable shrinkage occured, causing quite a loss. There were a hundred odd boxes sent to our advertising office at London which gave very good results.

The recommendation of the Nomination Committee was adopted in full. The officers elected for the ensuing year are as follows:

President, C. N. Vroom.
Vice-President, H. H. Smith.
Secretary- Treasurer, A. G. Turney.
Asst.-Treasurer, H. Wilmot.
Committeeman, Wm. Cobourn.

A very interesting feature of the meeting was the display of apples. By the courtesy of the British Columbia Government we had several boxes of British Columbia apples Along with these were some New

Threshers
Grain Drills
Feed Grinders
Knife Grinders
Binder Twine

INTERNATIONAL Harvester manure spreaders have a score of good features in their construction. Each one is the result of careful field experiment.

An I H C spreader is low enough for easy loading, yet it has plenty of clearance underneath. The rear axle is well under the load, rear wheels have wide rims and Z-shaped lugs, insuring good traction under all conditions. Frame, wheels, and all driving parts are of steel. Apron tension is adjusted by a simple device. Winding of the beater is prevented by large diameter, and beater teeth are strong, square and chisel-pointed.

International manure spreaders are built in several styles and sizes, low or high, endless or return apron, for small farms or large. Examination will show sturdiness of construction in every detail. Repairs, if ever needed, may always be had of the local dealer.

Examine International spreaders at the dealer's. We will tell you who sells them, and we will send you interesting catalogues.

Nova Scotia Farmers in Annual Session

(Continued from page 293)

J. A. Fraser followed Prof. Blair, and in the course of his remarks paid a high trihute of respect to the work that Col. Blair, father of the previous speaker, had done for agriculture in Nova Scotia. Several other speakers followed in the same strain.

A resolution tendering the hearty congratulations of the Association to Col. and Mrs. Blair on their having recently celebrated the fiftieth anniversary of their wedded life was unanimously passed and the Secretary was instructed to convey the same to Col. and Mrs. Blair.

After votes of thanks had heen tendered to the various speakers, to the citizens of Bridgewater, to the entertainers to representatives of the press and to all others who had helped to mave the Nineteenth Annual Meeting a success, the convention closed with the singing of the National Anthem.

Following are the resolutions passed:—

Whereas, the Live Stock Improvement Associations organized hy the Federal Department of Agriculture at Ottawa and the Agricultural Societies carried on under the puhlic statutes of the Province of Nova Scotia are doing almost identical work and have the same purpose in view, and, Whereas at the present time these organizations are promoted under different arragnements and are therefore liahle each to interfere with the other.

Therefore resolved, that the Nova Scotia Farmers' Association recommend that Mr. F. L. Fuller, Superintendent of Agricultural Societies, do confer with the Dominion Live Stock Commissioner with a view to co-operation in this work for the improvement of live stock.

* * * *

Resolved that the Farmers' Provincial Association suggest to the Exhibition Commission the advisability of providing sleeping quarters during the exhihition for live stock attendants, such quarters to he of such construction as to enahle them, under proper restrictions, to use oil lamps to heat their food.

* * * *

Resolved that steps he taken to form a central organization of the farmers of Nova Scotia for the purpose of co-operative purchase of fertilizers, feeds, seeds and farming implements.

* * * *

Whereas, the present arrangements for carrying visitors to and from the Provincial exhibition provide for one first class fare throughout the dates of the exhihition, with one excursion lasting only one day and,

Whereas, it often happens the day set apart for the special excursion proves stormy thus preventing a very large number from attending the exhihition.

Therefore resolved that the Nova Scotia Farmers' Association now in session respectfully ask the exhihition commission to endeavor to arrange for a special excursion to last during full period of the exhihition.

Further resolved that a copy of this resolution be sent to every Board of Trade and Municipal Council asking them to co-operate with this association and petition the railroad authorities rc the matter.

* * * *

Resolved that the Farmers' Association heartily endorse the resolution adopted by the Women's Convention at Truro, during the late Short Course held at the Agricultural College asking for a Women's Department in connection with the College where women and girls may he instructed in such of the arts as particularly come under women's realm on the farm.

* * * *

Whereas, The Dominion Experimental Farm for Nova Scotia, situated at Nappan, is primarily intended to be of educational value to the farmers of Nova Scotia and

Whereas, the railway accommodations are very unsatisfactory for visiting the farm,

Therefore, resolved that a committee representing this association be approached to hring this matter before the Minister of Railways through our members of Parliament.

* * * *

Whereas, under the present working of the Tile Drainage Act, it is difficult for the farmer to ohtain money for drainage purposes

Therefore resolved, that the Government be asked to so simplify the act that the farmer desirous of ohtaining money for such purpose be enahled to do so directly from the Government without the intervention of the Municipal Councils.

* * * *

Whereas, intending exhibitors at the Provincial exhihition in Halifax are desirous of placing their live stock on the grounds in very hest condition possihle and

Whereas, in the past stock has heen injured by over-crowding and unnecessary delay in transportation—many times cars having been side tracked for hours.

Therefore resolved, that this Nova Scotia Farmers' Association, in annual convention, respectfully ask the Exhibition Commission to take steps that in the future hetter and more rapid transportation facilities he provided to and from exhihitions.

* * * *

Resolved that this Association should take immediate steps at this session of parliament to have all agricultural implements placed upon the ahsolute free list.

* * * *

Whereas, exhihitions are very heneficial to live stock development, and,

Whereas, the excessive freight rates charged at present prohihit a large number of the stockmen from exhihiting their animals and,

Whereas, previous to 1910 exhihitors paid one full tariff rate to the first exhihition, one-half tariff rate to each subsequent exhihition and were returned home from the last exhihition free, and

Whereas, since 1910 full tariff rate has been charged on exhibits from first exhihition to each suhsequent exhihition with a free return home from last exhihition, and

Whereas, live stock has heen confined to cars for an unreasonahle length of time and has heen suhmitted to most cruel treatment hy heing shipped forward on way freight trains and often shunted ahout with cars of coal and other dead freight, particularly was this true in 1913 and

Whereas, a committee from the Maritime Stock Breeders' Association has heen apoointed to confer with the railway authorities with a view to materially reduce the present rates and secure morc rapid transportation of exhihits of live stock.

Therefore resolved, that the Nova Scotia Farmers' Association convened at Bridgewater appoint a committee to associate and assist the committee from the M. S. B. A. in securing improved conditions and,

Further rcsolved, that a copy of this resolution he sent to the Provincial Farmers' Association of New Brunswick and Prince Edward Island.

Comm ttee—Wm. O'Brien, Howard Corning, R. S. Starr.

Provincial Seed Fair.

The eleventh Annual Nova Scotia Provincial Seed Fair was held at the Agricultural College during the closing week of the Short Course and proved a splendid success and that of the exhibitor. Of the thirty-seven sections in the Prize List, only one failed to receive an entry. That one, calling for a variety of oats of inferior quality was put on the Prize List during the opening years of the Fair in response to the demands of a large number of farmers who wished to exhibit it. By means of the educational propoganda carried on in connection with the Seed Fair, however, the number growing this oat has been reduced until not one exhibitor put in an appearance this year.

The wide spread nature of the good seed movement in Nova Scotia is shown by the fact that exhibits came from practically every part of the Province, and included not only cereals, buckwheat, peas, beans and potatoes, but timotny, clover, turnip seed and corn as well.

Another pleasing feature of the exhibition, which deserves attention, was the increased tendency of farmers to grow improved strains of standard varieties and a corresponding decrease in the growing of new unproven ones.

Great credit is due to Mr. Landels, of the College staff, and Mr. S. J. Moore, of the Seed Branch, for their efforts to make this Fair a success. Great improvement has been made but we can confidently look forward to a larger and better Fair each year for some time to come.

Successful winners are as follows:

Wheat, White Fife—, J. E. Harrison, Maccan; 2, Geo. Milne, Woodburn, Pic. Co.

Wheat, Red Fife—1, J. A. McFarlane, Fox Harbor, Cumb. Co.; 2, J. R. Harrison, Maccan; 3, John W. Murray, Balmoral Mills, Col. Co.; 4, Robt. Kaulback, Middle Musquodoboit.

It Pays to Get Real Tested Seeds

For every cent you spend for seeds this spring you expect to reap dollars next fall.

If these fail you, you lose not only the cents you pay for them, but the dollars you should get in crops. You lose the labor, time and use of land in which you plant them.

That's why it is so important to get seeds that are tested and proven.

Carter's Tested Seeds are really tested by actual growing on the famous trial and testing grounds of James Carter & Co. at Raynes Park, London, England. They are tested for purity, germination, quality and production. At the same time other brands are tested alongside them to make certain that Carter's are superior.

Carter's Tested Seeds have made a big success in Canada because they have given most profitable results. They are your best seed investment.

Write to-day for a copy of the new Carter Catalogue of flowers and vegetables with all prices in American currency.

N. B. Fruit Growers in Annual Session

(Continued from page 307)

Brunswick apples, and it is interesting to note that they compare very favorably with the western fruit.

EVENING SESSION.

The evening session was held in the Provincial Normal School at 8.30 o'clock. The subject for the evening was an illustrated lecture on "Insects Injurious to Fruit," by Mr. R. P. Gorham.

Mr. Gorham showed slides of the more important apple insects, as codling worm, the borers, scale insects, brown tail moth, etc. He discussed their life histories and best methods of control.

At the close of his lecture, Mr. Gorham was tendered a very hearty applause.

FRIDAY JAN. 23.

Meeting called to order at 10 a. m.

Mr. Hatheway opened a discussion on "By-products of Apples." He pointed out that quite a lot of apples are not fit to market in a fresh condition, and suggested that an evaporating plant, a canning factory or a vinegar factory would be a more economical way of disposing of them. He also pointed out that there was quite a large and increasing demand for these products, and it might be warth while to investigate further. The chairman was of the same opinion. Mr. Peters, however, did not think that we would be in a condition to start anything of that nature for a number of years yet. The horticultural division was requested to investigate the matter for further information to be presented at the next meeting.

NEED OF SPRAYING IN NEW BRUNSWICK.

Mr. R. P. Gorham led the discussion. He told of some of the pests which with which the fruit growers had to contend, dealing more particularly with the apple scab and apple aphis.

During the past two years, both these pests have been very troublesome and the sprays used have not controlled them. Mr. Gorham pointed out the need of some experimental work to determine the relative value of lime sulphur wash and bordeaux mixture.

Mr. Hatheway has had the same results. Previous to the past two years he has always sprayed with bordeaux mixture. During the past two years he has used lime sulphar and has not been able to control the apple scab. He has nothing to show, however, that bordeaux is any better than lime sulphur, although his personal opinion is that it is better.

Mr. W. C. Gilman has had the same experiences and believes in the bordeaux.

Mr. T. W. Macoun, Dominion Horticulturist, then gave some of his experiences. Spraying has been carried on at the experimental farm at Ottawa, for the past twenty-one years, and good results are obtained. He said that bordeaux was a better fungicide but caused some russeting to certain varieties of apples. Their method of spraying is to use lime sulphur for the first or dormant spray, and bordeaux for the subsequest sprays. For scale insects, he has found that lime and water, at the rate of 2 pounds to 5 gallons, is the best remedy.

He also gave the conclusions reached by the Nova Scotia Fruit Growers. They are as follows:

I. The first spray should not be applied until the leaves are partly open. The strong spray seems to have no effect on the young leaves, while it is more apt to kill the germinating spores.

Have you received YOUR Copy?

Our 1914 Seed Catalogue is just off the Press.

It is the handsomest, most practical and complete seed catalogue published in the Dominion.

Just brimful of practical information.

D & F SEED CATALOGUE

consists of over a hundred pages. Printed in a clear, legible type and illustrated with over 150 beautiful photographic reproductions.

Contains nothing but the truth about D & F High Grade Seeds. No exageration. No extravagant claims.

One exhibitor at the Montreal Horticultural Exhibition, September 1913, received **58** FIRST Prizes on products grown from D & F High Grade Seeds.

This **proves** that D & F Seeds are High Grade.

Whether or not you have the 1913 copy of this remarkable catalogue, don't fail to get the 1914 edition.

It is more complete than any other we ever published.

Send a post card for your copy today.

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience**, we know better than any doctor; and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment. If you suffer from **pain in the head, back, or bowels, feeling of weight** and **dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid**, to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escapiug the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured**, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatmeut is for all,—**young or old**. To **Mothers of Daughters**, I will explain a simple home treatment which speedily aud effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask** for the **free treatment to-day**, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309, WINDSOR, ONTARIO

Try an ad in the Maritime Farmer—It will pay you

II. The bordeaux is a better fungicide than lime sulphur, although it causes russeting.

III. That it is best to use lime sulphur for dormant spray, and bordeaux for subsequent sprays.

It has been found that a mixture of flour will control red spider, and Mr. Macoun thinks that it may be of great use in controlling aphids.

NEW VARIETIES APPLES.

Mr. Macoun was called on to give some information on new varieties of apples. He stated that 140 new varieties of some value had been found out of the 800 tested in the last 25 years; 90 of the 140, he said, were very good. The idea in testing so many varieties, is to get hardy, early blooming varieties of good flavor. Some of the best seedlings come from seeds of Spy and McIntosh.

In discussing top-grafting, he said he did not consider it a good commercial proposition. Though some experiments should be conducted to determine which trees would form best union in grafting.

AFTERNOON SESSION.
BETTER FRUITS FOR LOCAL MARKETS.

C. N. Vroom led this discussion.

He said he would class the subject under three headings:

1. Varieties.
2. Condition of varieties.
3. The way in which the fruit was put on the market.

For a small orchard, for the purpose of supplying a local market, he thought it best to plant trees ripening their fruit at different periods, so that a succession of fruit could be had for the customers. In choosing the varieties for different seasons, it is best to plant only the ones that can be handled to advantage. He emphasized the fact that, while it was very important to have the best varieties, it was equally important to pack them attractively in some package suitable to the market.

Mr. Peters gave his experience in handling to advantage early apples of the Yellow Transparent type. He had got as high as 75 cents for a 11 quart basket.

Mr. Turney did not favor the basket, as it did not show the fruit to advantage. "The idea of this discussion," he said, "is to see if some suitable package can be adopted."

Mr. Dunphy tried the basket but had poor success in Fredericton market.

Some other gentlemen spoke but none had had experiences with baskets.

Mr. Charlie Williams, P. E. I., Horticulturist, was asked for a few remarks. He stated that conditions on P. E. Island were quite different to those of New Brunswick. However, they had same very good apples although they could not equal the New Brunswick apples.

In the matter of strawberries he thought they were ahead of any other province. The berries seemed to have a flavor all their own. He cited an instance where one farmer raised 11,000 boxes per acre, which is somewhat more than is produced in New Brunswick.

...

ORCHARD WORK ON P. E. ISLAND

Mr. Macoun gave a very helpful address on the orchard work on the Central Experimental Farm at Ottawa.

They have on the farm a plot of Wealthy's planted ten feet apart seventeen years ago. Since the trees got large enough to interfere with one another, every other one was cut out. Very satisfactory results were obtained. The net returns per acre, per year, during the seventeen years, averaged $87.00 per year, which is apparently a good investment.

"BEAVER" FLOUR is made of choicest Ontario Fall Wheat, with enough Manitoba wheat to add "strength" to the dough. This special blend gives the flavor, food value, baking qualities, strength and quantity, as no other one flour can.

When it comes right down to quality and quantity, "Beaver" Flour makes better bread and pastry—and more bread and pastry — than any western wheat flour.

You have only to use "Beaver" Flour once to prove all this to your complete satisfaction.

DEALERS — write us for price on Feed, Coarse Grains and Cereals. 137

THE T. H. TAYLOR CO., Limited, - - - - CHATHAM, Ont.

It would not be advisable to plant any variety other than Wealthys on this system.

CULTIVATION.

Mr. Macoun said that the plan which gave them best results, was to plow in cover crop as early as possible in the spring and after several harrowings at intervals of a week or so, to seed down again to a cover crop. A mixture of rape and vetch is cover crop used and is sown about the last of June.

MR. W. W. HUBBARD.

"It is the intentian af the Director to make the Experimental Farm at Fredericton a strong horticultural station," said Mr. Hubbard. Twenty-five acres were to be devoted to that division of the work, and nine of those were to be planted to orchard this coming spring.

Mr. Herbert Smith gave a talk on raising strawberries. He pointed out some of the important things to consider and was of the opinion that it was a good business if properly attended to. Would give a return of $400 to $500 per acre. Thought that it was not advisable to keep a patch more than one year.

ILLUSTRATION ORCHARDS.

Mr. Alexander and Mr. James Barnes said that the illustration orchards on their farms were doing well and that they were very much pleased with the results.

Mr. Turney gave some results from the Demonstration Orchards. These results are published in the Horticultural Report for 1912.

Before closing, a resolution was adopted, expressing the appreciation of this Association for all the assistance from the Department of Agriculture, and hoping that the Department would see fit to continue the assistance.

EVENING SESSION.

In the evening Mr. R. P. Gorham delivered an illustrated lecture on "Some Insects, Injurious or Beneficial to Garden Crops. Mr. Gorham explaindl the life histories of some of our worst enemies, also of some of our best friends among the insects, and described the remedies that are most practical. Before closing Mr. Gorham showed a few slides of beautiful New Brunswick scenery.

Can you arrange the above sets of jumbled letters into the names of eight well known fruits. If so, YOU CAN SHARE IN THE DISTRIBUTION OF THE ABOVE PRIZE. It is no easy task. But by patience and perseverence you can probably make out 5 or 6 of them. To the person who can make out the largest number we will give the sum of One Hundred Dollars. To the person making out the second largest number the sum of Fifty Dollars. To the person making the third largest number the sum of Thirty Dollars. To the person making the fourth largest number the sum of Twenty Dollars. Should two persons send answers equally correct, the first two prizes will be divided between them, (each receiving $75.00) Should three send in equally correct answers, the first three prizes will have to be divided, (each receiving $60.00). Should four persons send equally correct answers, the whole sum of $200.00 will be equally divided (each receiving $50.00), and so on in like proportions, provided they comply with a simple condition about which we will write as soon as answers are received. WE DO NOT WANT A CENT OF YOUR MONEY WHEN YOU ANSWER THIS ADVERTISEMENT. If you can make out anything like a complete list, waite us at once enclosing 2-cent stamp for our reply, DO NOT DELAY, WRITE AT ONCE. Address, CANADIAN MEDECINE CO., Dept. 81 MONTREAL, QUE.

Fertilizing the Potato Crop

The potato is the most widely grown crop in the world and is by far the most important of our vegetable foods.

The average yield of potatoes in Canada is slightly over 100 bushels per acre. Many farmers by proper fertilization, treble this yield. A yield of over 300 bushels per care is common in the potato districts of the Dominion. During the past season a yield af 735 bushels per acre was recorded in Nova Scotia. This was exceptional but it shows what can be done and should encourage many to try to increase their yield of tubers. The man who raised this tremendous crop of 735 bushels, FERTILIZED,—Using in addition to manure and Phosphatic fertilizers, 160 lbs. Sulphate of Potash. He realized that potatoes are gross feeders and require heavy quantities of AVAILABLE Plant Food, especially POTASH for their proper growth and sustenance.

POTASH IS THE CHIEF INGREDIENT IN A POTATO FERTILIZER

This is readily realized by a glance at the following figures:

A crop of 300 bushels removes from the soil, 105 lbs. of POTASH, 60 lbs. of NITROGEN and 30 lbs. of PHOSPHORIC ACID.

ENSURE TO YOUR POTATO CROP A READILY AVAILABLE SUPPLY OF POTASH, MURIATE OF POTASH AND SULPHATE OF POTASH can be obtained from the leading fertilizer dealers and seedsmen.

IF YOU CANNOT BUY LOCALLY, WRITE US, AND WE WILL ADVISE YOU.

"The Potato Crop in Canada" (4th Edition) is a bulletin published by the German Potash Syndicate. It deals with the cultivation, fertilization prevention of diseases, etc., and contains interesting resultss of fertilizer experiments. This bulletin will be mailed FREE, together with any of the following, to any address in Canada.

"Artificial Fertilizers; Their Nature and Use."
"The Principal Potash-Crops of Canada."
"Fertilizing Orchard and Garden."
"Fertilizing Grain and Grasses."
"Fertilizing Hoed Crops."
"Farmers' Companion," etc.

Feed and Profit.

We came across two records recently that set us thinking. A Jersey cow that gave a yield of 14,450 pounds of milk and 727 pounds of fat, consumed an average of 12.4 pounds of meal per day all year. An Ayrshire's record was almost identical, 12.8 pounds of meal per day. Just what the average cow in Canada receives as meal is uncertain, but this is certain that vast numbers of them would do infinitely better if they got the opportunity and were fed on the basis of one pound of grain for every three or four pounds of milk per day that they yield.

As the average cow in Canada gives probably only about one hundred and forty pounds of fat per year, it is a question if she gets an average of three pounds of meal per day. The two cows noted above received four times this amount, and paid for it. More of our cows would pay, that is pay a good profit above the cost of feed, if they got the right feed.

When we find good dairymen willing to give seventy or eighty dollars worth of feed to a cow per year, it means they not only have faith in their judgment, and in the cow's productive ability, but beyond this, they keep records both of milk and fat produced, and feed consumed, so as to be perfectly certain they don't waste good feed on cows that don't produce.

Feed record forms and a herd record book will be supplied free on application to the dairy division, Ottawa. Make sure each cow pays a good profit this year.

The 1914 Short Course

Editor The Maritime Farmer—

The two week's Short Course at the Nova Scotia Agricultural College was completed on Friday, Jan. 16th. The enrolled attendance was 351, which is the record for the institution. Of this number forty came from New Brunswick, upwards of ten from various parts of America, and the balance from the Province of Nova Scotia.

Not only in numbers but in the character of the work and enthusiasm the Course of 1914 stands out as the most successful of the series that have been held during the past ten years. As each year goes by one becomes more and more impressed with the fact that the Maritime Province farmers are realizing their Agricultural possibilities and that the movement toward improvement of agricultural conditions is gradually gaining force and will lead before many years pass by to the Maritime Provinces taking the place which they were always intended to take among the foremost agricultural parts of America.

M. CUMMIEG.

Don't fail to listen attentively and patiently to all the little trials which come into the lives of these small people. Help adjust them, and remember that at six they are as great in proportion as those which daily come into your own life.

Make your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosine Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosine oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the Interior of the dome of the "Great White Light" Burner are the marvellous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosine oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oll itself, although bofh are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT** it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely diffenent, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. Send today.

We guarantee these burners to do as represented or money refunded.

The Maritime Farmer

SUSSEX, N. B.

We do not sell these burners but each subscriber may get two besides one we furnish free by sending 35 cents for each additional one wanted.

The Story of the Prince Edward Island Egg Circles

Early in July, 1912, Mr. W. A. Brown, B. S. A., Chief of the Poultry Division of the Live Stock Branch Department of Agriculture, Ottawa, visited Prince Edward Island to investigate the poultry industry of that Province. Mr. Bsown stayed in the Province for some weeks, visiting the farmers and those who were handling the egg trade in the rural districts, Charlottetown and some of the large towns. In addition to making a very thorough investigation, Mr. Brown delivered addresses at many different points, and this assisted him greatly in that he was able to meet large numbers of farmers and others and familiarize himself, not only with existing conditions, but also with the views of all concerned, and the future outlook. The impression left on Mr. Brown's mind was that conditions justified special assistance being given to Prince Edward Island, that reforms in all departments were needed and that in no part of the Dominion was there a greater future in store for the poultry industry than in this wonderful little Province. Mr. Brown on his return to Ottawa reported accordingly. The result was the appointment of Mr. T. A. Benson as Dominion Poultry Representative on the Island. Mr. Benson, who had for some time held the position of assistant District Representative for Ontario County under Mr. J. H. Hare whom he assisted to organize the successful Ontario County egg circles, landed on the Island at the end of September 1912, and with the co-operation of the Provincial Department of Agriculture immediately set about investigating conditions.

The winter was spent in this way and delivering addresses in the rural sections preparatory to organization work. In the spring of 1913, organization of egg circles commenced and in all some eighteen egg circles have been organized up to this time, some of them quite recently.

These associations have been well spread over the Province with a view to demonstration and are located as follows:

Prince County—Kensington, Darnley, Mt. Carmel, Lower Bedeque, Central Bedeque, Grand River, Miscouche.

Queens County—New London North, Springfield, Wheatley River, Hope River, York, Bedford.

Kings County—Brooklyn, Southern Kings (Murray River), Red House, New Perth, Georgetown.

So far 581 farmers have been registered as members of one or other of these circles. 381 additional stamps and ink pads for stamping the eggs, have been sent out to managers upon their request. 56,473 dozens of eggs have been shipped to the Montreal markets at an average premium over local prices of at least 3½ cents per dozen after expenses being deducted and not taking into account an undue inflation of prices by those in strong opposition to the movement.

Quality and new-laidness have been the watchwords of these associations and deteriorated eggs have been sharply discriminated against. The Brooklyn egg circle sent out one shipment of 270 dozens to Montreal which was described by the buyers as a shipment that any egg circle in the Dominion might well be proud of, it was a record!

The extra profit to the producers is simply due to the elimination of waste and unnecessary handling as a result of the interest awakened which may be described as almost phenominal. Mr. Benson now has on file in his office applications from 56 different sections, of the Island for organization many of which take the form of demands and these in addition to applications for lectures.

Mr. Benson is a busy man, continually travelling up and down the Province and cheering on his friends, the farmers, and it looks as if the work is growing too rapidly for one man to cope with it and according to Mr. Benson the credit lies with the farmers of Prince Edward Island, whom he describes as far-seeing, intelligent fellows who are ready to take hold of a fair business proposition.

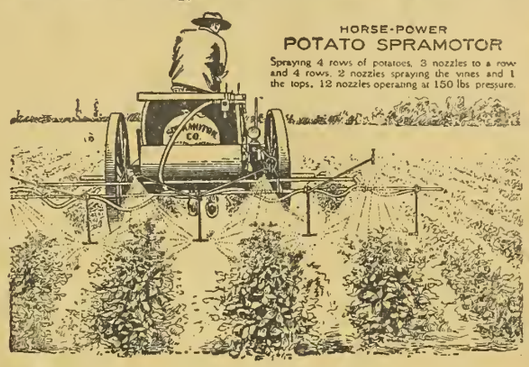
Destruction and Preservation SPRAMOTOR Accomplishes Both

There are countless enemies to your prosperity this season, and every other season. **Spramotor destroys** bugs, parasites, insects, worms. spores, lice, blight, rot, canker, scale, fungi, slugs, scab, caterpillars, beetles, etc.

All these pests can undo your hardest work and bring your labor to naught. There is one efficient way to fight them, saving yourself the dollars they would devour, and that is to get a **Spramotor** and let it do the work of destruction **thoroughly** in its own economical way.

For purposes of preservation, the **Spramotor** will whitewash or paint barns, stables, hen houses, granaries, silos, sheds and farm buildings generally.

You can spray on fire-proof or ordinary paint at half the cost and in one-tenth the time. It means all the difference between having dirty, unsanitary outbuildings and clean healthy vermin-proof places to house your live stock, chickens and other possessions.



HORSE-POWER
POTATO SPRAMOTOR
Spraying 4 rows of potatoes, 3 nozzles to a row and 4 rows, 2 nozzles spraying the vines and 1 the tops, 12 nozzles operating at 150 lbs pressure.

Spramotor for Weed Extermination

Wild mustard can be killed in the growing grain at a cost of only 60 cents an acre—with a **Spramotor.** You can clear your land of all noxious weeds just as cheaply and turn unproductive tracts into big money-makers. Here are some figures for you:—A plot of land (**sprayed**) produced 84 lbs. of crop and 1½ lbs. of mustard. A plot exactly the same size (**unsprayed**) produced 16 lbs. of crop and 112 lbs. of mustard. Was the **Spramotor** worth its cost in this case ?

Contented Cows Give More Milk

It is a recognized fact that during the fly time, milch cows are liable to be so pestered and tormented by stinging flies and biting insects that the milk yield falls off noticeably. Dairymen have hitherto accepted this situation as something unavoidable but latterly some of them who own **Spramotors** have taken to using it to give the animals a thorough spraying with fly repellant, not only affording the tortured beasts ease and comfort but causing them to yield fully one-third more milk than before. Surely, if you are without a **Spramotor,** you realize how much you can benefit from owning one. If you believe that fuller information on your own particular case would be worth while, take advantage of the following:

FREE Write us telling what you need a **Spramot** or for and we will send you complete information of the best style of machine to fit your requirements. We will also forward you a copy of our valuable illustrated book on Crop Diseases FREE This puts you under no obligation whatever, so don't delay—write while the matter is in your mind.

We Make Spramotors in over 50 Different Sizes

From the No. O. Hand Machine at $6 to the $350 Gasoline operated outfit. Our wide range of designs and sizes embraces machines for every conceivable purpose, suitable to the spraying needs of the small farms as well as the largest in Canada.

SPRAMOTOR CO.,

1721 KING ST. E, LONDON, CANADA

Dairy Acres

While glancing over the results of the dairy herd competition given at the recent dairy convention, one could not help being struck by the yields—7,317 pounds of milk: 214 pounds of fat per cow.

During the same session a chart was displayed indicating that some dairy farms are producing very little milk, one was listed giving a yield of only 125 pounds of milk per acre.

With a dairy farm growing corn, oats, clover and alfalfa, and having pretty good pasture, it should not be very difficult to produce 2,000 pounds of milk per acre and at the same time increase the fertility of the soil. This system should yield an income of over thirty dollars per acre instead of the insignificant average of five dollars and seventy-nine cents which was the average yield per acre cultivated including pasture given officially as the average return from cows; are yours just common acres, acres need not be idle more than the five thousand cows in Ontario. The or dairy acres?

The herd will average up better if the poor cows are weeded out. Do you know for certain which they are? You can easily detect them if you keep records on forms supplied free by the dairy division, Ottawa. State in your letter if you want forms for weighing every day, or only on three days per month. Is there any good reason why your cows should not average at least six thousand pounds of milk? Many men are getting this, and more, but they don't do it until they keep records and know which cows should be kept and which should not.

Halter Pulling.

A. G. G., has a horse that pulls on the halter strap until it breaks. The only thing that can be done in such a case is to tie the horse with a strong rope put around its neck. For the first few times that the horse is tied with the rope one should stand beside it to be ready to untie the rope in case the animal should cast itself. Usually after it pulls a few times on the rope and cannot break it, it will stop pulling.

There is no better medicine made for colds than Chamberlain's Cough Remedy. It acts on nature's plan, relieves the lungs, opens the secretions, aids expectoration; and restores the system to a healthy condition. For sale by all dealers.

Dr. Morse's Indian Root Pills

are just the right medicine for the children. When they are constipated —when their kidneys are out of order —when over-indulgence in some favorite food gives them indigestion —Dr. Morse's Indian Root Pills will quickly and surely put them right. Avoidable Causes of Lameness and Disease.

It is a fact that a very great proportion of the lameness, disease, and ailments which occur among horses is brought about by avoidable causes, and could readily be prevented if a more general knowledge were displayed in regard to their origin. To commence with the horse's foot, we have, for instance, corns, and probably quite three-fourths of the cases in which this complaint occurs would never be heard of if horses were always re-shod at sufficiently frequent intervals, for corns are principally brought about through the shoe becoming embedded in the heels owing to the shoes being left on for too long a period. Equally avoidable is the other chief cause of this trouble, which consists in the shoes being made too short and fitted too closely at the heels, so that the ends are liable to press injuriously upon the so-called seat of corn. That serious disease, fever in the feet, termed laminitis by the veterinarian, and in stable parlance generally known as founder, is very often due to errors in feeding, such as providing a too stimulating or heating diet, using beans too lavishly when the work is too heavy, or overfeeding a horse with corn when it is getting only very little exercise. In the hunting season, for example, this disease is not infrequently found to develop in hunters during spells of hard frost, when they are thrown out of work, if care is not taken to guard against this by reducing the corn ration and stopping the giving of beans, as well as exercising the hunters plentifully on a straw track. Omitting to exercise horses which are standing idle in the stable is another contributory cause of fever in the feet easy to be avoided. Cracked heels, which so often occur in the winter, are in most instances the result purely of neglect, and principally from one of the following causes: Owing to the hollow of the heel not being properly cleaned when the horse is groomed; keeping horses standing on dirty and wet bedding; washing the legs; and, in the case of animals specially susceptible to suffer from cracked heels, failing to dry the heels well on the horse coming in from work with muddy and wet legs. Mud fever, another winter complaint, could also in most cases be avoided if the baneful practice of washing the legs were refrained from, and if, where there is an inherent tendency to mud fever, care were taken to see that the animal's belly, thighs, and legs are well rubbed down with wisps of straw and thoroughly dried when it returns to the stable in a muddy condition, and the legs bandaged. Thrush, or foul in the foot, again, is mainly induced by standing on dirty litter and omission to clean out the sole of the hoof, while the paring of the frog by the farrier, which is an entirely uncalled for and pernicious practice, is also a great contributory cause of the complaint.

SPRAINS. ...

Sprains of the back tendons, fet- tributable to want of care, or mis- which for the greater part it would not have been easy or possible to prevent, for, although in most cases the result of over-straining the part involved, and they would not perhaps have arisen if the horse had been used with greater care, there remains the fact that a certain amount of risk of sprain is practically unavoidable whenever horses are called upon for more than average efforts or exertion, such as jumping, fast galloping, hauling a very heavy load uphill, etc. In order to preclude such risk entirely, one would have to use horses so carefully and be so particul-

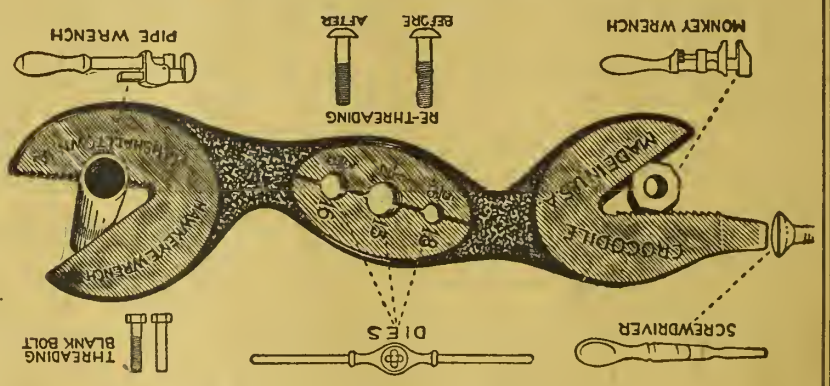
The Crocodile Wrench

An All Around Handy Tool for the Home, Farm and Shop



Six Handy Farm Tools in One

The Crocodile Wrench is drop forged from the finest tool steel and scientifically tempered. Every wrench guaranteed against breakage. It is 8 1-2 inches long and weighs ten ounces.

A pipe wreuch, a nut wrench, a screw driver and three dies 5-16, 3-8 and 1-2 inch for cleaning up and re-threading rusted and battered threads, also for cutting new threads on blank bolts. Dies will fit all bolts used on standard farm machinery.

Teeth and dies are case-hardened in bone-black, making them hard and keen.

The dies on this wrench alone would cost $1.50, and would be worth more than that to every farmer, as they would often save valuable time, besides an extra trip to town for repairs.

Sold everwhere for 75 cents cash.

How to Procure a Crocodile Wrench

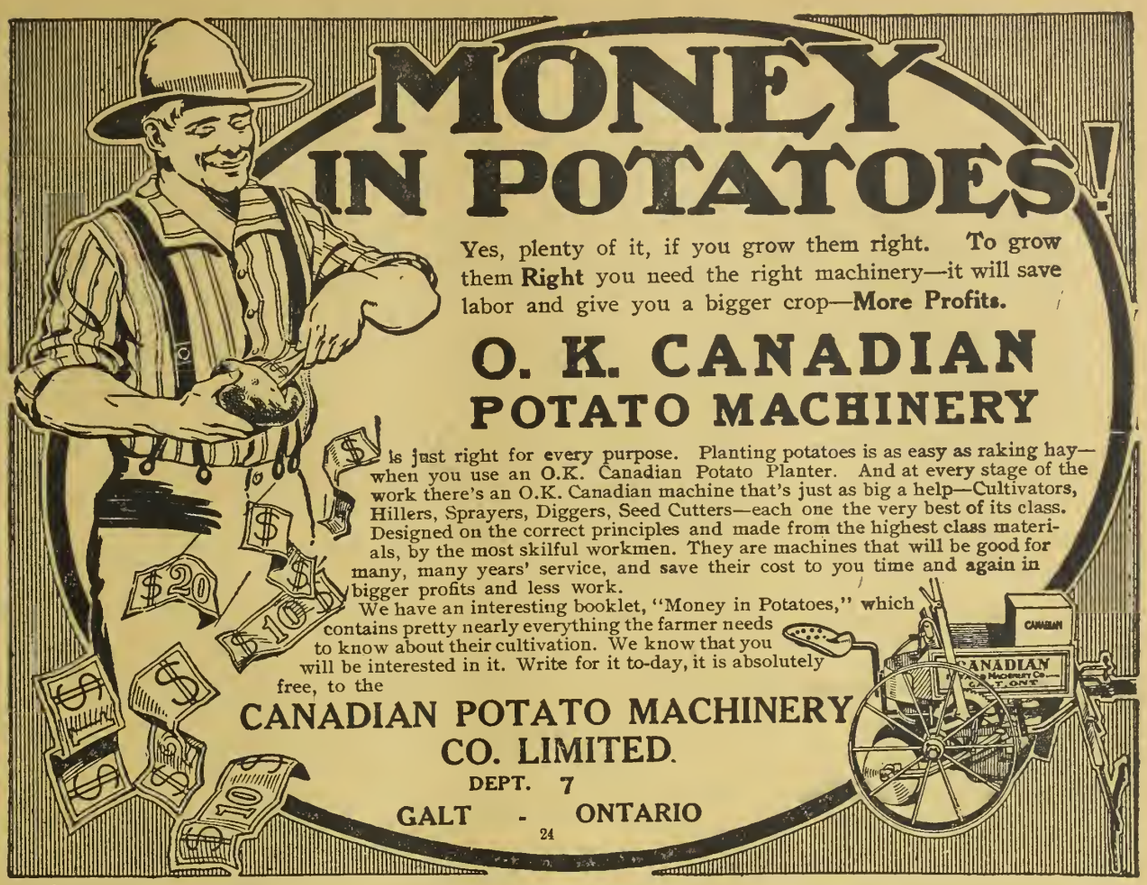
On receipt of $1.00 we will send you the Maritime Farmer for one year and also one of these Crocodile Wrenches. New subscriptions will date from time of receipt, renewals from date of expiration of present subscriptions. Or for 75 cents cash we will send you a wrench.

The Maritime Farmer, Sussex, N.B.

ar about not putting any strain on the legs and joints, that it would be impossible to make full use of them, while all galloping and jumping would have to be abstained from. However, the likelihood of sprains occurring is greater in certain circumstances than it normally is, and their occurrence is entirely attributable to causes that could easily be avoided. For example, sprains and injuries to the hocks are most liable to result if horses are galloped or jumped much when they are in soft or green condition, or through galloping or cantering a horse on hard ground. In the case of cart-horses, their hocks often get badly injured and become unsound through making them back an excessively heavy load, which puts an in' ordinate strain upon these joints, such cases would, of course, not happen if it were not for carelessness or ignorance. Negligence, again, is not infrequently the underlying cause of capped hocks, this trouble in some cases being brought about as a result of ahorse being made to turn round in a narrow stall and hitting the points of its hocks against the stall partitions, which, if constantly repeated, is very liable to lead to their getting capped in the end. This result can easily be guarded against by backing the horse out of its stall and turning it round in the stable passage.

BROKEN WIND.

Many cases of broken wind are attributable to want of care, or mistakes in the management of horses. Thus, a principal cause is feeding them on damaged or excessively dusty forage, while often it is caused through driving or riding horses too fast when their stomach is much over loaded with food, or by exerting them too severely when they are not in fit working condition, and especially if they carry a big grass belly. Over-exertion is one of the chief causes of congestion, which so often is the forerunner of inflammation of the lungs. Colics, again, are principally brought about through errors in dieting or watering, while most cases of impaction of the bowels probably occur simply from the neglect to provide a sufficiency of laxative food in the dietary. Coughs and colds would not be nearly so rampant as they are in winter and early spring if stables were kept less close or hot, and if greater attention were bestowed on the question of ventilation. Poll evil is mostly the result of carelessness or rough management for the chief causes of this trouble consist (1) in in the horse receiving a blow on its head through hitting it against the lintel of the doorway—an accident which ought not to occur if ordinary care is observed—and (2) in the part being injured through the heavy cart-horse collar being clumsily and roughly put on or taken off.—Argus in Farm and Home, England.



MONEY IN POTATOES!
Yes, plenty of it, if you grow them right. To grow them Right you need the right machinery—it will save labor and give you a bigger crop—More Profits.
O. K. CANADIAN POTATO MACHINERY
is just right for every purpose. Planting potatoes is as easy as raking hay—when you use an O.K. Canadian Potato Planter. And at every stage of the work there's an O.K. Canadian machine that's just as big a help—Cultivators, Hillers, Sprayers, Diggers, Seed Cutters—each one the very best of its class. Designed on the correct principles and made from the highest class materials, by the most skilful workmen. They are machines that will be good for many, many years' service, and save their cost to you time and again in bigger profits and less work.
We have an interesting booklet, "Money in Potatoes," which contains pretty nearly everything the farmer needs to know about their cultivation. We know that you will be interested in it. Write for it to-day, it is absolutely free, to the

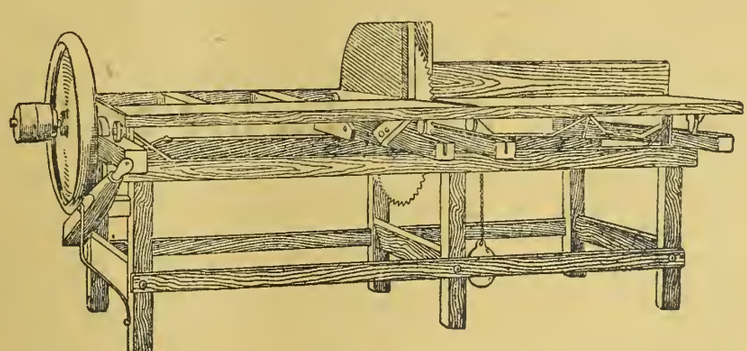
WOOD CUTTERS

Made in Four Different Sizes



We are offering these machines to the public with the belief that they are the best wood cutting machines on the market for the money. The Frame is made of the best seasoned hardwood, and well bolted and braced. The Arbor is of the best turned steel, and runs in bearings made of the finest quality babbit. The Balance Wheel is a solid web and weighs 180 lbs. The Table is of heavy Plates and indestructable. Wood Cutters are shipped with 28 in. saws unless otherwise ordered.

Remember we manufacture the celebrated Little Giant Thresher, The Sussex Root Pulper, Farmer's Feed Boilers, Grain Grinders, Hay Presses and Plow Castings.

The SUSSEX MANUFACTURING Company Limited, SUSSEX, N. B.

FLORICULTURE.

W. S. St.John, writes:—Please tell me what to do for a plant of asparagus which is in a large pot. It has been growing well until since the first of the year. It was repotted last spring and on emptying it out of the pot last week I discovered that the roots are full of lumps. Is this a disease, and what should be done?

The large lumps are quite natural parts of the roots. They hold a reserve supply of water for the plants. Your plant apparently needs repotting and if done at once you will probably find that it will come out all right.

Ivy, of St.John, writes:—I have two Boston Ivies that were planted last spring but owing to sickness I was unable to have them protected in the fall. They look black now. Are they killed or if only the top damaged would it be possible to save the roots if cared for now? What would be the best thing to use for covering the vines where three feet long?

The Ivies are probably all right yet as they are usually damaged in early spring. Cover at once with brush so that both roots and tops are covered a little. Strawy manure or straw alone placed about the base of the vine before the brush is put on will be a great help.

Hyderangeas required for early flowering should be started new. Water rather sparingly until foliage appears.

Early planted Freesias should be well started in bud now. Keep them well staked and water freely until done flowering, when they should be gradually dried off, leaving the bulbs in the pots, then remain dry until planting comes again next August or September.

Water carefully for the red Spider on the Palms and Rubber Plants from now on. Frequent spraying or sponging of the under sides of the leaves is a sure preventative as well as a remedy.

Pansy seed for the very early plants should be sown immediately. Buy the choicest seed only and preferably in separate colors. There is such a large list of separate colors advertised by all leading seedsmen, that one can select the colors that appeals to one's taste with the assurance that a large number of the plants will be true to name.

Plants grown from seed sown this month would require to be transplanted into boxes in the house, and again transplanted into hot beds or frames in the early spring. They thus make large plants in bloom for May planting out of doors.

A. N. S. A. C. Graduate Secures a Good Position.

A recent issue of the Middleton Outlook says:—

"Mr. Malcolm B. Davis, who has been employed on the Sdnnyside Experimental Farm, left on Friday last for Ottawa, where he has accepted the position of Assistant in Pomology to the Dominion Horticulturist. We understand that the first work of Mr. Davis in his new relation is to be a series of addresses in the MacDonald Agricultural College, Montreal. During his stay among us Mr. Davis has given several public addresses on subjects connected with his department, which have shown him to be quite up-to-date in his knowledge and a clear and ready speaker. He has won a host of friends among us by his genial and unaffected manner, all of whom congratulate him on his promotion, and wish for him very great success. His place at the Sunnyside Experimental Farm will be filled by Mr. Morley Pike, who with his family, will arrive in due time."

Mr. Davis is a graduate of the N. S. A. C.

460 Pounds at 8 Months.

Joseph Oxener, of Lower La Have, Lunenburg Co., recently butchered an eight months old pig that, when dressed, tipped the scales at 460 lbs.

This record beats anything sent in this year. Our friend, Harry, who raises the big ones up in York county, will likely do his best to break this record next year.

Breeding and Feeding the Champion

After the winning of a grand championship for the best fat steer at a big show there is always some curiosity as to how the champion was produced. This year emphasis has been laid on the fact that Glencarnock II., champion at Chicago, was not fed very much corn. Here is the story of the steer as told by Wm. Bowman of Rugby stock farm, and father of Henry Bowman, who fed the steer.

'Four years ago last March, we arrived at Forrest. That spring Mr. McGregor had more calves than he had milk for, so he gave us three. One of them is the dam of the steer. She was two years old when the calf came. He was a very small wolly little fellow, but I was struck with his splendid outlines, so, half in fun and half in earnest, I told my boy, Harry, that he looked good enough to make a Chicago champion, and I told him to go after him, and he could have all the prize money the steer would win. So between us he was fed and developed.

"As to his feed. He sucked his dam from September 26, 1911, until June, 1912, when we got a fresh cow for him. This cow fed the calf until October, 1912. Then we gave him another cow to go to Chicago a year ago. He won first prize as a senior calf and was also champion grade calf and reserve champion calf. He was brough home and fed for Brandon Winter Fair, where he won grand champion honors. In May, 1913, he was put on another foster mother and was kept on her until he left for Chicago.

"He never was fed out of a book, but out of the hand of common sense. As to what weight of grain or roots he received as a feed, we have no idea; we don't know how to feed stock by pounds. He was always fed what he could clean up, of principally oat chop and whole oats, and some barley chop and bran. He was out for exercise almost every day, and during the warm season, at nights. He always had water before him. He has never tasted medicine or artificial foods, and perhaps a year ago he was fed a little molasses or molasses meal and oil meal. There was nothing supernatural about his feeding and care, but a constant care as to feed and comfort, Harry always directing his feed. He has not eaten 10 bushels of roots or corn."

DEALERS WANTED

The very active interest taken by farmers throughout the Dominion in better methods of fertilizing, has created an astonishing demand for Davies Special Mixed Fertilizers.

As we want to supply this demand through dealers, we are offering an attractive proposition to reliable parties in Ontarin, Quebec and the Maritime Provinces, who can handle quantities of 20 tons (minimum carloads) or more. This proposition is open to anyone, whether regular fertilizer dealers or not.

It offers a very profitable side line for Seedsmen, Implement Dealers, Flour and Feed Men, Millers, and progressive Farmers, in districts where we are not at present represented.

DAVIES SPECIAL MIXED FERTILIZERS

have an extremely good performance record, having produced remarkable results for many farmers. They are prepared by using only the highest quality materials and are mixed under the supervision of experts. They are put up in 125 lb. bags (barrels if desired).

Goods are guaranteed to be in perfect condition.

We especially recommend our factory mixed high-grade fertilizers analyzing from 6 to 10% POTASH.
This is a splendid opportunity. Write us immediately about it before all the remaining territory is taken up.

The William DAVIES Company Limited

West Toronto, Ontario.

Convincing to Ladies— This Oven Test!

PURITY

So that you may use less flour, we do what a home cook would do if she were in our place.

From every shipment of wheat delivered at our mills we take a ten pound sample. We grind this into flour. Bread is baked from the flour.

We find that some samples make more bread and better bread than others. So we keep the shipment from which the more and better bread comes. The others we sell.

You save money by using flour that bears this name. And you get better bread.

"More Bread and Better Bread" and "Better Pastry Too"

521

A COLD Developed Into BRONCHITIS.

However slight a cold you have, you should never neglect it. In all possibility, if you do not treat it in time it will develop into bronchitis, pneumonia, or some other serious throat or lung trouble.

Dr. Wood's Norway Pine Syrup is particularly adapted for all colds, coughs, bronchitis, pneumonia, asthma, whooping cough and all troubles of the throat and lungs. Three points in favour of Dr. Wood's Norway Pine Syrup are: 1. Its action is prompt. 2. It invigorates as well as heals, and soothes the throat and lungs. 3. It is pleasant, harmless and agreeable in taste.

Mrs. Albert Vait, Brockville, Ont., writes:—"Just a line to let you know about Dr. Wood's Norway Pine Syrup. Our oldest little girl is now six years old. When she was four months old she got a cold which developed into Bronchitis, and we tried everything we could think of and had two doctors attending her, but it was no good. One day I read in your almanac about Dr. Wood's Norway Pine Syrup, so I tried it, and before she had finished one bottle of it, the dry hacking cough had nearly all gone. There is nothing equal to it, and we are never without it in the house."

See that you get "Dr. Wood's" when you ask for it, as there are numerous imitations on the market. The genuine is manufactured by The T. Milburn Co., Limited, Toronto, Ont.

Banish the Lice.

Between now and spring it will be a common sight to see horses, especially young stock, which is being kept in rubbing tails and neck against fences and buildings. When stock do this they have lice and are not only uncomfortable but cannot thrive. Then there is a job or two to do at once. First, clean out the stable, every corner of it, and apply a whitewash prepared as follows:

Slake half a bushel of unslaked lime with boiling water, cover during the process to keep in steam, strain the liquid through a fine seive or strainer, and add to it a peck of salt, previously dissolved in warm water, three pounds of rice boiled to a thin paste and stirred in while hot, half a pound of Spanish whiting, and one pound of clear glue, previously dissolved by soaking in cold water and then hanging over a slow fire in a small pot hung in a larger one filled with water. Add five gallons of hot water to the mixture, stir well, and let it stand for a few days, covered from dirt. It should be applied hot, for which purpose it can be kept in a kettle or portable furnace. The east end of the White House in Washington is embellished by this whitewash. It is recommended by the government for whitewashing lighthouses.

A pint of this wash mixture, if properly applied, will cover one square yard, and will be almost as serviceable as paint for wood, brick, or stone, and is much cheaper than the cheapest paint.

Next take the horses or colts and clip the hair off around the tail along the back and on each side of the mane. Then rub on a solution made by dissolving one ounce of stavesacre seeds in one and a half pints of water boiled for two hours, keeping the water up to the quantity commenced with. Of course, the clipping can be dispensed with, but the solution will be as effective and more will be required. Other parts of the body may also require treatment such as the under side of the neck and along the fore ribs.

Worms.

O. M.—Will you kindly favor me by letting me know how to get rid of worms in draught horses. It is tape worm, not bots, which is worrying me.

Prepare the horse first by fasting him a day or so on a light diet. Then give him the following:

Three drams male fern, 2 ounces turpentine, 6 drams B. Aloes, 1 pint linseed oil. Give him a bran mash the following morning and the results will be satisfactory. This is the dose for a large draught horse so you can act accordingly as to the dose for your own.

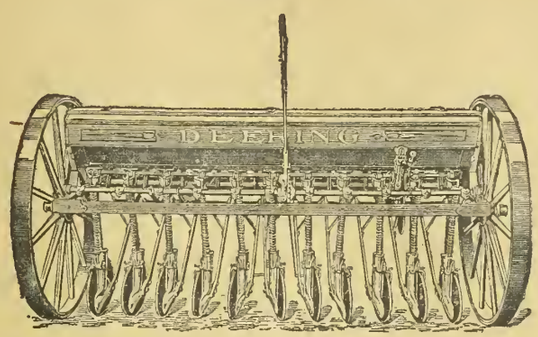
Good Rich Milk.

The critical consumer of milk may give a snap verdict on the glass of 'good rich milk' given him in the restaurant or at home, and may vaguely wonder what percentage of fat the milk is supposed to contain. Certain standards of richness are fixed by various countries, and by municipalities, while some purchasing companies and dealers also set a standard below which the milk must not fall.

The knowledge of the average test of the herd, interesting as it is, is not as valuable to the progressive dairyman as a knowledge of what each cow's milk tests. Whether it is 2.9, 3.4, 4.5, or 5.6 per cent of fat depends on various factors, and can only be asceratined after systematic sampling and testing. Such testing sometimes reveals curious facts. A pet cow whose 'good rich milk' was reserved for table use was recently disgarded by a farmer when cow testing proved to his dismay that her milk was nearly the poorest in the herd.

The average test of the herd is a vital matter to everyman whose milk is paid for at the cheese factory by the test; it is of decided importance to both creamery manager and patron when considering the by-product of skim milk for feeding, and the loaded wagon for the cream hauler. For two lots each of 16,500 pounds of normal milk may contain either 500 or 900 pounds of fat; one lot is scarcely the best for cheesemaking, while the other would be 'good rich milk.'—C. F. W.

Deering Drills



GIVE your seed a chance to produce a record crop by sowing it with a Deering drill. Deering disk and hoe construction puts the right amount of seed in the right position at the bottom of the furrow, to insure your getting a full even stand of grain.

No matter whether your ground is hard or soft, gravel or clay, smooth or rough, level or hilly, there is a Deering drill in the line that will plant your seed as it should be planted.

Examine Deering drill construction and the many features. Note the light draft, the large capacity grain boxes, the double-run force feed that handles all kinds of grain and seed, the ease of regulation to suit soil and seed—and a dozen other points to grow enthusiastic over.

See the drills themselves at the I H C local agent's place of business. Our catalogues tell you all the features of all the types. Get catalogues from the local agent, or write the nearest branch house.

High Quality Builds Big Telephone Business

THIS business was organized to manafacture telephone equipment for independent and municipal systems. Right from the start our equipment made records for efficiency. It did not take long for our goods to acquire a reputation for quality and reliability. As a result, our business has grown by leaps and bouuds.

It is a well known fact that we have been securing over 80 per cent. of the new telephone business in Ontario. The business, too has been secured with less effort than business secured by competitors. The satisfaction our telephones and equipment have given under all conditions have paved the way for easy business getting.

To judge how fast our business is growing, you'll remember we stated in a previous announcement that our business last year doubled that of the year before. Well, this year the first two months' sales total more than twice the 1912 sales for the same period. More and more is it being recognized by those in the telephone business, that we are the legitimate people to deal with. There are those in the telephone business who are interested in depreciating the success of the independeht telephone movement and the development of municipal systems. On the other hand, our business lies wholly and directly with the independent telephone systems and it is to our own best interests to look after those systems well, as on their success depends the growth of our business.

If you would like a list of the large independent telephone systems built in Ontario during the last twelve months, just drop us a line. We would be glad to send you a list of the systems, with the make of the telephones they are using. In fact, if you'll name over the large independent systems built during the last year in Western, Northern and Eastern Ontario you'll find that nine out of every ten are using our telephones and equipment.

You are absolutely safe in equipping your systems with our telephones. We guarantee them as regards material and workmanship. In fact we guarantee all our equipment and materials. And in addition we offer to send our telephones for **Free Trial**, so you can test and compare them with others right on your own lines before risking a dollar.

Ask for our No. 3 Bulletin—containing the latest information about building telephone lines—Also No. 4, describing our magneto telephones, is free on request.

Send for a Copy.

Barred Plymouth Rocks

Victors again at Maritime Winter Fair, 1st and 2nd Mating Pens. 1st Breeding Pen. 1st pair of Utility Cockerels; 1st and 4th Cock; 1st and 6th Pullet; 2nd, 3rd and 6th Cockerels; 3rd and 5th hen is Record for 1913. Lusty Cockerels and Cock birds for sale. Address

CRAIG BROS., Amherst, N. S.

DURHAM BULLS

Six nice pure bred Durham bulls from eight to fifteen months of age, out of heavy milking dams, for sale.

C. C. H. EATON,
Canard, - - Nova Scotia

SPECIAL SALE

1 Barred Rock Cockerel and 3 Hens $5.00.
1 " " Cock and 3 Hens $5.00.
10 " " Utility Pullets 75c. each.
3 Buff Wyandotte Cockerels $1.50 each.
1 Columbian Wyaddotte Cockerel $1.50.
2 White Wyandotte Pullets $1.50 each.

ORCHARD HILL FARM
Brown's Flats, - N. B.

HOUDANS

The Favorite French Fowl

A breed combining beauty and usefulness. Prolific layers of large white eggs,—non-setters. A splendid table fowl with a wealth of firm, white breast meat.

Jan. 1, 1914.

W. J. M. MacLeod,
Sussex N. B.

Dear Sir:—The trio of Houdans I ordered from you arrived in good shape this morning. I am well pleased with them. I think they are very fine birds and am glad to know they are of such good stock.

D. McKAY, Pictou Co., N. S.

One Cockerel the progency of last years Boston and New York Winners, and one Pullet for sale.

$5.00 takes the pair.

W. J. M. MacLeod
SUSSEX, N. B.

SHORTHORN AND JERSEY BULLS FOR SALE

I have for sale five young pure bred and registered Shorhorn Bulls, 8 to 10 months old. These bulls will be suitable for service next spring and are from the best stock that can be imported.

Two pure bred Jersey bulls 1 1-2 and 3 years old respectively.

R. O'LEARY, - - RICHIBUCTO, N. B.

Milking Shorthorns

I have for sale 5 Registered Bulls ready for service. For fifteen years I have used bulls from the best milking families in Canada.

Write or telephone

Bliss M. Fawcett,
Sackville, N. B.

FOR SALE

A fine Dairy Shorthorn Registered Bull Calf 3 months old.

E. W HEURTLEY,
P. O. Sutherland's River, N. S.

FOR SALE

Two Jersey Bulls, twelve and thirteen months old, both from heavy milking dams. Apply to

ROBT. ROBINSON,
Meadow View Farm,
Box 265 Sussex, N. B.

Women's Institutes---Their Aims and Objects

The Late Honorable John Dryden regarded the organization of Woman's Institutes as the greatest work accomplished during his tenure of office and Honorable C. C. James characterizes Women's Institutes as one of the greatest achievements of the Twentieth Century

Usually when I address a meeting it takes me a few moments to decide whether there are enough men present to enable me to use the plural form and on one or two occasions I have been saved from the dire disgrace of saying "Ladies and Gentleman" by the presence of two or three small boys. However, things are slightly different tonight. Now I know the proper form of starting an address of any kind is to say something to this effect "It gives me great pleasure to have the honor of speaking to such an intelligent audience" etc. The audience is all that it should be and I admire it exceedingly but I must confess that my own feelings are decidedly mixed. I feel that the honor is almost too overpowering for one small person to carry off gracefully and as for the pleasure it is so mixed with trembblings that I can hardly tell you now whether you could recognize it as a pleasure or not. I shall be more competent to speak on that score when I finish. Public speaking is such a new thing to me that I cannot view it with that contempt that is bred of familiarity—in fact, if it was not for the fear of boring you I might use the overworked phase "Unaccustomed as I am to public speaking I come before you tonight filled with fear and trembling" but I will spare your feelings and just ask you to bear with me for a time while I tell you something of the latest work taken up by the Department of Agriculture namely—the work of Women's Institutes. As I already stated my audiences as a rule are principally made up of women and while we want to interest the women we also want to interest the men for in the end men are benefited by the Institute and they ought to know something about it.

HOW WOMEN'S INSTITUTES ORIGINATED.

Let me tell you then just how, when and where this organization came into being. It owes its existence to a group of women in Ontario who decided that the Government had been doing so much for farmers and the farms of the Province that it was just about time for them to give some consideration to the homes and the women of the Province. Information of all kinds was furnished free to the farmers, expert knowledge was given him on the proper scientific methods of improving his land and his stock, how to house and feed the latter in the most improved methods, but never a word of advice to his wife as to the best methods of providing for, housing and feeding the higher animals in the home. Not one word, the women were allowed to worry along in the old way. All for the men, nothing for the women and so even as the humble worm will turn if given provocation enough so will a woman. Why shouldn't she demand some assistance? I ask you who was doing the most important work of the Province, the man or the woman? Is feeding, housing and providing farm stock of more importance to the world than housing, feeding and improving humanity. Evidently it must have been so considered or the interests of the home would not have been so long overlooked. These few women decided that the time was ripe for the Department to do something along their lines and they requested that due consideration be given them in the duties devolving upon them as wives and farmers as mothers and homemakers. They urged that while the Department was doing fine work as far as educational work for the men of the Province was concerned nothing had been done for the women. Could the Department find something and if they could would they? The Department could and did, organizing a society distinct from the farmers associations and to be known as the Women's Institutes. Between you and me I have a suspicion that the Department thought it was only a fad and would probably die out in a year or two but in the meantime "anything to please and humor the ladies". If the Department had any idea of that kind it did not take them very long to find out that the women were very much in earnest. Judge for yourselves wnether it was a necessary thing or not for it grew beyond the hopes of the women themselves and very often the women may be depended upon to have a very clear and concise vision of the future. Fifteen years ago then, this society was brought into being and for the first year or two grew very slowly, then the women of Ontario alone realized its worth and during the past thirteen years its growth in Ontario alone has been most phenominal, as it boasts this year 800 Institutes with a membership of 25,000 an average growth of 50 Institutes per year. Last November at the annual convention they had an attendance of 700 delegates, and Ontario furnished them all.

HOW THE MOVEMENT HAS SPREAD.

From Ontario this movement spread through the Western Provinces to the Pacific coast, gaining in strength and in influence. Eastward into Quebec, into New Brunswick, this past year into Prince Edward Island and just this past summer into Nova Scotia. In Manitoba the Institute is known as the Home Economics Club and in Quebec as Women's Clubs, but they are the same thing and have the same aims and objects.

THE WORK IN NOVA SCOTIA.

Last summer we were only able to preach the gospel of the good to be derived from the Women's Institutes in parts of six counties and barely had seven weeks to do it in. We established fourteen institutes which I am glad to say are in a flourishing condition. While the short courses were being held the first of January at Truro we invited those Institutes to send in delegates to the first annual convention. Thirty enthusiastic delegates responded to the invitation and with that two of our societies were unable to send representatives. Now I am not prone to boast, it was absolutely the best convention I ever attended and I have been to a great many and all we women were most mightily pleased with ourselves, because the meetings were all good and decidedly worth while. Remember please, they are barely six months old and we held a successful annual convention. As the small boys say "Can you beat it" No, you can't. What do you think our convention will be five years from now? I am no prophet nor the daughter of one but I am quite willing to foretell several chapters on that subject and I think we will put this meeting to some trouble to keep up with us even if you have some years the start.

WHY IT GROWS.

Naturally the reason for its growth in any province is not far to seek. Its objects are those that interest a woman, for the home of a woman lies nearer to her heart than anything else. Primarily intended for the farmer's wife it has enlarged and taken into its fold every man's wife, mother, sister and sweetheart, because it appeals to every woman, not only of the rural districts but of the villages and the towns and in doing so produces a spirit of good fellowship and sociability and that is a side of the Institute that is not lightly to be thought of. If an Institute does nothing more than show to the women of a community what real friendship and neighborliness means it will have done a tremendous piece of work. Those are two things of which we can scarcely have too much of. Many people are of the opinion that the Institute is nothing but a cooking school where cooking is the chief thing discussed. Far from it. Was there ever a woman who would not prick up her ears when someone told her of the lovliest recipe as women are usually most anxious to procure a new recipe. I may add that there are few men that are not interested in the same thing, perhaps not just absorbed in the abstract receipt but are undoubtedly absorbed in the concrete result if it turns out a success and are usually very willing to give an opinion on the dish. Cooking is not the only thing discussed at the Institute but it is a necessary thing for good housekeeping, although not by any means the only thing.

Miss Jennie A Fraser
Superintendent of Women's Institute for Nova Scotia.

With Miss Fraser as a leader, we feel confident the women of Nova Scotia will co-operate with her "For Home and County" in all the phrase implies.

HOMEMAKING NOT HOUSEKEEPING.

Note that I say home-making, not housekeeping—they are

(Continued on page 352)

A Short Course in Agriculture at Woodstock, N.B.

Short Courses in Agriculture are not an entirely new thing for the farmers of New Brunswick, many of whom have attended the courses at Truro during the last few years. Those who have done so, and appreciate what a lot of useful work may be crowded into two or three weeks, will learn with satisfaction that they are now to be provided with similar opportunities at home.

The Department of Agriculture of New Brunswick is planning to open its new Agricultural School at Woodstock with a three weeks' course beginning March 9th. Its officials are now engaged in getting the necessary equipment for the work, and in the preparation of a thoroughly practical up-to-date programme. Arrangements are being made for a number of outside men, recognized as experts in their respective lines, to assist the men of the Department of Agriculture, and no effort is being spared to make the work interesting and profitable for those who attend.

Fisher Vocational School, Woodstock, N. B.

Where Short Courses in Agriculture will be conducted from March 9th to March 28th

The first week of the course will be devoted chiefly to horticulture, with special attention given to orcharding. Every aspect of this question, from the choosing of orchard sites to the marketing of the fruit, will be discussed as fully as time will permit. Practical demonstrations in planting, pruning, and grafting, and in the preparation of spraying materials, will be a feature of the work. Lectures illustrated with lantern slides will be another special feature.

Though most of the week will be spent in the study of apple growing, provision has been made for at least one or two periods to be given to the study of small fruits and vegetables.

In addition to the horticultural work it is intended to hold, during this first week a few lectures and demonstrations in bee-keeping.

During the second week the study of field crops will constitute the most important part of the program. Leading varieties of grains, grasses, clovers and alfalfas, potatoes, roots, and corn will be discussed from the standpoint of yield, and with regard to all other qualities which affect their economic importance. The students will be seated at tables upon which they can conveniently examine the samples of seed and other illustration material distributed to them as they come up for discussion. For the work in roots and potatoes we have been fortunate in securing the services of Mr. P. A. Boving, of Macdonald College, who is probably the best authority on root growing whom we have in Canada today.

Soil management in all its phases will also have an important place in the work of this week. Special attention will be given to the problems of drainage, fertilizing, crop rotations and control of weeds as they relate more particularly to this Province.

The third week of the course will be taken up with the study of live stock, dairying and poultry.

A comfortable live stock judging room is being fitted up, where good representatives of the leading breeds will be brought in for demonstration purposes. The judging work will be supplemented with lectures by qualified speakers on breeding, feeding, and management.

Four lectures in dairying have been arranged. The production and care of clean, wholesome milk and cream, milk-testing, and butter-making will all be discussed.

In the time devoted to poultry the practical problems relating to the care and management of the flock for winter egg production, as well as the selection of breeding stock and the rearing of chickens, will be carefully studied.

Evening sessions will be held on a few days of each week, and the programme of some of these, at least, will be of a popular nature. Subjects of general interest to farmers will be made special features of these evening meetings.

To encourage attendance from more distant parts of the Province the Government will, for this year, refund the cost of railway fare amounting to $2 or more to students from any part of New Brunswick who remain at Woodstock during the whole three weeks. Though students are encouraged to stay for the whole course, the programme has been so arranged that those who can afford to stay only one week can get some part of the work complete in that time. There are no fees or charges of any sort for the course. The only cost to students who have railway fare refunded will be their living expenses for the three weeks spent in Woodstock.

It should be remembered that the Department of Agriculture is going to a great deal of trouble and expense to make this course something really worth while, and any farmer or farmer's son who is anxious to increase his store of practical knowledge can hardly afford to miss the opportunity.—R. Newton, Director of Agricultural Schools.

Fertilizers--Their Nature and Use

Editor Maritime Farmer:—

There are a number of substances essential for the growth of plants which are grouped under the general term of "plant food." This term is taken to mean elements which the plant actually takes up from the soil or air and uses in its growth. Substances which may be applied to soil and so affect it that a better crop result can in some cases be used. It must be remembered, however, that these are not actual "plant foods" but, rather, are "stimulants."

Of the number of essential plant food elements the crop easily obtains from the air and from the soil all but three. These are Nitrogen, Phosphorus (Phosphoric Acid), Potassium (Potash.)

Soils are frequently deficient to some extent of these three; but as a rule are particularly lacking in one or two, depending upon the type of soil, and system of cropping and cultivation. The only really practical way of finding out the special soil requirements is by actual field experiments. Unless definite information is obtained as to these special requirements it is advisable to furnish all three plant food essentials, either in the form of barnyard manure or commercial fertilizers, or better still, a combination of both.

In stating that soils are deficient to a certain extent of the plant food substances mentioned, the word deficient is used advisably. To be of any benefit to the crop the plant food must be in solution, the fine rootlets having the power of taking up solids only when dissolved in the soil water. That being the case, an unlimited store of plant food substances in an insalible condition is of absolutely no value to the growing crop. As a matter of fact, most soils contain enough plant food to produce bumper crops for a number of years, providing that this plant food was easily available. Therefore, by stating that a soil is deficient in certain plant food essentials it is understood that the soil does not contain enough AVAILABLE plant food to meet the crop requirements.

These essential plant food elements each have their respective functions in the development of the plant. It is very important to note that one cannot be replaced by another, that the deficiency of one cannot be counteracted by the excess of another. The growth of the crop is controlled by the plant food in minimum.

NITROGEN.

Nitrogen affects more particularly the vegetative part of the plant, giving vigor and color to the foliage, materially influencing the size of stem and leaf. Its influence is, therefore, much more apparent to the casual observer than is that of the other two elements mentioned. An excess of nitrogeo, however, has serious injurious effects, such as retarding maturity, causing a sappy growth of stem or straw and reducing the set of fruit or grain. We have a concrete example of this in the case of a grain field which has received a rather heavy application of barnyard manure, thus being supplied with an excess of nitrogen. In such a case, a rank growing, weak-stemmed grain, susceptible to rust and liable to lodge is produced. With this is accompanied a low yield of grain of inferior quality.

PHOSPHORIC ASID

Phosphoric acid affects especially the reproductive parts of the crop, tending to increase the set of fruit and grain. Though this plant food does but little to increase the general growth of the plant it materially affects the quality causing a firmer growth and hastening maturity. The use of basic slag, a phosphatic fertilizer, on grain, gives us a concrete example. Usually, during the growing season, very little, if any, difference is seen in the grain which has had an application of basic slag. However, it matures several days earlier and gives increased yield of grain of superior quality.

POTASH.

Potash being essential in the formation of carbohydrates (starches, sugars, and fibre) affects both the vegetative and reproductive parts of the plant. Although affecting the general development of the crop it does not in any way cause the extreme growth which a too heavy application of nitrogen does. It influences more particularly the vigor and strength of stem and leaf, thereby tending to make the crop more resistant to disease. This is commonly observed in the case of grain. Where a sufficient supply of Potash is present a stronger straw, less liable to lodge and rust, and bearing a heavy grain of good quality is produced. Influencing the production of starches and sugars, potash is of special value in the production of fruit in increasing the yield and size and in improving the quality and color.

The value of lime, humus, and cultivation in impraving soil fertility might be mentioned. These factors are treated but briefly here, not because of lack af importance, but because of their being a little aside from the subject of this article. In fact, these factors, especially the latter two, are of the utmost importance in building and keeping up the productiveness of the soil.

THE VALUE OF LIME.

Lime is used primarily to counteract acidity in the soil. Such acidity is found in fairly light soils, as well as in the heavy and in the peat soils. The best quality of crops cannot be produced on sour or acid soils. The valuable crop of clover will not grow on sour soils. Lime is the antidote. Aside from counteracting acidity lime is indirectly beneficial through its action ou the chemical composition of the soil in rendering soluble plant food which otherwise would remain "locked up" for considerable time. It must be noted that lime does much to reduce the humus content of the soil. Thus the applying of lime frequently, without keeping up the humus or vegetable matter in the soil, soon results in conditions as bad, if not worse, than those existing when there is a lack of lime.

"Lime, and lime without manure,
Makes both farm and farmer poor."

The Apple Aphis and How to Control It

Address by Professor W. H. Britten, Truro, N. S. Before the N. S. F. A., at Bridgewater, N. S.

Before proceeding to the subject assigned to me, I would like to say a few words in regard to the campaign against the San Jase scale carried on by the Department of Agriculture during the past year. The report will soon be published and therefore I will only deal with the subject in a very general way.

Our inspection last year began early in June and continued until October and some fifty-seven trees were destroyed bearing the scale. Six of these trees were of 1911 planting and the remainder were 1912 and 1913 planting.

I do not wish to make any predictions in regard to this matter or to prophecy that we have wiped out this scale from the Province of Nova Scotia, but for it to be brought so nearly extermination in a country where it had gained such a foot hold, speaks well for Mr. Sanders who discovered this pest and conducted the campaign against it, for Mr. Matheson who continued the work and for Mr. Payne who increased it.

Other parts of the Dominion of Canada have this pest and still manage to make a living, but there is no doubt whatever that if we had this to contend with it would greatly increase the cost of our production. I do not wish to exaggerate the importance of this pest, and am very far from saying that its development would sound the death knell of our fruit industry, but I do say the low cost of production is one of your greatest assets, and so far as the Department of Etomology s concerned, we are going to spare no effort to keep it that way.

In regard to our future work with this pest, we are not going to drop it at this stage. We are going to continue it next year. All our efforts are being concentrated in keeping it out of the country altogether. We have a fumigation station at Digby and at Truro and are increasing our efforts in that way, so that all stock will be subjected to thorough fumigation. By these means we hope to keep the San Jose scale outside of our borders.

(Applause)

I think this same matter of the San Jose scale will give you some idea of the part that the Etomology Department plays in such a fruit country as this.

I may say that this is not the only problem that confronts us. We have the aphis and the apple maggot firmly established in this country.

I know it is customary with departments to give a lot of advance notices of what we intend to do about such things; I shall not indulge in anything of that sort on this occasion, but hope for an opportunity at this time next year to point to what has been accomplished during the year then past.

Now, coming to the subject which has been assigned to me, I hope you will not expect me to announce anything new on this subject. I believe before anything definite is given out, the whole matter should be carefully investigated under Nova Scotian conditions. I think we are all too apt to follow methods found effective in other countries, without taking into account our own local conditions. I tell you frankly that I would feel a great deal better in speaking on this subject if I had already done this in our own province. The scene of my labor with this pest is far removed from Nova Scotia. In these arid and semi-arid areas of the North West the aphis finds an ideal condition for its existence. I think in British Columbia, Oregon and Washington they are in a very much worse state than we are, but still many fruit growers no longer dread it.

I presume you are well acquainted with the life history of the orchard aphis. I will therefore confine my remarks largely to the methods used to kill it. But, to deal briefly with its life history.

The commonest and most destructive in this country is the green apple aphis, the rosy apple aphis, the green aphis and the wooly apple aphis. I presume you are mostly all acquainted with those small, black shiny oval eggs found on the trees in the winter months. Since coming here several have asked me regarding their appearance. Unfortunately I have brought no specimens with me, but if anyone wishes to become posted on their appearance, I can post samples to them as I can get all we need at Truro. Several members I see here had the opportunity at the short course of viewing these eggs in a small orchard there. These eggs hatch early in the spring and by the time the leaf buds are out practically all of them have emerged. I remember, last spring, going through an orchard before the snow was off the ground—there had been a number of warm days—and looking at the twigs very carefully we could already see some of them hatched. By the time the leaf buds are burst, practically all are hatched. This first generation of aphis are all wingless females. They become mature in two or three weeks and give birth to young ones without the intervention of the males. The second generation are winged females and fly to trees and rest there. Towards fall males and females are produced which pair in the ordinary way and the females lay their eggs on the trees in the ordinary way.

The rosy aphis is not common in this country. It goes for the fruit spurs; it goes for the fruit, causing it to become very badly gnarled. This aphis has a peculiar history. The first brood appears on the apples, and then departs to some unknown food and then reappears on the apple in the fall. The eggs are not as numerous as the green apple aphis, but they are laid on the twigs in the same way.

The green aphis appears here too. The first generation are on the apple and during the summer they breed on the grass and come back in the fall and!
and feed on the apple.

The wooly apple aphis I did not intend to sgy much about as I imagined it was not of great importance, but I have been assured that some people are troubled with this type of aphis. The wooly apple aphis differs considerably in its habits from the preceding species for whereas they are leaf feeders, the wooly apple aphis feeds on the tender tips and roots. In a good many cases this is the worst pest of all. In the spring you will find it clustered upon wounds in the bark or where you have cut off a shoot. Towards fall they move further out on the shoots to the terminal shoots. A great many open cankers will be produced in this way and in some cases small galls.

The next question is that of control. You have all noticed the ants which congregate round the aphis. The aphis secretes a sort of juice, called honey dew, and the ants come and feed on that honey dew. Some species of ants keep some species of aphis very much as we keep horses and cattle, for the sake of the honey dew. I remember I was once describing this apple aphis to a gentleman in British Columbia. He said I was wrong about the way I said the aphis spent the winter. He said, the ants took them into their nests in the winter and in the spring brought them back and put them on the apple trees. He was wrong about the apple aphis, but it is a fact that the corn aphis is kept by the ants in their nests during the winter, and actually start little tunnels for them to the corn roots in the spring.

I had another experience in Quebec I was going by a field and saw a man out there knocking something off the trees and crushing it between little sticks of wood. I climbed over the fence and asked him what he was doing. He said: ;"You see these little yellow ones here with the black spots on their wings, and these little green ones. These with the black spots on them are the mothers and these green ones are the little ones. I am killing the mothers." He was killing the lady birds which were eating the aphis eggs.

Now we will come to the most important question, that of control. The most valuable aphiscide of recent times is a preparation of nicotine called Black Leaf 40. I understand this preparation is handled here by the United Fruit Company. That is the best aphiscide and altnough it is not cheap, it is the most inexpensive to use at the present time.

In regard to the time to spray, if the aphis is hatching in large numbers, the black leaf added to the first spray is very effective; that is the first apple spray as recommended by Professor Caesar. It works very effectively with lime sulphur. Use one third of a pint to forty gallons of the lime sulphur. I think you can do better than that. Under ordinary circumstances, to the second scab spray just before the blossoms open, when they begin to show pink, at the tips, you can add the Black Leaf to that and get excellent results. There is no danger of using it too strong. If the spray is used thoroughly I do not think you will have any trouble whatever. Of course, you will understand that you have got to hit the aphis in order to kill it. You cannot prevent it by spraying, you have got to wait until it is on the trees.

There are two other sprays which I might mention, which are used for aphis. There is kerosene emulsion; if well made and properly applied it is just as good as Black Leaf 40. It has three disadvantages. It cannot be used safely and effectively with other fungicides and insecticides. By adding Black Leaf 40 to the lime sulphur, you get rid of one operation. In the second place, the cost is considerably higher. Thirdly, unless it is properly made there is great danger of burning the foliage. Therefore, I am very reluctant to recommend its general use.

There are a number of soaps—whale oil soap is good and there are other good soaps, but their cost is against them and there are other preparations which I do not mention as their cost is prohibitive.

Q. They do not get headway until the weather is warm?

A. No, they don't seem to. But there is one thing we must remember we have got to spray before the leaves are curled. You know how the aphis curls the leaves up. You cannot get at it at all if you wait until that time. The reason of much of our poor results is that the spraying is put off until this time.

Q. Can that last spray go on two or three days earlier than you have indicated, and do just as much good?

A. Just as much good. It just depends on when you are spraying for the scab.

Q. Would it be all right in Bordeaux?

A. I never used it in Bordeaux. Out where I was we never used anything but lime sulphur.

Q. Would it be very important to direct that spray so as to get to the under side of the leaves?

A. Yes. If you have a tree that is so thick headed that you cannot get the spray in on it, your efforts will be absolutely futile. I have seen some very high and overlapping trees here; I do not see how you are going to get at them.

Q. What pressure would you put on?

A. 150 to 175 pounds would be good.

I cannot close this address without saying something about lime sulphur for killing aphis eggs. A few years ago it was said that lime sulphur would absolutely kill aphis eggs. That is not true. It has been disproved all over this continent. Even if you defer the spray until the aphis are all hatched only a small proportion are killed. If you don't get all you may as well not spray at all. Lime Sulphur will not kill the aphis eggs, will not kill enough of them to make any appreciable difference. For That reason it is far better to use the Black Leaf 40 in connection with the aphis.

Q. How much frost will the aphis stand?

A. I have seen them get badly frozen two or three times after they are hatched.

Q. Do these remarks apply to aphis wherever they are found, for instance on rose trees?

A. Very largely the same.

Q. Why is it we will have years following a bad infection of aphis, when there are practically none?

A. Now, aphis are among the most susceptible insects to weather conditions as well as to the attacks of parasites. Every few years we will have a series of days unfavourable to the aphis, or the parasites will get ahead of them and absolutely clean them out.

Q. Can you control them on nursery stock by spraying?

A. Yes.

Q. Ca[illegible] it by dipping?

A. It is often found more convenient in nurseries than spraying.

Q. Would they appear again in ten days after you dipped them?

A. Yes, if you had not killed them all.

Q. If you don't find you control them with the two sprays you mention, would it be any use to continue the spray after the apple is formed?

A. Very little, but you will probably succeed before that.

Q. Are the eggs laid in bunches?

A. They are laid singly, but often very thick.

Q. Does the first spraying kill the parasites?

A. No, they are a biting insect and the aphis is a sucking insect.

Q. For farmers who are limited in means, time and help, which would you consider the best fungicide, lime sulphur or Bordeaux?

FROM LOW GRADE TO PURE BRED STOCK

Not every farmer who invests money in fine or blooded stock, succeds. The treatment and handling has a good deal to do with it. Some who handle and feed stock of common types, do quite, well, but if they possess much better blooded animals they get a poor development because of improper feeding and management. It is utterly useless to buy fine and high priced breeding stock, unless the best of care is taken to make each animal grow or produce to its best ability.

Growing scrub or low grade stock is not only a personal, but a national loss, because large quantities of food-stuff is consumed without a corresponding increase in the weight of the animals. A failure on the part of the producers to furnish the largest amouut of beef, mutton or pork for the amount of food consumed, is just so much lost to the country.

Those who are apparently unconcerned in the matter of breeding stock with an eye to its general improvment, and who by the use of the common breeds are making it pay fairly well, if they will adopt pure blooded stock, and manage and feed properly, can do vastly better than they are doing, without any additional work. Any man who possesses a farm and is out of debt should by all means purchase a few purebred animals to start with and breed from, and by securing such and attending to them in the right manner, it will not take him long to change his entire stock from common to improved breeds. The pleasure and increased profit resulting from so doing will more than repay him for all trouble and outlay.

First class or purebred male animals of any kind of farm stock are really not necessary to be purchased, by every farmer to start with, as several neighbors can join in buying these, and thus greatly lessen their cost to each, and still their benefit is secured. By perseverence and a desire to improve their stock, any neighborhood of farmers can easily do so and in time possess such breeds as will give the greatest satisfaction, and realize for their trouble such remuneration as cannot fall to be altogether satisfactory to every one.

SOCIAL CENTRES

It is not good to be alone. The saddest word in the English language is loneliness. The happiest place is home. The best thing in the world is love. People are glad when they get together—sad when they have to part. Union is strength and joy. The family, the church, the fraternity, the society, the city, the nation, all are the results of the universal desire for fellowship.

The bond of all true union is a common interest. People who like the same things like one another. Those who do the same things like to be together. A pleasure shared is a pleasure doubled. When children and parents stop working and playing together the home goes to pieces. When boys and girls go to school only because they are forced to do so, education is a failure.

It follows then that a good way to make people happy is to give them something of sufficient interest to draw them together in unselfish groups, and keep them together by keeping their interest alive. The higher and deeper the common interest which unites them, the grander is the society. The bond of the family is the bond of kindred. The broader the common interest the larger will be the society. The love of kindred is necessarily narrow, as the family is a comparatively small institution the love of humanity is large, and the church and school should be universal.

Hence, we can see the necessity of the social centre activity that has advanced with such leaps and bounds within the past few years. Every neighborhood should be so bound together. The school houses shoule be thrown wide open to all useful activities. Neighborhood socials, neighborhood classes, lectures and musicals should be encouraged. As a nation, we are forgetting how to be neighborly. What has become of the old-time singing school, spelling bees, quilting parties, and Debating Societies? All are relegated to the Land of the Used to Be. Neighborhood visiting has gone out of style, and with its going has departed much of the neighborhood spirit of helpfulness.

PARCEL POST IN OPERATION

The Parcel Post system, came into operation on the 10th, inst.

The zone system apparently is adopted. First there will be a zone embracing an area within a radius of twenty miles from any given place, and there will be seven major provincial zones, corresponding to the several provinces of the Dominion, except that the Maritime Provinces will jointly form one zone. Parcels up to a maximum weight of eleven pounds may be sent, and from the published rates we have made up the following table of the postage that would have to be paid on parcels of different weights according as they are destined for points (1) within the twenty-mile radius, (2) within the Maritime Provinees and (3) between a Maritime point and an Ontario point. The last named rate is of special interest, for it represents the rates an Ontario or Quebec mail-order house would have te pay on parcels mailed to customers in the Maritime Provinces.

Lbs.	20-Mile Radius	Maritime Provinces	Ont. Points to Maritime Provinces
1	5 cts.	10 cts.	12 cts.
2	6 "	14 "	20 "
3	7 "	18 "	28 "
4	8 "	22 "	36 "
5	10 "	26 "	44 "
6	12 "	30 "	52 "
7	14 "	34 "	60 "
8	16 "	38 "	68 "
9	18 "	42 "	76 "
10	20 "	46 "	84 "
11	22 "	50 "	92 "

It will thus be seen that while the local merchant mailing a parcel of maximum weight to a customer within the twenty-mile radius would have to pay only 22 cents, his provincial competitor outside that radius would have to pay 50 cents and the Ontario and Quebec stores, 92 cents. Thus the small merchant is afforded a considerable amount of protection, and it is hardly to be conceived that mail order competition from the big city stores will be very much more felt as a result of the new system.

We can see, though, how enterprising farmers might cut into the trade of retail dealers in towns and cities by establishing a connection with consumers there to supply articles like butter, eggs, chickens and so forth, In order to compete they would have to charge a price not much less than the regular price in the city or town but their net price would be less than the market price by the cost of postage and packing and labor involved in doing up such small parcels. But if the farmer were to be wise enough to do this business on a cash basis, he would find it pay him handsomely.

Now is the time for every progressive Maritime Province firm who wishes to do a direct trade with our farm homes, along mail order lines, to get busy, advertise and let the people know that they are alive and ready to cater to the trade which they so long bemoaned as going to other sources,

An advertisement in the Maritime Farmer will popularize your goods. Yes it will!

IMPORTANT EVENTS

Several important events will transpire in the Maritime Provinces during the next six weeks.

The New Brunswick Farmers and Dairymen's Association will meet in Fredericton on March 2nd to 6th inclusive.

The programme will be found on onother page of this issue. Plan to attend and take part in the discussion.

The Dairy School will open in Sussex on March 24th and will continue until April 4th. Cheese making, Butter Making, Soft or Fancy Cheese Making and Ice Cream Making will be the subjects taught. A Domestic Science short course will be held in Sussex from March 31st to April 3rd, inclusive. Competent demonstrators will be in charge. If you are at all interested it would be well for you to write to C. W. McDougall, Dairy Supt. for circulars.

A three weeks course in Agriculture will be given in Woodstock in the new agriculturist school, dating from March 9th. See full announcement on another page.

The Maritime Horse show will be held in Amherst N, S. on April 1st, 2nd, 3rd and 4th. If you wish to soe the best ideals in the various breeds that can be found in the Maritime Provinces you well find them at Amherst on the above dates.

The Agricultural Gazette of Canada.

With the coming of the New Year there has appeared in the field of Canadian journalism a new agricultural magazine which promises to serve a most useful purpose. At no time in the history of the world has the cause of agriculture been accorded the support it now receives from legislative bodies, and in no country has the industry been more wisely or generously helped than in Canada. The Dominion and Provincial governments exercise the utmost diligence and concern in their efforts to solve the problems that confront the farmer; to this work increased impetus has been given by the coming into force of the Agricultural Instruction Act, which serves as a medium for co-operative effort.

With a view to bringing together information concerning the work of the federal and provincial Departments of Agriculture there has been launched the publication of the Agricultural Gazette of Canada, the first number of which has just now made its appearance.

While this magazine is edited and published at Ottawa its value is greatly increased by the co-operation of the officials of the Provincial Departments. The January number is evidently preparatory for what is to follow, as it is devoted chiefly to accounts of the organization and development of the several departments of Agriculture in Canada and statements of appropriations by which they are enabled to carry on their work. It contains also the full text of the Agricultural Instruction Act, the agreement with each of the provinces and a statement of the appropriations under the Act for the present year and work made possible thereby.

In his "Foreword," the Honourable Martin Burrell, Minister of Agriculture, points out that the magazine is not to enter into general circulation, but is to supply the press and those engaged in official agricultural work with facts and information relating to the educational and scientific side of agriculture. To these it is supplied free. For others, a small additional number of copies will be printed from month to month for which ten cents per copy or one dollar per year will be charged.

The magazine, which is clothed in a dignified cover, presents a very attractive appearance, being printed on high class, coated paper, which does full credit to the photo engravings of the Dominion and Provincial Ministers of Agriculture that appears in the first number.

The Growing of Mangels.

Ten pounds of mangels or twelve and a half pounds of turnips equal one pound of corn in feed value. Each one of these things—that is, ten pounds of mangels, twelve and a half pounds of turnips, or one pound of corn—may be taken as a feed unit or standard of measurement in determining the feed value of different food products.

It was something in this sort of way that P. A. Boving, of Macdonald Agricultural College, began his talk on roots.

Then he proceeded to show how a crop of roots, on the basis of measurement stated, compares in food value with some other crops. (Round figures are used; fractions omitted.)

MANGELS DOUBLE ON CORN

A crop of mangels, yielding 21 tons to the acre, gives 6,200 feed units. A crop of White Cap Yellow Dent corn yielding a little less than 13 tons to the acre, gives 3,217 feed units. A crop of Banner Oats, yielding 1,905 lbs. of grain to the acre, 2,658 feed units. A crop of mixed hay, yielding 3,000 lbs. to the acre, 2,400 feed units.

Thus, a crop of mangels giving 31 tons to the acre, contains nearly double the food value of a 13-ton crop of corn, and well on to three times the value of a crop of mixed hay giving a ton and a half to the acre, or a crop of Banner oats giving well on to 60 bushels to the acre.

TOTAL YIELD AND DRY MATTER.

Mr. Boving also gave some striking comparisons between the relative yields and relative feeding value of different kinds of roots grown at the Macdonald Agricultural College Farm (Round figures are given here aga n.)

Taking an average of five years, the prize-winning Yellow Globe gave 37 tons.

Sugar Mangels gave 36¾ tons.
Perfection Red Mammoth, 33½ tons.
Giant Yellow Intermediate, 32½.

TURNIPS.

Imperial Green Globe, 32½ tons.
White Globe, 30½ tons.
Queen, 28¾ tons.
Hall's Westbury, 27¾ tons.

There was an even more striking difference in the dry matter content of the different crops than in the total yield of the same. While Giant Yellow Intermediate gave nearly 4½ tons less of total crop than Prize Winning Yellow Globe, the dry matter content of the former was 3,719 tons per acre as against 3,336 for the Globe. And Mr. Boving considered the amount of the dry matter content in the different varieties of the roots as determining the feed value of the same.

"What is the use," he said, "of hauling nearly 37 tons of one variety of mangels to the farm when by haul ing 32½ tons of another variety you can get a little more dry matter.

A good many authorities will, however, differ from Mr. Boving on this point. As a former farm manager at the O. A. C. once said. "The liquid in roots is not water; it is root juice."

The following table shows the total average yield for five years in the different varieties of mangels at Macdonald College Farm, and the dry matter in same:

Giant Yellow Intermediate...32.658 tons Yield per acre; 3.719 tons dry matter per acre.

Sugar Mangels, 36.784 tons yield per acre; 3.610 tons dry matter per ac.

Perfection Red Mammoth, 33.459 tons yield per acre, 3.412 tons dry matter per acre.

Prize Winning Yellow Globe, 36.913 tons yield per acre; 3.336 tons dry matter per acre.

ABOUT COMMERCIAL FERTILIZER

Mr. Boving, in dealing with fertilizers, said these would pay if intelligently used, but before using them in a wholesale way it would be well to experiment with small trial plots in order to see what one's own farm needs. At Macdonald Farm, mangels on land not fertilized yielded 17½ tons per acre. Where 50 lbs. Nitrate of Soda, 50 lbs. Sulphate Ammonia, 250 lbs. Acid Phosphate and 75 lbs. Muriate of Potash was applied, a yield of nearly 26½ tons was obtained.

SEED EARLY—SOW ON THE LEVEL.

In dealing with seeding, Mr. Boving was most emphatic on two points —date of seeding and manner of seeding.

"Always sow early," he said.

"And always, save where land is badly drained, sow on the level."

An average of experiments at Macdonald Farm gave 32 tons of mangels from seeding on the 8th of May, 26½ tons from seeding on the 22nd, and 16½ tons from seeding on the 6th of June.

He also strongly recommended the growing of seed at home. "I have" he said, "bought seed in all countries in which it could be bought, and not in one single case have I secured as good an article as I have grown myself. Twenty-five mangels will grow enough seed for an acre of land."

HARROWING AFTER SEEDING.

Mr. Boving created suprise when he spoke of harrowing root crops—harrowing crosswise with the rows and with a tilted tooth harrow or a special weeder. He has harrowed mangels three or four times after seeding and has even harrowed after the plants are up. But he seeds heavily —very heavily—15 to 16 lbs. per acre. In carrots, he depends on the harrow to do the thinning. Mangels he plants in rows 30 inches apart and leaves the plants eight inches apart in the row.

The New Peat Fertilizer.

W. B. Bottomley, Professor of Botany in King's College, London, has recently discovered a method of "speeding up" the nitrogen-fixing bacteria in ordinary soil so that greatly increased crops result. It is stated, moreover, that he has taken out a patent to cover this secret process and that he is prepared to send some of the material to purchasers on receipt of the remittance.

For more than a quarter of a century it has been known definitely that certain bacteria, mainly legume bacteria, are able to fix and render available for plants the nitrogen of the air. For this reason leguminous plants such as clovers, alfalfa, peas, vetches, etc., are valuable enrichers of the nitrogen-content of the soil and are important crops in a rotation. Prof. Bottomley's researches (so the report states) have resulted in the "discovery of a medium which, when saturated with the nitrogen-fixing organisms and added to ordinary soil, brings about nitrogen-fixation in a remarkable manner. This medium is obtained by treating peat with certain aerobic soil-bacteria which break down the peat, convert the insoluble "humic acid" into soluble "humates" and change the acid peat into a neutral mass. The humate-forming organisms, having done their work, are killed off by sterilization. Then this medium is inoculated with a mixed culture of nitrogen-fixing bacteria—Azotobacter chroococcum and Bacillus radicicola—and after a few days' incubation is ready for use. When ordinary soil is mixed with this inoculated peat there is a marked increase in the nitrogen content of the soil."

In addition to its value as a medium for the growth of nitrogen-fixing bacteria, the inoculated peat is said to possess remarkable manurial properties, whether mixed with soil or used as a top-dressing. Apparently the soil may be either watered with an extract of bacterized peat, or manured with prepared peat at the rate of 1 1-5 tons per acre. In an experiment at Eton School Garden, 1 1-5 tons per acre of prepared peat are reported to have given 41 per cent. more potatoes, 25 per cent more turnips, 28 per cent more carrots, and 38 per cent more onions than 80 tons per care of farmyard manure!

The advantages claimed for the bacterized peat method are (1) It adds active nitrogen-fixing organisms to the soil under suitable conditions for nitrogen-fixation. (2) It stimulates the activities of the nitrogen-fixers already in the soil. (3) It adds direct plant food to the soil, a large amount of the organic vegetable matter of the peat being rendered soluble in the processes of treatment. (4) It directly promotes the root development of plants. (5) It improves the mechanical condition of the soil.

Numerous enquiries have already been made as to the practical value of this new peat fertilizer. We have not yet experimented with it to determine if it can do all its discoverer claims for it, and in the meantime we shall keep ourselves in an observant attitude. It would indeed be a wonderful fertilizer if one ton of it contained more fertilizing power than 80 tons of barnyard manure. It is almost too good to be true. Moreover, under present methods of soil inoculation, each legume must have its appropriate bacterial organism present in the soil before it can make normal growth, but with this new peat fertilizer it is claimed that proper conditions are obtained for luxuriant growth of all kinds of plants.

Farm Labor.

The difficulty of getting competent help is one of the conditions which are driving many people from the farm who would under ordinary conditions, prefer farm life. This condition is, it seems to us, an indication that better things are in store for the farmers of the country.

While cheap labor may be employed in some industries where most labor is under supervision and where each laborer has only limited and definite things to do, only the ablest type of labor can be used to advantage on the ordinary farm, as it is practically out of the question on the farm to give very close supervision of labor. Such labor must be trusted alone with valuable animals and machines, it must possess considerable skill in their manipulation and care. Such labor must further possess an earnest desire to do efficient and careful work without being constantly under the supervision of some overseer or foreman.

We believe that comparatively high wages must be paid before a farm laborer of suitable quality can be secured. The present scale of wages for this labor is entirely inadequate in view of the demands made upon it in comparison with requirements in other industries. For example: A fireman on a railroad engine receives from $80 to $130 per month, while no greater skill is required to fire one of these engines than to feed and manage a good herd of stock. A street car conductor receives from $75 to $90 per month, and certainly no greater skill or ability is required for such work than to handle three or four horses and a self-binder. At present from $30 to $35 per month and board, or a total of from $45 to $50 per month, is considered very good wages for farm hands.

If the business of agriculture is to compete with other industries, then agriculture must pay as good wages for the same class of work as is paid by the other industries; and the people who use farm products must pay such a price for them as will enable a farm owner to compete in the open labor market.—A. D. Wilson, University Farm.

The man who clamps a nervous heifer into a hog-tight stanchion and backs up against her when he goes to milk the cow in the next alley has a head which is the nearest approach to a gourd of anything this side of the grave. We know a farmer who tried this one placid evening on a heifer whose nerves were as sensitive as a bald-headed proofreader in fly time, and when he got about halfway through milking, the heifer made a half wheel and kicked so many crevices in his wind reservoir that he couldn't say the blessing for a week without wheezing like a nanny goat with the asthma. The tighter you tie a heifer the more horsepower she develops in her left hinh leg.

HORTICULTURE.

The Apple Aphis and How to Control It.

(Continued from page 327)

A. I never tried them side by side in the Province of Nova Scotia, but I don't think you can make any comparison in that way. Bordeaux is known to be better for some things. In the North-West we have a canker that Bordeaux gives better results for, the black spot canker; gives better results for potato blight. If you use it for gooseberry mildew, it has no effect at all, but the lime sulphur has an almost perfect control. So both Bordeaux and lime sulphur have their place.

Speaking of the cost of the different sprays I have mentioned, I figure out that for this Province Black Leaf 40 cost about 50 cents for forty gallons. If you add a pound of soap it costs 55 cents; adding lime sulphur one to ten costs $1.35; that is the two together. Professor Ceasar recommended it one to fifteen and that would make it a little cheaper. Lime sulphate, Black Leaf 40 and lead arsenate cost about $1.00. Kerosene emulsion, the same amoune costs 80 cents. Whale oil soaps cost all the way from 60 cents to $1.20. So you will see that Black Leaf 10 is the cheapest we have so far. I may say that I am very hopeful that we are going to discover some spray that will be cheauer than anything we have now. We are going to have a series of exhaustive experiments dealing with the question of the cost of sprays.

Q. With the small amount of aphis that is in the Valley this year would you spray?

A. I would watch very carefully. Black Leaf 40 wil, not deteriorate by keeping; if you don't use it one year you can use it another year.

Now, there is only one more thing I was going to speak of and that is the wooly aphis. For it you will have to use the same spray only a little stronger and they can very efficiently be killed in the fall. But you must use a strong spray, because of the wax on the back of the aphis which sheds it.

Q. What about the roots of the trees; are they on the roots of the trees? I have seen them on the roots that are sticking out.

A. I don't think that is of much importance down here, but in British Columbia I have seen a whole orchard pulled up and ninety per cent. were affected.

Some Lessons Learned at the Annual Meeting of the Fruit Growers Association.

The recent Fruit Growers' Convention was particularly a spraying session, three-qusrters of the addresses dealing in some way with the control of orchard diseases, or of insect pests. Perhaps never in Canada, certainly never in Nova Scotia was the subject so well discussed in all its different phases and aspects, and as a result, never were we quite so well prepared to fight these pests as in the coming season.

While these addresses are still fresh in our memory, it might be well to review some of the principal points brought out by the speakers, and see where their advice differs from the practices of the past.

All evidence seems to point to the conclusion that the early spray known as the dormant spray, is of little or no benefit except to kill oyster-shell bark louse. Prof. Caesar recommended that in place of this, the first spray be deferred until the leaf-buds are unfolding, and the little leaves about the size of a ten cent piece. The spores of the black spot are then just beginning to be thrown off from the dead leaves on the ground, and if the first spraying is defered until the usual time, or just before the blossoms open, it will be too late to prevent infection when there is much cold wet weather such as we had last season.

That this conclusion is correct is proved by the experience of Prof. Blair in the experiments in Falmouth, when the plots that did not receive this early spray had twenty per cent more spotted apples than the one that did. In fact this last season this early spray on about May 10th seems to have been by far the most important of the lot, Prof. Blair getting practically clean fruit or only three per cent. spotted on the plot that was sprayed May 9th, May 20th, June 11th and July 14th, while the plot sprayed only once before the blossams opened on May 20, and twice after, as the first plot, had twenty per cent of spotted apples. In this experiment it is also interesting to note that on the plots where no spraying was done before the blossoms opened, and only those on June 11th and July 14th applied, practically no benefit was received as far as the control of black spot was concerned, eighty three per cent of the apples being affected against eighty seven per cent where no spray was applied.

The addresses of Prof. Brittain on the green apple Aphis, and of Mr. Geo. Sanders on the Bud-moth were nearly as important to our fruit growers as those of Prof. Caesar on the Black Spot. Next to the Black Spot the Aphis and the Bud-moth rob us of more money than all the remaining pests taken together. Certainly no one should despise the power of little things, after seeing the millions and millions of aphis that covered every leaf and fruit of some of our orchards last summer. The great danger from the aphis comes in its enormous power of reproduction, so it is necessary to kill them as soon as they hatch in the spring, for if they once get well started, no spray can reach them where they feed in the curled up leaves.

Until the last year or two no one seemed to know definitely when to apply the poison to kill the bud-moth. Mr. Sanders in his experiments near Kentville found that the dormant spray was of little or no benefit, although we hgve been taught for years back that this was the one important. He got the best results from a spray applied about five days before the blossoms opened, but said equally good results would be got in the two sprays before the opening of the blossoms buds as recommended by Prof. Caesar for black spot. The aphis get their food by sucking the sap from the leaves through a kind of beak or tube, and can only be killed by a contact poison. Fortunately there is a preparation of nicotine called "Black-leaf Forty" that Prof. Brittain recommends to add to the lime sulphur in the spray that is applied just before the blossoms open. This Black-leaf Forty is quite expensive, and should not be added unless the little aphis can be seen on the small leaves and tips of the branches, for unlike blacl spot, it is no use to spray to prevent aphis, it is only passible to kill them after tne pest is present. Prof. Britten added that very few aphis eggs could be found on the trees in the Valley th s winter, and so it is possible they will not be in evidence next summer.

Summing up the recommendations of the three addresses on Black spot, Aphis and Bud-moth, we find we can beat the old saw of killing two birds with one stone, in that we can kill two bugs and one fungus with one spray, viz., lime-sulphur (for black spot) lead arsenate (for bud-moth) and black-leaf forty (for aphis) all applied in the same spray. Lime Sulphur and lead arsenate applied just as the leaf buds are opening, and the leaves the size of a ten cent piece for black spot and bud-moth, and lime sulphur, lead arsenate, and black-leaf forty applied just before the blossoms burst for black spot, bud-moth and aphis. Incidentally these two sprays will also kill all canker worms, caterpillars, and brown tail moth that hatch at this time.

The spray immediately after the blossoms fall was most important for the codling moth, and also got a good many of the bud-moth that escaped the other two sprays, and of course still further protected the little apples from the black spot. Any further applications according to Prof. Caesar, should be governed by the weather. Any long spell of cold rainy weather up to the middle of August would be likely to cause a new crop of spores to develop,

After listening to the addresses of J. M. Robinson on the results of the experiments carried on by the station of Kentville at Falmouth, Berwick, and Bridgetown last summer, the old controversy on which was the better spray, lime-sulphur or bordeaux, seems pretty well settled. Lime-sulphur gave just as good results as bordeaux as far as black spot was concerned, and did not russet the fruit. More No. ones in every case wer produced where lime-sulphur was the spray used, and after everything is said and done that is what we are after. Prof. Caesar made light of the idea that just as good results could not be got from the home boiled lime-sulphur as from the commercial. and said that any fruit grower could prepare his concentrated mixture with little trouble, and at about half the expense of the commercial.

Full directions on how to prepare this home boiled lime-sulphur are given in Bulletin 198 published by the Ontario Department of Agriculture at Toronto. It will be sent free to any fruit grower applying for it.

The experiences of some of our local men who were successful in growing a good crop of clean apples last year were carefully listened to, the paper of Mr. Leslie Wiltshire being especially interesting. Mr. Wiltshire applied his first spray at the time recommended by Prof. Caesar, or about May 10th, but did not spray again until the blossoms fell; still he had clean apples and a good crop on all but two rows of Ribstons that did not get the first spray: these two rows had no fruit, and the point brought out here cannot be too strongly emphasized, that spraying before the blossoms open not only means better apples, but it also means more apples, and that not only in the year in which the spray is applied, but also in the following year too, because the foliage, protected from disease is better able to perform its function of storing up plant food to make strong healthy fruit buds.

Mr. Wiltshire's method of fertilization should also be noted. He uses four or five hundred pounds of basic slag to the acre each year, and depends on a cover crop for the rest of his plant food. Only a few years ago many believed that a farm should have three acres of dyke to one acre of orchard, and that no more trees should be raised than could be fed with barnyard manure. Happily our Berwick friends have taught us that this is not the case, and many have gone to the other extreme, and like bringing coals to Newcastle, have bought large quantities of commercial fertilizers, when all the plant food necessary to grow apples for a hundred years lies dormant in their own soil, only needing a little lime and brains to render it available.

Many of our fruit growers seem slow to appreciate the great superiority of slag over acid phosphate as a source of phosphoric acid for our orchards. The cover crop is either vetches or clover, the vetches especially giving a large amount of vegetable matter to plow down in the fall, and it is alsa a good nitrogen gatherer. These clovers, however, do not do well in an acid soil, and after turning under several rank crops of green manures, the land often be-

comes too sour for the clover bacteria. This is where the Basic Slag comes in, being from fifty to seventy per cent lime, it not only corrects the acidity caused by the green manures, and makes the clovers grow more vigorously, but it adds its full cash value in phosphoric acid to the soil.

The cover crop draws up large quantities of potash from the subsoil, and renders it available for the trees the following summer. So by following the practice of Mr. Wiltshire, and using cultivation, slag and vetches, the same or better results will be obtained as by buying the different plant foods in a commercial form, and at one tenth the cost.

The annual report of the Fruit Growers Association will be ready for distribution in April. It will contain all the addresses of the different speakers, and the discussions upon them. It should be in the library of every fruit-grower as a book of reference. All annual members are entitled to this report, and to the Maritime Farmer for one year free of charge. Any one may become a member of the Association by paying one dollar to the Secretary. Address, Port Williams, N. S.—M. K. E.

Keep More Bees.

Editor Maritime Farmer:

It is surprising to go around the country and see how few farmers keep bees.

There seems to be a general fear of getting stung—but with careful handling and good judgment no one need get stung.

Every farmer or gardener should keep two or more hives and supply his own family with one of the most delicious and wholesome sweets the earth produces.

There are tons of honey going to waste in New Brunswick yearly, for want of bees to gather it. Even if you do see a hive or two of bees kept it is usually in the old style of box hives that are half a century behind the times. Now the object of this article is to try and induce some of the readers of your paper to start keeping bees.

Commence on a small scale and the outlay will not be heavy. I think the best thing to do is this winter, (today), send for a good book on bee-keeping, and I know of nothing better than The A. B. C. on Bee-Keeping by A. I. Root, Medina, Ohio, or it can be procured from any dealer in bee-keeping supplies. Study it well this winter—read it all over and then over again. Then next spring get one or two hives of bees..

If I were going to start bee-keeping I would buy two or more swarms of bees in box hives and transfer them to movable comb hives—but it is a hard to get one just starting in to undertake to transfer them, and I will admit it is quite an undertaking and it requires some courage, but it can be done, if a person will work cgrefully and according to instructions. But if you don't feel like undertaking it, but one or two, I would advise two, hives of bees in a good movable comb hive, from a reliable dealer, and set them somewhere near the house—according to instructions in book. Now what you need will be as follows:

2 hives bees about	...$14.00
2 employ hives	5.00
1 Smoker	1.00

There are a number of other things you will need but the above will do for a start. Of course, if you only get one swarm to start with, the cost will be less. Another way is to get one or two swarms of bees in the old box hives, which can often be got for a small price and have an empty good hive to put your first swarm into. In this way a start can be made for a very small outlay. After they have swarmed you can transfer them into movable comb hives.

Whatever you do get a standard hive; don't go making your own hive unless you make them a standard size There is no better size than the Langstroth and nearly all dealers keep stock for that hive. Sometimes a man will start and make a size of his own and then if ever he wants to buy supplies he can't get them. If you should decide to make your own hives, and it can be done if you have the time, get right dimensions, as you better get a sample high from some dealer and be careful not to vary ⅛ of an inch and then your frames and fittings will all fit in any hive.

I have said nothing about surplus arrangement. When the beginners start he better get 1½ story hives for comb honey, and ¾ story supers for the hives the bees are in. Now, with a fair season, he should have suppose you start with two, 4 hives of bees in the fall, and 50 to 100 lbs. of comb honey. If the season should be unfavorable you might not have much surplus, but don't be discouraged, but expect to do better next year. Always remember you will have a lot of experience and pleasure.

Now, as regards being stung, there is no more danger than handling a cross horse, and not near as bad as a kick or bite from a horse.—S. G. Eccles, Carter's Point, Kings Co., N. B.

Fine Maple Sugar and Syrup.

In the days of crude sugar bush methods there was little opportunity of learning the difference between the inferior dark products and those of fine quality, but now consumers are learning to appreciate the excellence of superior goods and to accept no other so long as these are available. This appreciation is leading to better returns for those who produce the light color, fine flavored sugar and syrup.

The up-to-date sugar maker recognizes that sap, like milk, is a very perishable product, being an excellent medium for the development of fermentative organisms. ...To make a fine sugar or syrup it is necessary, therefore, for the maker to have an equipment which will allow for the least possible contamination of the product in all stages of manufacture. Not only must thorough cleanliness be observed but transformation of the sap to the finished product must be direct and speedy.

Bulletin No. 2B "Maple Sugar" issued a few months ago by the Department of Agriculture at Ottawa deals fully with this subject and is therefore useful to the consumer in making clear what constitutes fine products and to the producer in showing how such goods are made.

DAIRYING.

Official Holstein-Freisian Record.

In the official list of seven day records accepted by the Holstein-Friesian Association from January 16th to January 31st, 1414, we find the following Maritime cows:

MATURE CLASS—Maple Grove Pattie, 9925, age 6 years-2 months-14 days, lbs. milk, 557.3; 26.07 lbs. fat the equivalent of 32.59 lbs. of butter 80 per cent. fat. Owner, Logan Bros. Amherst Point.

Piet 6th, 11578. Age, 12 years-8 months-16 days; lbs. milk, 438; 17.93 lbs. fat the equivalent of 22.42 lbs. butter 80 per cent. fat. Owner, Logan Bros.

Emma of Evergreen 2nd, 10645. Age 5 years-8 months-16 days; lbs. milk, 496.8; lbs. fat 16.17; lbs. butter, 80 per cent fat, 20.21. Owner, N. S. A. C., Truro, N. S.

JUNIOR THREE YEAR OLD CLASS—Homestead Piet Vale, 16645. Age, 3 years-3 months-12 days; lbs. milk, 323.4; lbs. fat, 14.83; lbs. butter, 80 per cent. fat, 18.54 lbs. Owner, Logan Bros.

TWO YEAR OLD CLASS.—Homestead Johanna, 13659. Age, 2 years-8 days; lbs. milk, 310.8; lbs. fat, 14.70; lbs. butter, 80 per cent. fat, 18.37. Owner, Logan Bros.

Watering Cows.

More cows fail to give a maximum yield of milk from lack of water than from lack of food. At least 85 per cent. of milk is water, and a cow that gives 58 pounds of milk a day must have at least 43 pounds (about six gallons) of water to put into the milk pail besides that needed for use in her system.

Just think of the foolishness of turning her into zero cold to drink two full pails of ice water and then expecting her to do her best in filling the milk pail. Would it not be wise to have water before her at stable temperature to drink at pleasure? Think it over.

"A merciful man is merciful to his cows." Is there any mercy in turning a cow out into a zero temperature, or below, and compelling her to drink ice water? Did you ever stand and see that poor cow shiver and shake in the stable while warming up that ice water to the temperature of her body? Don't you know that no cow ever made a drop of milk when shivering? Wouldn't it be wiser, as well as more humane, to provide that cow with water before her at stable temperature?

Think about it.—J. S. Woodward in Maine Farmer.

Is a Dairy Cow a Machine?

Public speakers and writers on dairy topics have said over and over and over again that the dairy cow is a machine. It is easy to see how such a comparison has been made; but it is good? Is the dairy cow a machine?

This is a machine age. It has been the practice in the past in large industrial plants to consider the laborers as so many machines. This attitude of mind has been responsible for many of the misunderstandings between labor and capital. It left out of account all human instincts and attributes. The modern idea is that the laborer is a human being and as such has the same characteristics of body, mind, and soul as they who employ him, and that he does his best work when these human qualities are appealed to rather than when he is driven at high speed as a machine.

Some time ago we visited a large and prosperous dairy and while there met a gentleman who had been making a close study of the modern conception of humane factory management. He was familiar with the efficiency studies and speeding up processes employed in many industrial plants and had noted the increasing results obtained where men were made comfortable in mind and body as they worked.

After spending considerable time in the barns watching operations, he said to the manager: "These cows are not machines as you have called them, they are poor, ignorant laborers and your milkers are the foremen. These cows have animal sensibilities that must be appealed to in order to get the best work from them. They must be treated as living beings capable of physical sensations and appreciation of contentment. They must like their boss, must have confidence in him and they will do their best."

We have pondered over this statement a good depl. There is nothing new in it. It is an old truth understood by every successful dairyman, but it is an old truth stated in new terms. He went on to state that he could see that every cow had her own peculiarities which the milker must recognize. He must cultivate her acquaintance io order to take advantage of these cow personalities just as the modern successful shop foreman must know the individuality of his men. This takes her out of the machine classification and endows her with an individuality which may be trained, cultivated, and directed to greater efficiency.

We are largely creatures of habit. Someone, sometime, said a cow was a machine; then someone else repeated it, and we may go on saying a cow is a machine. We do not stop to analyze the facts. In this way we make loose statements and continue their use indefinitely. Who shall say that our habits of thought are not influenced by these things. Statements which are perfectly understood by the writer or speaker are not always so understood by the reader or hearer.

If the cow is not a machine, and we do not think of her as such, why continue to call her a machine? Why not use terms that will convey the whole meaning—why not let the expression of our thought correspond with the thought? We would make greater progress if we did.

No! The cow has none of the inanimate qualities of the machine. Her only resemblance to the machine is the visible fact that we put feed in at one end and take milk out at the other. The whole process of elaboration of milk is animal and material, not mechanical. The laws of chemistry, physiology, and biology controlled by the animal and material instincts apply, not the laws of mechanics.—Hoard's Dairyman.

Canadian Jersey Cattle Club in Session

The 14th annual meeting of the Canadian Jersey Cattle Club was held in Toronto on Wednesday, February 4th. All the Officers of the Club were present with the exception of David Duncan who is, we regret to say in a very serious condition as regards his health, and Duncan O. Bull who is at present on a trip to England, the Island of Jersey and the Continent. It was the largest and most enthusiastic meeting our Club has ever held.

The proposed scale of fees was adopted. A committee of Bartley A. Bull and H. A. Dolson was appointed to make enquiries and act in any cases reported of sellers being slow at furnishing papers to customers, and for fraudulent papers, should any such arise which we are glad to say have not as yet. It was called to the attention of the meeting that some persons had been circulating reports that Jerseys were subject to bovine tuberculosis. This report was emphatically denied, many figures being quoted to show that it was absolutely wrong and officwers of the Club who had done much to have the report contradicted were commended, and asked to continue the good work. The members of the Club were urged by the Secretary to secure a tattoo outfit, and tattoo all their calves within a week of birth. Then to immediately make application for registration for the calves, putting made with the Accountant of the Live Stock Records at Ottawa that he will print this tattoo number on the registration certificate. The Secretary explained to the meeting the negotiations pending between him their private tattoo number on the application. Arrangements have been

and the committee of the American Jersey Cattle Club regarding reciprocal relations. The proposed plans were endorsed by the Club almost as they stand. A step was taken to endeavor to bring more stringent legislation to bear on parties who allow bulls to run at large. It being pointed out to the meeting the great damages which had been caused by unregistered bulls and pedigree bulls of other breeds. A committee was appointed to interview the Minister of Agriculture of Ontario to have this legislation come into effect.

It was proposed by some to shorten the time of the Record of Performance from 365 to 300 days, and the period allowed between the calving at commencement of rest and calving after the test from fifteen months to 400 days. This was rejected by the meeting, but as our regulation now stands, a cow must have had a calf within fifteen months before freshening at the commencement of test. It is recommended that this time limit be eliminated.

At the annual meeting a year ago, a committee was appointed to look into the butter fat standard of milk supplied to the City of Toronto. This committee interviewed the health authorities, and found the standard was only three percent. They reported this to the Secretary, who then took up the matter, and got the opinions of forty dairy experts and the standards of at least fifty cities on this continent, and went to the Aldermen of Toronto and had the standard raised from 3 to 3.25 percent. butter fat.

A committee of Mr. Green, Mr. E. H. Duncan and the Secretary was appointed to distribute a grant of five hundred dollars among the fall exhibitions. Another committee was appointed to interview the Canadian National Exhibition board to make a separate class for Canadian bred cattle. Two prizes in each of the four classes on the Record of Performance are to be given this year the same as last year, one for the cows making the highest number of pounds milk in the year, the other for the one making the highest number of pounds butter fat in the year. Fifty dollars was set aside to purchase a silver challenge trophy to become the property of any breeder winning it three times, and the cow making the highest record in each year holding it for that year.

The Club was unanimous in endorsing the new National Live Stock, Dairy and Horticultural Show held last November.

A letter from our good old friend "Uncle" David Duncan was read by the Secretary in which Mr. Duncan resigned from the Presidency of the Club. A resolution was passed to be forwarded to Mr. Duncan, explaining how the Club regretted the illness which caused him to resign, but that he had the heartfelt sympathy of the Club at its Annual Meeting. In the election of officers which followed, Mr. E. H. Duncan moved, and Mr. Beatty seconded that Mr. S. J. Lyons who had been on the Directorate for a long time, and has attended all our executive meetings with the exception of two, for several years, be President, and that Mr. D. O. Bull be First Vice-President and F. L. Green second Vice-President with the Board of Directors as follows: R. J. Fleming, Bartley A. Bull, H. A. Dolson, E. H. Duncan, Professor Archibald, and W. H. McEachren, and Bartley A. Bull was appointed permanent Secretary.

The Annual statement showed 1155 registrations and 575 transfers. This being an increase over 850 registrations and 321 transfers in the previous year.

B. A. BULL,
Secretary.

INTERNATIONAL STOCK FOOD

The Greatest Horse Tonic In The World

Winter is the time the horses need International Stock Food three times a day.

They are barned up, don't get exercise or green feed as in summer—and they must have a tonic like International Stock Food to help digestion, regulate the bowels, keep the blood clean and circulation active, and bring them through the cold weather in prime condition for spring work. 102

If you will write and tell us how many head of stock you own, we will forward to you free our $3,000. Stock Book.

SHARPLES MILKER

Easy to Clean

Easy to Keep Clean

"They are easy to take care of," writes one SHARPLES MILKER user, whose name we will be glad to furnish on request. "When we get through milking we milk a pail of water through them, the machine is cleansed in water about scalding, then placed in a solution of lime water.

"The machines do not hurt the cows. We have used them eighteen months. To anyone in the dairy business I would recommend them. We are milking around seventy cows daily in an hour and ten minutes. We use five units.

"One man attends to the milkers and another man strips the cows. The cows like it better than hand milking and it does away with the labor problem. I had to keep eight and nine men on my farm, but after pay day we might have one or two to do the milking. It just made things hum for the foreman and one or two men that would be regularly on the job. Now we are under no obligations to them. Everything works smoothly and there is no friction among the men picking out the easy milkers and all those stunts."

The SHARPLES MILKER now is being used in dairies of from 15 to 700 cows. Built sturdily, its operation is absolutely reliable.

Ask the editor of any national authoritative dairying paper what *he* thinks of the SHARPLES MILKER.

Catalog on request.

LIVE STOCK.

The Profitable Hog.

Editor The Maritime Farmer:—

At the price obtainable for hogs during the past year there is good money in raising all the pigs one can properly attend. The trouble with most of us is that when the price of any farm commodity goes up we are all apt to jump into a bigger proposition than we can properly carry out. It is easy to get in and out of hog-raising and the great variation in the price of hog products is sufficient proof that many of us are only following the wake of the market, get nicely started when everybody is at it and drops it as quickly, when the depression comes, only to find ourselves with little to sell when the market prices again soar.

A few years ago several of our Canadian farm journals gave considerable space to a discussion on the cause of the great fluctuation in hog prices. Nearly everybody (excepting the packers), blamed the packers for the trouble and while these pork packing companies could probably do more than they have been doing to try and equalize the prices, I could never see how they could be held responsible for the extreme variation in hog prices from month to month.

Prices of most commodities are fixed by the law of "supply and demand." The hog being a class of animal that depreciates rapidly in value, after a certain age, and having to be confined and fed largely on concentrated feeds is not a suitable nar profitable animal to hold over during a glutted market season. More over, a large majority of the hogs, in this country at least, are Spring farrowed and come on the market, of necessity, at a season of the year when most of the poultry are marketed, and until farmers regulate the supply to better advantage there will always be a slump in prices except in years of light supply.

From my own experience I would say we can afford to take a much smaller price for summer, than winter raised hogs. Any farmer can raise Summer hogs with a fair measure of success, but it takes an experienced and careful hand to make any money out of raising them in winter.

Regardless of all we read about a pig being able to stand cold, and the dry feed and the dropped feed, and any other method, with or without skimmilk, I find a hog grows might slow in a cold pen, and from my observations at the attempts at hog raising on P. E. I., during the winter months, I think pork needs to be at least 30 per cent. higher in winter to pay for the disadvantage of the season. Not that I don't believe hogs can be raised in winter at a profit, but we see such numbers of cripples, runts and deformed animals resulting from the attempts that I think somebody needs to make plenty to even up.

Hogs must have dry, warm quarters, particularly dry, in cold weather and on account of the nature of the animal, the matter of keeping him properly bedded all the time is a trying problem. It is hard to get enough bedding on any farm, particularly where dairying is followed.

Before the advent of co-operative dairying in this province, few hogs were raised in winter, and seldom would a sow be carried over one year. At that time we always kept a young sow every year; the old one, after raising only one spring litter, was fattened and sold in the fall, and we used to raise good, heavy hogs, for the age, too.

But of late, nearly every one in the business, keeps a brood sow, for three years at least, if a good mother and raises fall, as well as spring litters. While an old sow may raise larger and stronger young than a yearling, I could never see much advantage in this regard. A young mother will not usually destroy so many little ones. I don't know whether aged sows grow deaf or lazy or both, but they seem to care very little whether they hear a youngster squealing under them or not. I think the trouble must be that we have grown sows much heavier than nature intended them. They seem too big for the size of their young to keep from accidentally destroying a big per cent, of them. Many sows grow too awkward and lazy to deserve being kept as breeders, yet many others are not given a decent chance to save their litters.

Under natural conditions, a sow builds herself a bed in which to give birth to her young. Some of us in our wisdom think we can show the sow a wrinkle in this and take it from her, with the idea that she will smother her offspring. I have, many a time, watched sows have litters of all numbers from 3 to 22 pigs at a time, and I find that it is better to give the sow plenty of straw and leave her alone. Nature teaches her to build a barricade completely around her and when a little one is born he can't get away from her. In fact he can get nowhere but in front of her and is kept close against her warm body, where he soon dries off and gains strength. A sow left alone under these circumstances will seldom ever get up for hours after her litter is born, but I have seen them, left with only a little chaff or hay-seed, get up and root around after every pig came, and they seem to miss their natural bed and are restless and if an attendant is not at hand, or the weather is cold, many of the little ones get chilled before they ever suckle their dam. While I like to be handy when any of my stock are having young, yet I never interfere until I am positive something is not right. Much trouble and loss are often occasioned by ignorant interference, at the birth of all classes of farm stock.

If a sow has been praperly fed durthem deliberately killing and eating ing pregnancy, there is little fear of their young. I never had a sow do so. One should give the sow, as near as possible, the treatment she would have under natural conhitions, and there is not much danger of a you sow hurting her litter, and she is always more careful not to lie on any of them.

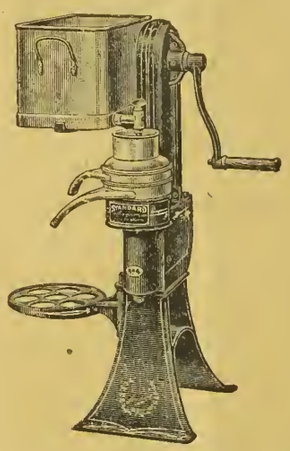
For the first twenty-four hours, a sow needs little but a warm drink. Heavy feeding at this time is dangerous. I know of a sow being killed by a big drink of milk from the separatar the day she littered. She should however, be generously fed as soon as it is safe to increase her feed. Few, very few men, seem to realize how much a sow needs and will eat of suitable feed, when sucklinh a good litter. Young pigs will average about three-fourths of a pound gain per day, if their mother is properly fed, and with a litter of ten to twelve pigs, we must furnish enough feed to produce six or eight pounds of pork. This will mean considerable feed, much more than the average sow will receive, but if we wish to make the most profit out of the litter we must feed all the sow will clean up of good milk-producing food.

I always boil food for a brood sow, and in winter, for the feeding hogs, whether or not boiling increases the feed value of grain and roots, it certainly adds to its palatibility. I always find pigs grow much faster and I think the shorter time we take getting them up to selling weight, the better.

I like to leave the litter on the sow six or eight weeks in the spring. They are then eating well with her,

Hear What Others Say About the Standard

Following are some extracts taken from letters received from owners of Standard Cream Separators. They show what others think of the Standard:



"Its skimming by our repeated tests is perfect."

"I think it is the easiest machine I ever turned and very easily washed, and I don't think there is a separator that can skim as clean taking it all round."

"No back straining to put in the milk and no dirty oil smeared around the machine all the time."

"It has the best oiling device I have ever seen."

"I find it a very close skimmer with the milk in any condition, and that it will deliver any density of cream with either warm or cold milk, and still flush out easily."

The letters from which the above extracts are taken are printed in full in our booklet. Send for a copy. It is interesting, instructive, and fully describes "The World's Greatest Separator," the Standard.

A SOIL ROBBER

He is a SO-CALLED FARMER, who has cropped and cropped, year after year, without returning a pound of plant food to the soil to replace the many hundreds he has sold off the farm. His soil has become so barren that nothing will grow decently but weeds, and these flourish indecently. SUCH A FARMER IS A MENACE TO THE COMMUNITY AND A BLOT ON HIS CLASS.

Many other farmers are trying to maintain the fertility of their farms on a limited supply of manure and find their soils becoming poorer. Every crop removes varying quantities of Nitrogen, Phosphoric Acid and POTASH from the soil. If fertility is to be maintained these must be returned, in some form, to the soil. This can be done by the use of ARTIFICIAL FERTILIZERS and by so doing a farmer will not only maintain the fertility of his soil, but greatly increase his crop production.

POTASH is an essential plant food and no soil that does not contain a readily available supply will raise a maximum crop.

MURIATE OF POTASH and SULPHATE OF POTASH can be obtained from the leading fertilizer dealers and seedsmen. WRITE for FREE copies of our educative bulletins, which contain the results of fertilizer experiments. These include:

"Artificial Fertilizers; Their Nature and Use."
"The Principal Potash Crops of Canada."
"Fertilizing Grain and Grasses."
'Fertilizing Orchard and Garden."
"The Potato Crop in Canada."
"Farmer's Companion, etc."
State which you require.

GERMAN POTASH SYNDICATE, 1102b Temple Bldg., Toronto, Ont.

Deserved Compliment Not Witheld.

A gentleman from Scotland who has travelled extensively, and who recently had occasion to use the Canadian Government line—Intercolonial Railway—between Halifax and Montreal, writes the Superintendent of the Dining Car Service as follows:—

"I was so pleased with the courtesy and attention of the Superintendent of the car by which I travelled here, that I think it only fair to mention it. The whole tone of his car and staff does him credit. Unmerited complaints you doubtless often receive. A deserved compliment should not be witheld."

Farmer Ads. will Bring Results.

and don't mind the change, particularly if we have some skimmilk and a little middlings or finely ground grain

I think we can cheapen the cost of raising a spring litter by having them come in April and turn out on clover when it has grown high enough. I never saw much advantage in keeping them in movable pens as some recommend, as they tramp down, dirty and destroy more than they eat. The clover they eat may do them good, but there is too great a waste of good feed by this method. If we have a fair sized field of clover, handy the buildings, that we can spare, we can work the pasturing of hogs and cattle nicely.

I once turned 20 hogs, between two and three months old, on a good field of clover and kept the cows in occasionally to keep it fed off the right height for them. In this way no feed was wasted and the clover was kept fresh all summer. These hogs got a mixture of milk, meal and water, twice a day, not half the amount of what would satisfy them, if kept inside, and they grew well and when pened up for fattening, proved thrifty feeders. I have no figures as to cost of this bunch, only a general estimate of the meal and milk, but I am satisfied that clover is a very cheap hog feed. We were not rearing all our calves, I would continue to grow a bunch of hogs in this way every summer. We usually have sufficient milk for all we do handle inside, though we raise and feed them both winter and summer.

Unless the pigs are farrowed before November, I leave them on the sow as long as possible. They eat with their dam and her milk keeps them growing right and in good shape and the warmer and drier their quarters the better. Heat is as important as feed. If a box stall is available, in a warm stable, it will pay to use it. I have seen some wonderful transformations in growth, from changing from warm to cold, and from cold to warm, dry quarters. If their pen cannot be kept warm, an enclosed bed may be made, where they can sleep warm and dry, and if they are given plenty of room to exercise in, will lessen the danger of them getting crippled. Once they go off their feet, its good bye to all profit. The time to take care of them is when they are right. If we have not plenty of skim milk for the newly weaned pigs, I find boiled turnips about the best substitute with a little middlings, bran or finely ground grain. I have no favorite mixture, any of our ordinary grains make good pork, together with roots. We only keep hogs to use up surplus amounts of both those crops and milk; but if we were not breeding purebred stock of other kinds, that require lots of milk, I would go pretty largely into hogs. We have no farm animal that can put on flesh so economically, or that can utilize such a varied assortment of feeds. We can get into the business quickly and the turn-over is as quickly made, but as with all other kinds of farm animals, if we wish to make profit out of the growing of them we must keep them gaining every day. A day without gain means a day's feed wasted. It is much cheaper to keep them warm in winter by providing warm quarters, than through their feed, for they must have it one way or the other, and almost every Maritime Farmer will find it profitable to keep, at least one spring and one fall litter; the former ready to market before November 1st, prices usually decline after this month of heavy delivery. If given intelligent usuage a brood sow will always be found a good paying animal whether we raise her entire litter or sell them at current prices to your neighbors.—W. M. Lea, Victoria, P. E. I.

Oliver Plows

THE group of Oliver plows built for Eastern Canada includes walking plows, three-wheel sulky plows, high and low lift gang plows, walking gangs, hillside plows, riding cultivators, and walking gang plows. Each of these is built for a certain purpose, and is the best plow obtainable for that particular purpose.

Back of the whole group is the fifty-nine years of successful plow experience of the Oliver Plow Works. This experience eliminates everything in the way of chance. You do not have to experiment with Oliver plows.

Go to the I H C local agent and tell him what kind of plowing you have to do, and he will sell you an Oliver plow built to do that kind of work and do it in the best possible manner. You can get catalogues and full information of the entire Oliver line from him, or, if you prefer, write the nearest branch house.

THE HORSE.

Beware.

At a recent meeting of the Record Committee, the following resolution was passed:

"That whereas animals bred, owned or imported by certain foreign breeders or importers, are denied registration in the Canadian National Records, Canadian importers, before purchasing animals abroad, should ascertain by communication with the Canadian National Record Office whether such animals are entitled to registration in Canada and thereby be entitled to entry into Canada free of duty."

How to get Rid of Bots.

In case it is believed the horses are troubled by bots, a very effective treatment which will remove them within two to 48 hours is as follows: The day preceding the treatment, a small amount of hay and a moderate amount of oats is given in the morning; in the evening, food is withheld and a purgative given—say six ounces of raw linseed oil. The day of treatment, at six o'clock in the morning, give one dram of carbon bisulphid in a gelatin capsule; at seven o'clock, repeat the dose in the same manner; and at eight o'clock give the third and last dose, making in all three drams of carbon bisulphid in three gelatin capsules.

If properly administered, the gelatin capsule reaches the stomach intact, but soon dissolves, and the carbon bisulphid rapidly evaporates, suffocating all bot larvae and other parasites with which it comes in contact, but not injuring the horse. Worms are quite often expelled as well.

This remedy has been used by the Department of Agriculture, with a large number of animals, and has proved successful.—Horse World.

A School for Horse-Shoers.

"What next?" We hear some of our readers say impatiently as they read the title of this article. Yet such a school is being conducted at Cornell University in New York State and Cornell prides herself on being a very practical institution. When we first heard of it we asked a prominent horse-breeder if there was any need for improvement in the art of shoeing horses. He instantly replied that there was a decidedly great need for better horseshoers for more horses are ruined by improper shoeing than by hard work or poor feeding.

This school at Cornell is of the nature of a practical Short Course for so-called experienced horse-shoers and is conducted by a graduate of the Dresden, Germany, School for Horseshoers. The course deals with the anatomy of the horse's foot, the treatment of diseased foot conditions, movement and remedial shoeing.

It is a well-known fact that much greater attention is given to this important matter in Europe than in America. It is to be hoped that such a school will soon be organized in the Maritime Provinces, for as we have said, proper horse-shoeing is a matter of importance to all owners and lovers of horses. Too long have we been entrusting the feet of our hores to inefficient shoers, with the result that diseased hoof conditions and ailments are very common.

Stallion Enrolment.

The law relating to stallions for service in Ontario says that—

No stallion shall be offered for service until enrolled and a certificate of enrolment issued;

All certificates of enrolment are to be renewed annually;

Stallions may be inspected if desired and report of inspection shall form part of certificate;

Certificates are issued in four forms:

Form I.—For pure bred, sound and inspected animals;

Form II.—For pure bred, sound and blemished;

Form III—For enrolled, pure bred, but not inspected;

Form IV.—For grade stallions.

It is now proposed to make this act more stringent, and it was with a view of securing popular endorsation in advance for the doing of this that stallion enrolment was made a subject of discussion at the Fair.

In opening that discussion, Drf Grenside said that in all the Provinces of Confederation, with the exception of Quebec, some form of stallion enrolment is provided for. Most of the States of the Union also have legislation bearing on this subject. Among the States having such legislation are Wisconsin, Illinois, Colorado, the two Dakotas, Vermont, New Hampshire, New Jersey, Massachusetts, Iowa, Kansas, Nebraska, Pennsylvania, Michigan, Utah, and California.

TO MAKE INSPECTION COMPULSORY.

"Up to the present," said Dr. Grenside, "inspection has been optional with Ontario stallion owners. It is proposed to ask the Legislature, at the forthcoming session, to make inspection compulsory. At present, too there is no machinery for the enforcement of the act, We propose to ask for the appointment of inspectors whose duty it will be to see the act enforced."

R. S. McVitty, of Muncey Institute said something more than this was required. "A man," he said, "may have two purebred stallions, and both sound, yet one, by reason of faulty conformation, may be nothing better than a scrub, while the other may be worth $1,500. Still both animals, under present legislation, are able to command precisely the same form of certificate from the Government examining board. The law should be changed so as to provide, in the case of pure bred, sound animals for No. 1, 2 and 3 standing, according to quality, with anything below No. 3 ruled out altogether."

Jno. Bright, Dominion Live Stock Commissioner, said it was proposed to obtain legislation next session to provide for this.

OBJECT TO ANNUAL ENROLMENT

Thos. McMichael, of Seaforth, raised other objections. "The law at present provides for annual enrolment, and the payemnt of an annual fee therefor," he said. "Why should an annual enrolment be provided for while the animal remains with the same owner? The only man in one section who had a horse inspected was a man who had the beginning of a bog, and he hoped, if he could get that past the inspector, to sell the horse on the strength of the inspection. Now that horse, simply because it was inspected, obtained a number two form of certificate while other horses because they were not inspected although they were sound, as this animal was not, would only get form 3. That is unfair."

AN INSUFFICIENT REASON

Mr. Bright said the reason a purebred animal, even if blemished, was given a higher standing than other purebred, free of blemish, was because the owner of the first had cooperated in the carrying out of the Act by offering his animal for inspection."

Mr. McVitty moved that inspection be made compulsory in all cases, and that provision be made for grading even purebred and sound animals according to quality, as shown by conformation.

WHO IS TO PAY COST?

Some of the breeders expressed the opinion that the cost of inspection should be borne by the Government, but Hon. Mr. Duff pointed out that the Government had passed the law in the first place at the request of the breeders.

Mr. Bright said that n his judgment grade stallions should be put out of business altogether, and asserted that if breeders were unanimous they could get legislation providing for this or anything else they might ask.

THIS YEAR'S INSPECTION

Dr. Greenside said that this year it is intended to have the work of inspection begin on the 17th of February. This year, too, instead of asking stallion owners to bring their animals to a central point, inspectors will go right to the stables of owners.

In the Maritime Provinces we have a Compulsory Stallion Enrolment Act. Owners of stallions may as well make up their minds early as late that ere long the public will demand compulsory inspection and the prohibition of the standing for service of scrub sires. Get ready for it. It's coming.

Adjusting Bandages.

Linen, flannel, or Newmarket bandages should be first tightly and evenly rolled, with the strings or tapes used for tying gathered up inside. The next is to make what is called the "point of attachment" by placing a fold of the free end of the bandage round the limb at the fetlock. The bandage is then carried downward so as to include the lower pastern and heel, if this is desired, and then upwards until the roll is exhausted, when the end is secured by the tapes which are sewn on to it. Each succeeding fold should overlap its predecessor to the extent of half the width of the bandage, and care be taken that the pressure is moderate, and, above all, even, and that the strings are not tied so tightly as to cut the limb, while being sufficiently secure to prevent slipping down, with consequent disturbance of the whole arrangement. One grave error, common in most stables, is leaving the bandages on too long. The longest period during which baodages should be allowed to remain on without removal is between late night and early morning stables, and before they are reapplied the limbs should be well hand-rubbed to re-establish the circulation, especially if during the time the bandages have been on they have become tight owing to swelling of the legs. This is very apt to occur in the case of animals that have become weak from disease, that are suffering from debility, or where there is any dropsical tendency. Due allowance needs to be made for this swelling of the legs during the night, and this is one of the reasons why the pressure should be no more than moderate. It is in cases where there is a tendency for the legs to "fill" that bandages are especially useful, as they support the circulation and tend to prevent, to a large extent, the effusion of fluid to which the swelling is due. As a rule, the swelling disappears on exercise, the movement exciting absorption, and the time to apply the bandages in these cases is as soon as the horse has been cleaned down on coming in from work, and while the legs are still "fine." It is in case of this kind that it is necessary that the pressure be firm, even, and regular, without being so tight as to cause discomfort or constriction if any swelling takes place.

PREVENTION OF WINDGALLS.

Another class of cases in which regular bandaging is calculated to prove of great service is in the prevention, and to a limited extent the cure, of windgalls. These "lumps" or soft swellings in the neighborhood of the fetlock joints of horses do not contain air or wind, as the old-fashioned farrier thought and taught, but are merely enlarged bursae, and their contents are fluid. The even pressure or regular bandaging tends to prevent the filling of these bursae after exercise has caused their partial or complete disappearance, in much the same way that pressure acts beneficially in cases where there is a tendency to "stocking" or "filling" of the legs. There are many cases of enlargement in which pressure is useful in the direction of promoting absorption, but when local pressure is required it generally has to be directed to the spot by special means, and of this form of pressure the spring trusses and elastic bandages used in cases of bog-spavin and thoroughpin are examples. The so-called "charge" applied to enlargements and sprained tendons causing lameness is a form of bandage, and there are a great many who still look on firing in this light, but the notion has long since been exploded, and whatever benefits are derivable from the use of the actual cautery, the manufacture of a "natural bandage" is not one of them. Surgical bandaging for the treatment of lameness is, however, no part of our subject, and what we wish to impress is the use of the ordinary bandage in preventing swelling of the legs and bursal enlargements about the fetlocks, and generally keeping the legs fine.—Veteran.

POULTRY.

How the 292 Egg Hen was Produced

Several issues ago the following article, under the caption "Nova Scotia Hen Holds World's Record," appeared in our columns:

"Rev. W. B. Crowell, of Arcadia, has a pullet of the Barred Plymouth Rock variety, which has beaten the world's record in laying the largest number of eggs in one year. Her product during the time specified was 292 eggs.

"Rev. Mr. Crowell sent to the American Poultry Journal attested state-

Lady Morley

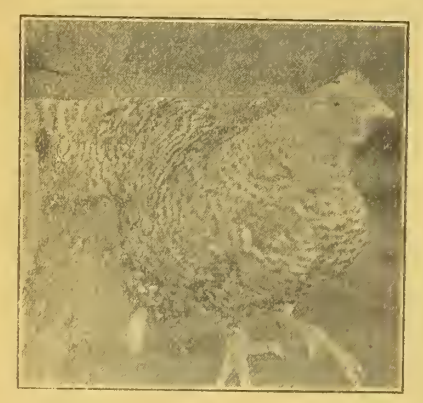
ment of her day by day record, which was acknowledged by Dr. Prince T. Woods, managing editor, who sends the following with its acknowledgement:

"It looks as if "Lady Morley' (his pullet's name), is world's champion to date. Oregon Experimental station is a close second with a cross-bred hen with 291 eggs to her credit.

"Mr. Crowell has a flock of sixteen pullets of the same variety, each of which produced 205 eggs in an average of 283 laying days this year."

We wrote Mr. Crowell for an article on how this hen was produced and cared for, and following is his reply:

"As the reports sent out by the experimental stations, like Oregon and



No. 304 Lady Morley

Missouri, have a tendency to discourage the amateur, because they have the money and appliances whereby they can produce such astonishing results and, as a rule, the amateur begins with a little capital and hopes to reap a profit from the beginning; I have therefore, at your invitation, jotted down a little of my experiences in order to demonstrate to the average poultry keeper the possibilities there are in poultry, even when one has only a little to begin with and little room in which to keep poultry. I know that the amateur can do equally as well as they have done in the experimental stations.

When I began four years ago I knew very little indeed about poultry. I subscribed to some of the best poultry journals, got all the bulletins I could from the Stations in Canada and U. S. Read what books I could borrow or buy and scanned every fortnight, the columns of the Maritime Farmer.

The barn connected with the parsonage, measures 18x20 feet. I made an opening 4x17 feet in the south side of it and covered it with chicken wire. I made waterproof curtains to keep out cold and storm. After a year, I gave up closing them in the winter and leave the opening uncovered day and night. One I have taken down, the other is used when the snow drifts. There are no curtains in front of the roosts. I cannot speak too strongly for the open front. There has never been any sickness frosted combs, dampness or odors in the house. It is the first essential for health. The floor is covered with straw, a foot or more in depth, and all grain is thrown into it. This makes the hens exercise all day long, and is a large factor in the heavy egg production that I get every winter without fail.

I believe that breed does not count as much as egg-laying strain. I was fortunate in being able to get some of Prof. Gowetts B. P. Rocks, before

Rev. W. B. Crowell, Arcadia, N. S. and his pets

Note Trapnests and other labor saving centrivances.

his farm was sold. In the autumn of 1910 I purchased a hen with a pullet record of 178 eggs, and another with a record of 217 eggs and a cock, whose dam had a record of 223 eggs. I had several pullets of the Wm. E. Bright strain and these composed my breeding pen in 1911. That year I raised 21 pullets some of which began to lay in October. All were trapnested and all drones and indifferent layers were killed. That year all that laid less than 175 eggs were thus disposed of. Only nine survived this culling, but they averaged 243 eggs, and Lady Morla had laid 283 and a half-sister, 281 eggs each in the year. From this pen, I raised 31 pullets and 15 from other sources.

Some of these began to lay as early as September in 1912. The same methods were followed and only 16 survived. These averaged 222 eggs. Lady Morley headed the pen with 292 eggs for her year's laying. This record, accompanied with a duly attested day-by-day record sheet, was published in the American Poultry Journal of Chicago, and Dr. Woods, the editor, editorially declared it to be a world's record. She is a daughter of the imported ben with the pullet record of 217 eggs, which was three years old when this chicken was hatched. Her sire was a son of the imported cock. I raised only 21 pullets last year, but by Christmas, 20 of them were laying.

The following records holds out the hope that the work of last year will be excelled. This laying up to Feb. 4th is:

*No. 301	in 134 days has laid	104 eggs
No. 302	in 91 days has laid	67 eggs
*No. 304	in 80 days has laid	71 eggs
No. 305	in 72 days has laid	57 eggs
Na. 308	in 71 days has laid	57 eggs

Progressive Jones says:

"Get Bumper Crops from Worn-Out Soil"

Scores, yes hundreds, of my farmer friends have got bumper crops from soils they thought were worn out. They now swear by

Harab FERTILIZERS

One of them, A. Robinson of Rosemount, tells me that he used Harab Fertilizers on potatoes and turnips without any manure on the land which was very old and poor. He got a bumper crop and is more than satisfied. Another man, D. J. Ferguson, got a grand crop from very light land that had been hard run by tenants.

Friend, if you have some poor land, some worn-out soil, don't be discouraged. Harab Fertilizers will make that soil yield bumper crops, and make you happy, or my name isn't Progressive Jones.

Harab Fertilizers are natural Fertilizers, manufactured from blood, bone, trimmings, etc., of animals slaughtered at the immense Harris Abattoirs. To these are added Potash and just enough quick-acting Nitrates and Superphosphates to start the plant off with a vigorous growth.

The cost of using Harab Fertilizers is small. The results are big. Write to The Harris Abattoir Co. for their booklet. It gives the information you want to know.

Yours for bumper crops
Progressive Jones

The Harris Abattoir Co., Limited, Toronto

11

BENN & TURNEY CO., LIMITED,

General Agents in New Brunswick for Harab Fertilizers.

RED ROSE TEA "is good tea"

*No. 309 in 65 days has laid 53 eggs
No. 316 in 50 days oas laid 38 eggs
No. 318 in 44 days has laid 36 eggs

Those marked with an asterisk (*) are daughters of Lady Morla, which in her pullet year, 1912, laid 283 eggs.

No. 304 is 9 eggs ahead of Lady Morley, the 292 egg hen in the same number of days. Five of the pullets have exceeded her record in the same number of days. Two other pullets she has only exceeded by one egg.

Doubtless many readers are asking themselves "what is his secret of feeding?" Really I have none and consider the open air front and deep litter of more consequence. I have fed wheat, barley, corn and oats in the litter, but this year oats being so poor and barley not appealing to me, I have used only whole wheat and corn. Wheat is feed in the morning, corn at night, a palm full of grain to each hen. Wet mashes are very infrequently used, only when I wish to give them some of French's Poultry Mustard, which is the best stimulant obtainable, because of no bad after effects. A dry mash composed of bran, chopped wheat, cornmeal, gluten meal, crushed oats and a small portion of linseed meal was always before them. But since this year's flock showed little liking for the dry mash, I do not use much. In other years sprouted oats, turnips and mangel beets were fed. This year I have none. Thus far the average production of eggs has been maintained and it may be that green food is not as essential as it is claimed. Still I prefer to use it, although I found little value in alfalfa. There are two things that I do use a great deal of: namely, fresh cut bone and skim and buttermilk. Duriog the winter the milk almost altogether takes the place af water.

In the summer all the pens are turned into one flock, the cocks being kept separate. Two yards, each 30x 70 feet are attached to the barn. When the flock is in one yard, the other is seeded down in grain. In six weeks time, the flock goes into this yard, and the other is then sown. Thus they alternate all summer long, and in the early autumn, are in good laying condition.

Thus from these statements it is seen that anyone, without a great amount of labor, can successfully raise heavy layers. There are three things to be observed, open air, plenty of exercise and simplicity in management, for simplicity is the great law of poultrydom.—W. B. Crowell, Arcadia, N. S.

Annual Show of the Carleton County Poultry and Pigeon Association.

The seventh annual show of the above association was held in the Forrester Building, Hartland, Jan. 28th, 29th and 30th. At this show, although the smallest of any in the history of the association, were to be seen a comparatively small collection of birds, but the stock was excellent and in fine shape, while the display of dressed stuff, namely poultry and ducks, was a revelation to many of the visitors, and furnished a base of argument and illustration for those in charge, to enlarge on and emphasize the great and evident improvement in the fattening and dressing of fowls at present, as compared with such work a few years back, before the interest in better poultry, alive or dressed, was created by the poultry association. Certainly a great revolution has been accomplished in this industry in which almost every family in the county is more or less engaged. During the early history of this association great interest was shown and a large number of exhibitors were present every year with good exhibits, and crowds of interested visitors were a certainty. Interest began to lag, however, and although there are more bird fanciers than ever in the county and much more and far better stock, public spirit seems to be lacking and for the last two or three years only strenuous efforts by a few faithful optimists saved the association from complete failure.

The tide is beginning to turn again and during the coming year certain changes will be possible that will place the association on a different footing and the show for 1915 will be the biggest and best in the society's history.

Among the exhibitors were the following, Hartland Poultry Yards with a large exhibit, and with winners in the following breeds, vis., Barred Rocks, White Rocks, Buff Wyandottes Golden Wyandottes, Rhode Island Reds, both combs; Light Brahma, Black Langshan, S. G. Dorking, Brawn Leghorn S. C., White Leghorn S. C., Black Orpington, S. P. Hamburgs, Houdan, Anconas, White and Buff Turkeys, Toulouse, Embden, Chinese and African Geese, Rouen, Ayesbury, Indian Runner and Mallard Ducks, Pigeons and Dressed Stuff.

Mrs. Ethel Kidney, Hartland, won prizes on Barred Rocks, Buff Rocks, White Rocks, Buff 'Dottes, Golden 'Dottes, R. I. Reds, both combs; Light Brahma, Black Langshan, S. G. Dorking, Brown Leghorn, S. C.; White Leghorn S. C., Black Orpington, White Orpington, S. P. Hamburgs, Houdan, Ancona, Black and White Turkeys, Rouen Ducks and Dressed Poultry.

Dr. L. DeC. McIntosh, Hartland, won on the following: Dark Brahma, Buff Cochin, White Langshan, Black Minorca, Bronze and Black Turkeys, Cayuga and Indian Runner Ducks.

Chas. E. Shaw, Victoria, N. B., won on Rhode Island Reds, S. C.

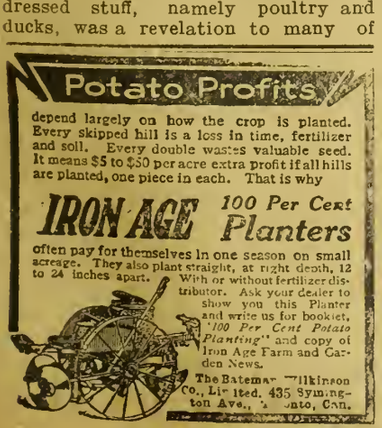
The Deep Creek Poultry Yards of H. L. Kennedy, Hartland, had winners in White Wyandottes, Buff Orpingtons, White Rocks, Anconas.

Mrs. Albert Hovey, East Brigton, as usual was out to win with Barred Rocks, Rhode Island Reds, S. C.; White Leghorns, Buff Orpingtons, White Orpingtons, Toulouse Geese, Pevin and Rouen Ducks and a large display of dead stuff. This exhibitor was the winner in the egg-laying contest conducted by the local agricultural department under the supervision of Mr. Seth Jones, her two entries taking first and second place, against the province.

Mrs. W. J. Davis, Waterville, showed some excellent birds and won a fair proportion of blue favors, she being particularly strong on White Rocks, Rhode Island Reds, both combs: Pekin and Muscovy Ducks, also a big winner in the dead classes.

Shaw Bros., Highland Farm, Victoria, were successful exhibitors in Rhode Island Reds, both combs, and Bronze Turkeys.

Frank A. Aiton, Hartland, showed some excellent specimens of White Wyandottes and was the only exhibitor and consequently a big winner in Andalusians.—Chas. M. Shaw, Secy. C. C. P. & A. Association.



Potato Profits
depend largely on how the crop is planted. Every skipped hill is a loss in time, fertilizer and soil. Every double wastes valuable seed. It means $5 to $50 per acre extra profit if all hills are planted, one piece in each. That is why
IRON AGE
100 Per Cent Planters
often pay for themselves in one season on small acreage. They also plant straight, at right depth, 12 to 24 inches apart. With or without fertilizer distributor. Ask your dealer to show you this Planter and write us for booklet, "100 Per Cent Potato Planting" and copy of Iron Age Farm and Garden News.

PEERLESS-PERFECTION
The Fence That's Locked Together
The attacks and onslaughts of animals can't faze it. It's strong, yet springy. Manufactured from Open Hearth steel galvanized wire. When made by this process, impurities are burned out of the metal, removing one of the chief causes of rapid corrosion or rusting.
Read What Others Say
Gentlemen:—There is no fault to find with your fence. The fencing I put up 4 years ago is just as good as the day I put it up, showing no sign of rust, and giving good satisfaction. The Peerless stands the test better than any other make that I have seen. Yours truly, JOHN MASON. Spring Brook.
Gentlemen:—I have been in the fence business for ten years, and I find no fence like the Peerless, both for galvanizing and workmanship. I consider it equal, if not superior to any other make of fence on the market today. I have always found the Banwell-Hoxie Fence Co. people of their word. Yours respectfully, MACK. LILLIS. Glenburnie, Ont.

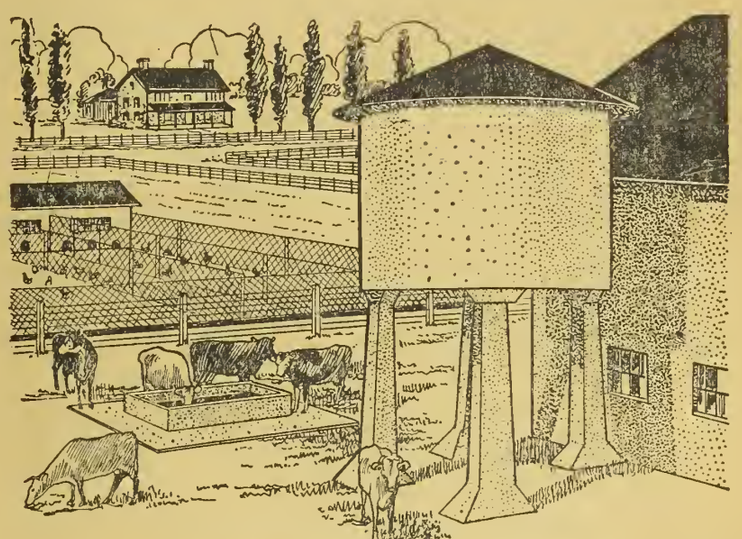
130-Egg Incubator and Brooder Both For $13.90

FREIGHT AND DUTY PAID

If ordered together we send both machines for only $13.90 and we pay all freight and duty charges to any R. R. station in Canada. We have branch warehouses in Winnipeg, Man. and Toronto, Ont. Orders shipped from nearest warehouse to your R. R. station. Hot water, double walls, dead-air space between, double glass doors, copper tanks and boilers, self-regulating, Nursery under egg tray. Especially adapted to Canadian climate. Incubator and Brooder shipped complete with thermometers, lamps, egg testers—ready to use when you get them. Five year guarantee—30 days trial. Incubators finished in natural colors showing the high grade California Redwood lumber used—not painted to cover inferior material. If you will compare our machines with others, we feel sure of your order. Don't buy until you do this—you'll save money—it pays to investigate before you buy. Remember our price of $13.90 is for **both** Incubator and Brooder and covers freight and duty charges. Send for FREE catalog today, or send in your order and save time.

Write us today. Don't delay. WISCONSIN INCUBATOR CO., Box 326, Racine, Wis., U. S. A.



Concrete Tanks and Troughs Never Rot or Leak

THE most practical tanks, whether for water or sewage, are built of concrete. They never rust, rot, dry out or leak. They never need new hoops or paint. They last a lifetime and seldom require repairing, which makes them the cheapest tanks that can be built.

Clean, Sanitary Watering Troughs

are just as necessary as the animals that drink from them. The farmer's best interests are being served when his stock is insured a plentiful supply of clear, clean water from a trough that is permanent and sanitary.

"What the Farmer can do with Concrete" is the name of a handsome free book that tells all about concrete tanks, watering troughs and other uses of concrete that will save every farmer many dollars. Write for it to-day.

This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. adies, this department is yours. Use it to the best advantage.

David Copperfield.

By Charles Dickens.

"Oh, indeed, you must excuse me Master Copperfield! I am greatly obliged, and I should like it of all things, I assure you; but I am far too umble. There are people enough to tread upon me in my lowly state without my doing outrage to their feelings by possessing learning. Learning ain't for me. A person like myself had better not aspire. If he is to get on in life, he must get on umbly, Master Copperfield."

I never saw his mouth so wide, or the creases in his cheeks so deep as when he delivered himself of these sentiments; shaking his head all the time, and writhing modestly.

"I think you are wrong, Uriah," I think there are several things that I coulh teach you, if you would like to learn them.

"Oh, I don't doubt that, Master Copperfield," he answered; "not in the least. But not being umble yourself, you don't judge well, perhaps, for them that are. I won't provoke my betters with knowledge, thank you. I'm much too umble. Here is my umble dwelling, Master Copperfield!"

We entered a low, old-fashioned room, walked straight into from the street, and found there Mrs. Heep, who was the dead image of Uriah, only short. She received me with the utmost humilityi and apologized to me for giving her son a kiss, observing that, lowly as they were, they had their natural affections, which they hoped would give no offence to any one. It was a perfectly decent room, half parlor and half kitchen, but not at all a snug room. The tea things were set upon the table, and the kettle was boiling on the hob. There was a chest of drawers with an escritoir top, for Uriah to read or write at of an evening; there was Uriah's blue bag lying down and vomiting papers; there was a company of Uriah's books commanded by Mr. Tidd; there was a corner cupboard; and there were the usual articles of furniture. I don't remember that any individual object had a bare, pinched, spare look; but I do remember that the whole place had.

It was perhaps a part of Mrs. Heep's humility, that she still wore weeds. Notwithstanding the lapse of time that had occurred since Mr. Heep's decease, she still wore weeds. [illegible] in the cap; but otherwise she was as weedy as in the early days of her mourning.

"This is a day to be remembered, my Uriah, I am sure," said Mrs. Heep, making the tea, "when Master Copperfield pays us a visit."

"I said you'd think so, mother," said Uriah.

"If I could have wished father to remain among us for any reason," said Mrs. Heep, "it would have been, that he might have known his company this afternoon."

I felt embarrassed by these compliments; but I was sensible, too, of being entertained as an honored guest, and I thought Mrs. Heep an agreeable woman.

"My Uriah," said Mrs. Heep, "has looked forward to this, sir, a long while. He had his fears that our umbleness stood in the way, and I joined in them myself. Umble we are, umble we have been, umble we shall ever be," said Mrs. Heep.

"I am sure you have no occasion to be so, ma'am," I said, "unless you like."

"Thank you, sir," retarted Mrs. Heep. "We know our station and are thankful in it."

I found that Mrs. Heep gradually got nearer to me, and that Uriah gradually got opposite to me, and that they respectfully plied me with the choicest of the eatables an the table. There was nothing particularly choice there, to be sure; but I took the will for the deed, and felt that they were very attentive. Presently they began to talk about aunts, and then I told them about [illegible]; and about fathers and mothers and then I told them about mine; and then Mrs. Heep began to talk about fathers-in-law, and then I began to tell her about mine;; but stopped, because my aunt had advised me to observe a silence on that subject. A tender young cork, however, would have no more chance against a pair of corkscrews, or a tender young tooth against a pair of dentists, or a little shuttlecock against a pair of battledores, than I had against Uriah and Mrs. Heep. They did just what they liked with me; and wormed things out of me that I had no desire to tell, with a certainty I blush to think of; the more especially as, in my juvenile frankness, I took some credit to myself for being so confidential, and felt that I was quite the patron of my two respectful entertainers.

They were very fond of one another that was cereain. I take it, that had its effect upon me, as a touch of nature: but the skill with which the one followed up whatever the other said, was a touch of art which I was still less proof against. When there was nothing more to be got out of me about myself (for on the Murdstone and Grinby life, and on my journey, I was dumb), they began about Mr. Wickfield and Agnes. Uriah threw the ball to Mrs. Heep, Mrs. Heep caught it and threw it back to Uriah. Uriah kept it up a little while then sent it back to Mrs. Heep, and so they went on tossing it about until I had no idea who had got it, and was quite bewildered. The ball itself was always changing too. Now it was Mr. Wickfield, now Agnes, now the excellence of Mr. Wickfield, now my admiration for Agnes; now the extent of Mr. Wickfield's business and resources, now our domestic life after dinner; now, the wine that Mr. Wickfield took, the reason why he took it, and the pity that it was he took so much; now one thing, now another, then everything at once; and all the time, without appearing to speak very often, or to do anything but sometimes encourage them a little, for fear they should be overcome by their humility and the honor of my company, I found myself perpetually letting out something or other that I had no business to let out, and seeing the effect of it in the twinkling of Uriah's dinted nostrils.

I had begun to be a little uncomfortable, and to wish myself well out of the visit, when a figure coming down the street passed the door—it stood open to air the room, which was warm, the weather being close for the time of year—came back again, looked in, and walked in, exclaiming loudly, ;'Copperfield! Is it possible?"

It was Mr. Micawber! It was Mr. Micawber, with his eye-glass, and his walking stick, and his shirt-collar, and his genteel air, and the condescending roll in his voice, all complete!

"My dear Copperfield," said Mr. Micawber," putting out his hand, "this is indeed a meeting which is calculated to impress the mind with a sense of the instability and uncertainty of all human—in short, it is a most extraordinary meeting. Walking along the street, reflecting upon the probability of something turning up, (of which I am at present rather sanguine), I find a young but valued friend turn up, who is connected with the most eventful period of my life; I may say, with the turning-point of my existence. Copperfield, my dear fellow, how do you do?"

I cannot say—I really cannot say—that I was glad to see Mr. Micawber there; but I was glad to see him too, and shook hands with him heartily, inquiring how Mrs. Micawber was.

"Thank you," said Mr. Micawber, waving his hand as of old, and settling his chin in his shirt-collar. "She is tolerably convalescent. The twins no longer derive their sustenance from Nature's founts—in short," said Mr. Micawber, in one of his bursts of confidence, "they are weaned—and Mrs. Micawber is, at present, my travelling companion. She will be rejoiced, Copperfield, to renew her acquaintace with one who has proved himself in all respects a worthy minister at the sacred alatr of friendship."

I said I should be delighted to see her.

"You are very good," said Mr. Micawber.

Mr. Micawber tben smiled, settled his chin again, and looked about him.

"I have discovered my friend Copperfield," said Mr. Micawber genteelly, and without addressing himself particularly to any one, "not in solitude, but partaking of a social meal in company with a widow lady, and one who is apparently her offspring—in short," said Mr. Micawber, in another of his bursts of confidence, "her son. I shall esteem it an honor to be presented."

I could do no less, under these circumstances, than make Mr. Micawber known to Uriah Heep and his mothers; which I accordingly did. As they abased themselves before him, Mr. Micawber took a seat, and waved his hand in his most courtly manner.

"Any friend of my friend Copperfield's," said Mr. Micawber, "has a personal claim upon myself."

"We are too umble, sir," said Mrs. Heep, "my son and me, to be the friends of Master Copperfield. He has been so good as take his tea with us, and we are thankful to him for his company; also to you, sir, for your notice."

"Ma'am," returned Mr. Micawber with a bow, "you are very obliging; and what are you doing, Copperfield? Still in the wine trade?"

I was excessively anxious to get Mr. Micawber away; and replied, with my hat in my hand, and a very red face, I have no doubt, that I was a pupil at Doctor Strong's.

"A pupil?" said Mr. Micawber, raising his eyebrows. "I am extremely happy to hear it. Although a mind like my friend Copperfield" to Uriah and Mrs. Heep; "does not require that cultivation which, without his knowledge of men and things it would require, still it is a rich soil teeming with latent vegetation —in short," said Mr. Micawber, smiling, in another burst of confidence, "it is an intellect capable of getting up the classics to any extent."

Uriah, with his long hands slowly twining over one another, made a ghastly writhe from the wrist upwards, to express his concurrence in this estimation of me.

"Shall we go and see Mrs. Micawber, sir," I said, to get Mr. Micawber away.

"If you will do her that faver, Copperfield," replied Mr. Micawber, rising. "I have no scruple in saying in the presence of our friends here, that I am a man who has, for some years, contended against the pressure of pecuniary difficulties." I knew he was certain to say something of this kind; he always would be so boastful about his difficulties. "Sometimes I

A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write to-day. Address: Mrs. M. Summers, Box. . 309 Windsor, Ont.

WOMAN A GREAT SUFFERER

Tells How She Was Restored To Health by Lydia E. Pinkham's Vegetable Compound.

Tilbury, Ont.—"I could praise Lydia E. Pinkham's Vegetable Compound all around the world because it has done so much for me. For two years I was so run down that I was unable to do my work. I had female weakness and dreadful periodic pains, constipation and backache, but now I am well of all these things. I took Lydia E. Pinkham's Vegetable Compound, Liver Pills and Sanative Wash. I give you permission to publish this letter to help others." — Mrs. WILFRED MARCHAND, Box 464, Tilbury, Ontario, Can.

Case of Mrs. Tully.

Chicago, Ill. — "I take pleasure in writing to thank you for what Lydia E. Pinkham's Vegetable Compound has done for me. I suffered with such awful periodic pains, and had a displacement, and received no benefit from the doctors. I was advised to take Lydia E. Pinkham's Vegetable Compound, and am now as well as ever."—Mrs. WILLIAM TULLY, 2052 Ogden Avenue, Chicago, Ill.

If you have the slightest doubt that Lydia E. Pinkham's Vegetable Compound will help you, write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass., for advice. Your letter will be opened, read and answered by a woman, and held in strict confidence.

CHALLENGE COLLARS

Are a boon to every man who cares for his personal appearance.

Challenge Collars are not shiny rubber collars. They have a dull linen finish. In fact, you can't tell them from linen. Keep up appearances—keep down laundry bills.

Sold at all Gents' Furnishing and Dry Goods Shops, or send 25c. for sample collar.

The Arlington Company of Canada, Limited, TORONTO

NATIONAL EMPORIUM, Wholesale Dealers, BEEBE, QUE.

This is the season of the year when mothers feel very much concerned over frequent colds contracted by their children, and have abundant reason for it as every cold weakens the lungs, lowers the vitality and paves the way for the more serious diseases that so often follow. Chamberlain's Cough Remedy is famous for its cures, and is pleasant and safe to take. For sale by all dealers.

have risen superior to my difficulties. Sometimes my difficulties have—in short, floored me. There have been times when I have administered a succession of facers to them; there have been too many for me, and I have given in, and said to Mrs. Micawber, in the words of Cato, 'Plato, thou reasonest well. It's all up now. I can show fight no more.' But at no time of my life," said Mr. Micawber, "have I enjoyed a higher degree of satisfaction than in pouring my griefs (if I may describe difficulties, chiefly arising out of warrants of attorney and promissory notes at two and four months, by that word) into the bosom of my friend Copperfield."

Mr. Micawber closed this handsome tribute by saying, "Mr. Heep, Good evening. Mrs. Heep! Your servant," and then walking out with me in his most fashionable manner, making a good deal of noise on the pavement with his shoes, and humming a tune as he went.

It was a little inn where Mr. Micawber put up, and he occupied a little room in it, partitioned off from the commercial room, and strongly flavored with tobacco smoke. I think it was over the kitchen, because a warm greasy smell appeared to come up through the chinks in the floor, and there was a flabby perspiration on the walls. I know it was near the bar, on account of the smell of spirits and jingling of glasses. Here, recumbent on a small sofa, underneath a picture of a race-horse, with her head close to the fire, and her feet pushing the mustard of the dumb waiter at the other end of the room, was Mrs. Micawber, to whom Mr. Micawber entered first, saying, "My dear, allow me to introduce you to a pupil of Dr. Strong's."

I noticed, bye-the-bye, that although Mr. Micawber was just as much confused as ever about my age and standing, he always remembered, as a genteel thing, that I was a pupil of Dr. Strong's.

Mrs. Micawber was amazed, but very glad to see me. I was very glad to see her, too, and, after an affectionate greeting on both sides, sat down on the small sofa near her.

"My dear," said Mr. Micawber, "if you will mention to Copperfield what our present position is, which I have no doubt he will like to know, I will go and look at the paper the while, and see whether anything turns up among the advertisements."

"I thought you were at Plymouth, ma'am," I said to Mrs. Micawber, as he went out.

"My dear Master Copperfield," she replied, "we went to Plymouth."

"To be on the spot," I hinted.

"Just so," said Mrs. Micawber. "To be on the spot. But, the truth is, talent is not wanted in the custom house. The local influence of my family was quite unavailing to obtain any employment in that department, for a man of Mr. Micawber's abilities. He would anly show the deficiency of the others. Apart from which," said Mrs. Micawber, "I will not disguise from you, my dear Master Copperfield, that when that branch of my family which is settled in Plymouth became aware that Mr. Micawber was accompanied by myself, and by little Wilkins and his sister, and by the twins, they did not receive him with that ardor which he might have expected, being so newly released from captivity. In fact," said Mrs. Micawber, lowering her voice,—"that is between ourselves—our reception was cool."

"Dear me," I said.

"Yes," said Mrs. Micawber. "It is truly painful to contemplate mankind in such an aspect, Master Copperfield, but our reception was, decidedly, cool. There is no doubt about it. In fact, the branch of my family which is settled in Plymouth became quite personal to Mr. Micawber, before we had been there a week."

I said, and thought, that they ought to be ashamed of themselves.

"Still, so it was," continued Mrs. Micawber. "Under such circumstances, what could a man of Mr. Micawber's spirit do? But one obvious course was left. To borrow of that branch of my family, the money to return to London, and to return at any sacrifice."

"Then you all came back again, ma'am;" I said.

"We all came back again," replied Mrs. Micawber. "Since then, I have consulted other branches of my family on the course which it is most expedient for Mr. Micawber to take—for I maintain that he must take some course, Master Copperfield," said Mrs. Micawber, argumentatively. "It is clear that a family of six, not including a domestic, cannot live upon air."

"Certainly, ma'am," said I.

"The opinion of those other branches of my family," pursued Mrs. Micawber, "is that Mr. Micawber should immediately turn his attention to coals."

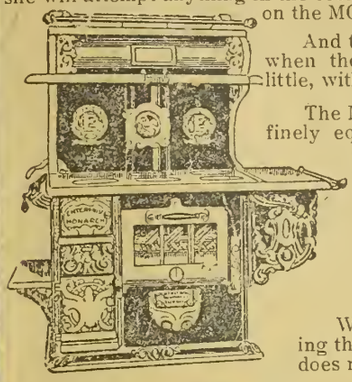
"To what, ma'am?"

"To coals," said Mrs. Micawber. "To the coal trade. Mr. Micawber was induced to think, on inquiry, that there might be an opening for a man of his talent in the Medway Coal Trade. Then, as Mr. Micawber very properly said, the first step to be taken early was, to come and see the Medway. When we came and saw I say 'we,' Master Copperfield; for I never will," said Mrs. Micawber with

"THE ENTERPRISE MONARCH"

CANADA'S FINEST STEEL RANGE

inspires the housekeeper with a feeling of confidence and security. With it she will attempt anything in the cooking line, for she knows she can depend on the MONARCH to respond to her needs.



And this in warm weather or extreme cold, when there is much baking to be done or very little, with consequent fuel economy.

The MONARCH is so easily controlled, so finely equipped and so thoroughly constructed, that it answers every need of a first-class, up-to-date range that will burn coal or wood and give plenty of hot water.

The cost is moderate, considering the type of the range and the years of service it will give with a minimun expense for repairs.

Write for our illustrated circular, explaining the MONARCH in detail, if your dealer does not handle this range:

Manufactured By the Enterprise FOUNDRY CO. SACKVILLE, N.B. Sold by all Enterprise Dealers

For Baking Success —This Oven Test

Success on some baking days can be expected no matter what flour you use. But constant success is rarer. It can be assured in only one way. The miller must select his wheat by oven test.

So from each shipment of wheat we take ten pounds as a sample. We grind this into flour. Bread is baked from the flour.

If this bread is high in quality, large in quantity, we use the shipment from which it came. Otherwise we sell it.

Constant baking success comes as a matter of course from flour bearing this name

PURITY

"More Bread and Better Bread" and "Better Pastry Too"

526

c ct on, "I never will desert Mr. Micawber,"

I murmured my admiration and approbation.

"We came," repeated Mrs. Micawber, "and saw the Medway. My opinion of the coal trade on that river, is, that it may require talent, but that it certainly requires capital. Talent, Mr. Micawber has; capital, Mr. Micawber has not. We saw, I think, the greater part of the Medway; and that is my individual conclusion. Being so near here, Mr. Micawber was of opinion that it would be rash not to come on and see the Cathedral. Firstly, on account of its being so well worth seeing, and our never having seen it; and secondly, on account of the great probability of something turning up in a cathedraol town. We have been here," said Mrs. Micawber, "three days. Nothing has, as yet, turned up; and it may not surprise you, my dear Master Copperfield, so much as it would a stranger, to know that we are at present waiting for a remittance from London, to discharge our pecuniary obligations at this hotel. Until the arrival of that remittance," said Mrs. Micawber with much feeling, "I am cut off from my house (I allude to lodgings in Pentonville), from my boy and girl, and from my twins."

(Continued in next issue)

Acute Rheumatism.

Acute rheumatism is rarely immediately fatal, but very often leaves the victim with difficulties which, sooner or later, terminate his life. This occurs whenever the heart becomes affected by the disease, which not infrequently happens. It does not result from a change of the seat of the malady from the joints to the heart, as is sometimes thought, but by an extension of the disease to the lining membranne of the heart. In consequence of inflammation, the valves of the heart become quickened and contracted, so that valvular organic disease of the heart results—rheumatism, indeed, is the most common cause of this form of heart disease. The extension of the disease to the heart is indicated by the occurrence of acute pain in the left side, disturbance of the pulse, increase of fever, and increased frequency of respiration. Either one or all the joints in the body may participate in the inflammation. The joints are generally affected symmetrically; that is, the ankles, wrist, knees, elbows, or shoulders will be affected on both sides at the same time. When this is not the case, analogous joints upon the same side are likely to be affected, as the ankle and wrist, the knee and elbow, the hip and shoulder, etc. Sometimes the disease appears to be very fickle, changing constantly from one joint to another, without any apparent cause, the change taking place within a few hours.

It is now generally conceded by medical authorities that acute rheumatism or rheumatic fever may be caused by a number of different micro-organisms. It has also been noticed that inflammation of the joints resembling rheumatism frequently occurs in connection with various infectious diseases, such as scarlet fever, spinal meningitis, and dysentery. It has also been noted that attacks of rheumatism frequently occur in connection with tonsilitis. Many cases have been reported in which a liability to rheumatic attacks seem to disappear with the removal of the tonsils, which are subject to frequent attacks. Rheumatism differs from most other infectious diseases in the fact that one attack is no protection against a second attack, but rather the opposite. predisposition to rheumatism seems also to be transmitted by heredity. There appears to be a close relation between acute and chronic rheumatism in that acute rheumatism is sometimes followed by the chronic form of the disease. So-called rheumatic nodules, which frequently occur, especially in cases of rheumatism in children, are likewise found in persons suffering fram migraine, also in rheumatic gout. Meat-eating, beef-drinking, the use of tea and coffee excessive eating, exposure of the body to prolonged chilling when perspiring or in a state of fatigue, and neglect of the bowels, are among the most potent predisposing and active causes of the disease.

HANDSOMELY DECORATED 97-Piece Dinner Sets

GIVEN FREE TO CANADIAN WOMEN

By "EVERYWOMAN'S WORLD"

CANADA'S GREATEST HOME MAGAZINE

These beautiful dinner sets were made for us by ono of England's most famous manufacturers. They are delightfully decorated in rich floral rose designs with garlands of foliage in the very newest patterns. **EACH SET COMPRISES 97 PIECES,** guaranteed full size for family use—an absolutely complete dinner service for a family of twelve people. The picture herewith was taken directly from a photograph of the set, but fails to do justice to its quality, or the charm of the decoration. You will be proud to have such a dinner service in your home, and no matter how much you paid you could secure nothing more complete, serviceable or pleasing.

"EVERYWOMAN'S WORLD" wants 150 married ladies at the heads of homes to obtain these magnificent dinner sets. You are not asked to spend any money or buy anything in order to obtain one of them for your home. Read this offer if you want one of these sets.

We want every Canadian housekeeper to become acquainted with "EVERYWOMAN'S WORLD," Canada's greatest monthly home magazine. **SINCE NOVEMBER LAST OVER 50,000 WOMEN IN AS MANY CANADIAN HOMES HAVE SENT US YEARLY SUBSCRIPTIONS TO THIS GREAT MAGAZINE,** but we are not satisfied. We are determined to have 100,000 subscribers for 1914 and are sparing no expense to reward the ladies who will assist us in reaching this mark and who by their advice and suggestions for the improvement of "EVERYWOMAN'S WORLD," will help us to maintain it, not only as the greatest Canadian magazine, but to make it so necessary to every reader that it will become an absolute institution in every Canadian home.

A very little effort on your part—just a few minutes conversation with a few of your friends—will help us in this work and can gain for you one of these magnificent complete 97-pieee dinner sets. This offer is absolutely unique in the history of Canadian journalism.

"EVERYWOMAN'S WORLD" is needed in every woman's home. It is a big, bright, breezy entertaining and instructive magazine, running from 40 to 52 pages a number. It abounds in charming short stories, live interesting articles, news of the day, advice on home management, the eare of children, cooking, etc. It has an excellent fashion department and pattern service and shows each month the very latest fashions of New York, London and Paris. It has departments of music, giving its readers each month a new and original sheet of music, departments of art, beauty hints, family health, money-making hints for women and many other features that make it absolutely necessary to every home. "EVERYWOMAN'S WORLD" is delightfully illustrated by the foremost artists of both Canada and the United States, and its beautiful art covers in colors are always charming. In fact, no expense has been spared to make it the most interesting and useful magazine in Canada.

The wonderful thing about "EVERYWOMAN'S WORLD" is that this great magazine is sold at a subscription price of only 50c. per year.

Just think—only 50c. for 12 whole months' subscription.

This Free Sample Copy for You

If you want to gain one of these beautiful dinner sets, write to us to-day and we will send you postage paid, absolutely without charge or obligation, a copy of the current number of "EVERYWOMAN'S WORLD," which we ask you to read over carefully and prove to yourself that it is all we claim for it—the greatest magazine value in Canada. Then take it among your friends and neighbors, show it to them and let them see what a magnificent magazine they can bring into their homes for an expense of only 50c. a year. Get their opinions on it. We want you to tell us what they say about "EVERYWOMAN'S WORLD," and we will send with your copy some very interesting literature telling of many big features that "EVERYWOMAN'S WORLD" will give its readers during 1914.

To qualify for the awarding of one of these magnificent dinner sets we ask that you secure us eight yearly subscriptions to "EVERYWOMAN'S WORLD" from among your friends at 50c. each and remit to us the $4.00 you will have obtained for same.

From your own opinions and the conversations and experienee you have when getting your eight subscriptions, we will ask you to answer a set of questions we have compiled giving us your advice and suggestions on improvements in "EVERYWOMAN'S WORLD" which we have under consideration for 1914. **HERE ARE A FEW EXAMPLES OF THE QUESTIONS WE ASK YOU TO ANSWER.** We send you a printed list of them. You will, of course, understand them much better when you have read a copy of the magazine.

"Should we publish more or less short stories?"

"Should we publish long or serial stories, giving an installment each month, or do you think a month too long to wait between each installment?"

"Would you like to see more or less new fashions published in "EVERYWOMAN'S WORLD"?"

"Do you find any advantage in a pattern service through which you can secure patterns of the fashions shown?"

"'EVERYWOMAN'S WORLD" publishes an original sheet of music each month. Do you think this page could be better given to a story or article of more general interest?"

"Do you approve of the family doctor department, which gives subscribers the free privilege of writing to the physician in charge for advice on matters of family health, hygiene, dieteties, and so forth, or do you consider that it would be better to encourage women to consult their family physicians on such matters?"

"Should we give more advice on household management and publish more articles on cutting down the cost of living? Do you think women like to receive advice of this kind which may be the very opposite to their own methods of doing things?"

"Do you find that men read a magazine like "EVERYWOMAN'S WORLD," which is published primarily for women?"

There are 17 questions in all, of a similar nature to the above, that we want you to answer for us. You know we cannot go among our people when they subscribe and ask them what they like best in "EVERYWOMAN'S WORLD," or what they would like to see us publish, so we ask you to do it for us. Thus by telling us just what you think and your friends say about "EVERYWOMAN'S WORLD" you will help us to keep it in its position of household favorite.

You can easily give us the information we seek after having spoken to and secured eight new subscribers, for which we at once reward you handsomely, with your choice of several useful and costly gifts, and it is for the value of these suggestions and your advice to us that these 150 magnificent 97-piece dinner sets are being awarded. Bear in mind that Canada's greatest magazine, a journal with over 50,000 subscribers in all parts of Canada, is behind this offer. There are no strings or conditions of any kind attached to it. A photographic reproduction of the complete set will be mailed to you with your sample copy and the 150 complete 97-piece dinner sets, exactly as represented, will be awarded to the ladies sending us the best suggestions and answers to our questions.

This offer is open only to householders—married ladies who are at the heads of homes. Write to-day and get your free copy of "EVERYWOMAN'S WORLD," together with the questions we want you to answer about the new features we will bring out during 1914. You take no risk and incur no obligation. You cannot fail to find eight ladies among your friends and neighbors who will be glad to have "EVERYWOMAN'S WORLD" every month for a subscription of only 50 cents a year. Enelose a two-cent stamp to pay postage on your copy and sign your full name (as Mrs. Frederick J. Brown or Mrs. Leouard T. Dawson, &c.) and give complete address.

We will pack each set in a strong case without charge, and prepay at Toronto, all freight and delivery charges. Write for your sample copy and further particulars of this great offer to-day. Address fully as below and mark corner of your envelope "CIRCULATION MANAGER."

"EVERYWOMAN'S WORLD" Dept. 95 16—18 Sheppard St, TORONTO, ONT. 10

Osler and other eminent authorities agree that medicines have little or no effect in shortening the course of this disease. It has been shown that a person suffering from rheumatism with rest and proper care usually recovers without any treatment. But there can be no doubt that many things can be done for the patient that will tend greatly to shorten the course of the disease and allow very great relief from the suffering incident to the painful malady.

A rheumatism patient should first of all be provided with a suitable bed. This should consist of a soft, smooth hair mattress. He should be further provided with woolen night garments. Linen or cotton sheets should be replaced by woolen sheets so that the patient will be less likely to chill after prespirating. It has been noted that in this disease there is apparently an overproduction of lactic acid, much of which is excreted by the skin, causing the perspiration to become acid. The tendency to perspiration should be encouraged by frequent sweating baths. The affected joints should be kept as quiet as possible. In case the knee or elbow joints are affected, it is a good plan to place the limb upon a splint and so avoid motion of the painfal joint. Hot fomentations applied over the affected joints also give great relief. The joints should be kept constantly enveloped in warm applications. Moist heat may sometimes be changed for dry heat, in the form of bags filled with salt or some similiar substance as hot as can be borne. Hotwater bags constitute the best methods of applying dry heat in these cases. The patient should be allowed an abundance of drink. Lemonade, with a very little sugar, is one of the best drinks, as the juice of the lemon seems to have some influence upon the disease in some cases. Warm sponge baths often add to the patient's comfort.

The diet of the patient during the attack should consist wholly of simple preparations of fruits and grains. Meat of all kinds, as well as beef-tea, should be wholly avoided. The use of meat after convalescence is begun is a frequent cause of relapse, hence flesh should be wholly discarded.—Good Health.

Herbageum by Parcel Post.

During nearly thirty years Herbageum has been tested without failure and it is known to be the best thing on the market for horses, cows, sheep, pigs, poultry and especially for calves. If it is not for sale where you deal write to The Beaver Mfg. Co., Ltd., Galt, Ont., Canada, sole manufacturers of Herbageum. Farm House Food.

Beef hot-pot.—Ingredients: 2 lb. of shin of beef, 1 lb. of potatoes, two small carrots, one small turnip, two onions, a bunch of herbs, some haricot beans boiled until nearly soft, pepper and salt, stock.

Method: Cut the meat into neat pieces, season to taste with pepper and salt, and prepare and slice the carrots, turnips, onions, and potatoes, having the latter cut into pieces about half an inch thick. Put a layer of the mixed vegetables into the hot-Pot first, then a layer of meat, and repeat this until the dish is nearly full, putting the herbs in about midway. Moisten well with stock, put a layer of potato-slices at the top, put a greased paper over the top, then the lid of the hot-pot, and cook in a slow oven until quite tender. Serve very hot with a serviette pinned round the dish.

Mutton hot-pot.—Cut the best end of a neck of mutton into neat joints. At the bottom of the hot-pot put a layer of sliced potato, carrot, and onion, a sprig of parsley, and some cooked rice; then add a layer of meat. Repeat this process until the hot-pot is nearly full, and then moisten with stock, into which a little red-currant jelly has been stirred. Put a thick layer of rice on the top, and bake in a slow oven.

Aberdeen hot-pot.—Cut up about 2 lb. of neck of mutton into neat pieces At the bottom of the pot put a good layer of sliced carrot, chopped leeks, and onions, parsley, chopped celery, and thinly sliced turnips. Now put in the meat, add an ounce of pearl barley, and cover with a layer of the mixed vegetables. Moisten well with broth, into which has been mixed smoothly half an ounce of patent barley. Cover, and bake slowly and gradually.

Rabbit hot-pot.—Ingredients: Two young rabbits, 1 oz. of butter, red-currant jelly, sliced potatoes, sliced tomatoes, stock, one tablespoonful of chopped shallot, salt and pepper, chopped herbs, a little grated lemon-rind.

Three Weeks Course in AGRICULTURE At Woodstock Agricultural School March 9 to 28, 1914

SUBJECTS OF STUDY

1st Week

HORTICULTURE—Orchard sites and soils; varities and nursery stock; planting, cultivation, and cover crops; spraying, pruning and grafting; picking, packing, and judging; insects and diseases. Also small fruits and vegetables.

BEE-KEEPING—Life of the bee; care and management of the colony; honey production and marketing.

2nd Week

FIELD CROPS—Judging and production of grains, grasses, clovers and alfalfas, potatoes, roots and corn.

SOIL MANAGEMENT—Cultivation; drainage; fertilizers; crop rotations; control of weeds.

3rd Week

LIVE STOCK — Breeding, feeding, management and judging of horses, cattle, sheep, and swine.

DAIRYING—Milk production; cream separators; Babcock testing; butter-making.

POULTRY—Egg production; housing; incubation and rearing; judging; marketing.

Outside men of high standing will assist the men of the Department of Agriculture.

SPECIAL NOTICE—To encourage attendance from more distant parts of the Province the Government will, for this year, refund the cost of railway fare amounting to $2 or more to students from any part of New Brunswick who remain at Woodstock during the whole three weeks. Get a receipt from the railway company when buying your ticket.

100 p. c. Increase in Crops

The French Minister of Agriculture says that farms in Europe have doubled their productiveness in 100 years, and that 70 p. c. of this is due to the use of commercial fertilizers.

Such an increase could be obtained only by using good fertilizers. "Made at Windsor Fertilizer" is not only good fertilizer, but the best fertilizer.

It is manufactured at

WINDSOR, NOVA SCOTIA

in the largest—best equipped—and most up-to-date Fertilizer Factory in Canada.

When you buy your fertilizer ask "Is this Fertilizer made at Windsor, Nova Scotia?" If the man says "Yes", you are getting the best.—If he says "No", you are not.

Write us and we will give you the name of the nearest "Made at Windsor, Nova Scotia" Fertilizer Agent.

Buying 1,500 one pound sheets you have your wants filled at 59 cents per ream. These prices go into force on and after February 10th, 1914. All goods shipped parcel post.

The Maritime Farmer
SUSSEX, N. B.

What Women Have Accomplished in Ireland.

F. X. Cullen writes from Ireland to one of our Canadian newspapers:

"The Woman's National Health Association has just published in a diagram showing in a startling manner the good effect of its campaign against tuberculosis, which I suppose you know is the chief scourge under which Ireland suffers. This campaign is now being carried on in every town and village in Ireland and the sanitary education of the people is progressing wonderfully. The death rate for 1910 has just been announced. It is 2.3 per 1,000, the lowest figure since the registration af deaths was introduced in 1864. High water mark was reached in 1900 and 1904, in both of which years the death rate from tuberculosis rose to 2.9 per 1,000. This means that while in 1900 and 1904 about 12,000 persons were carried off by the scourge, last year only about 10,000 persons succumbed to it. It is estimated that for every death there are seven or eight persons suffering from the disease, so the figures indicate that there are about 16,000 fewer persons in Ireland suffering from consumption now than there were in 1904.

"It may be expected, too, that as time goes on the number of deaths will drop much more rapidly, for a good many of those who are suffering and dying now must have contracted the disease under the old bad conditions which are disappearing. The new generation will grow up free from the tuberculosis taint, and after the present generation of sufferers dies off we may expect a big drop in the death rate.

"All this is due to the voluntary work of the Women's National Health Association. Travelling lectures are employed, many of whom travel from village to village in vans which are used to give free exhibitions of the danger of unventilated and overcrowded living rooms. I have seen cottages recently which until a few years ago never had a window that could be opened, fitted with large sunny windows thrown open to the fresh air in all weather. There is hardly a village now that cannot show the traveller a consumptive who has been cured by the fresh air treatment."

Some Maple Sugar Sweets.

To keep the body well adjusted and efficient, one needs to eat a certain amount of sugar, and there is no other manufactured that fills this want so completely, when taken with moderation and at the proper time, as maple sugar. Especially is this the case with growing children, when some sweet is absolutely necessary to keep the daily menus well balanced. The housekeeper, too, who must cater to the appetites of her household with the grocery store three or four miles away, or depend on the uncertain visits of the supply-man who calls at her door, is never at a loss for a substitute when her sugar runs low, if she has a goodly supply of maple sugar on hand; like her resourceful forebears she can turn, with equal satisfaction, to this pure wholesome home product for her sweetening. In fact, she finds the flavor of many of her desserts, as well as other dishes, greatly improved by its use. Among the recipes given here are some new preparations that are well worth testing.

Vermont maple waffles are delicious when served nicely buttered and piping hot. To make them, soften one cupful of finely shaved maple sugar in three cups of milk. Sift one quart of flour with three teaspoonfuls

With Every Batch

of bread you make with Regal Flour successfully, you will wonder why you didn't try it before. No use waiting. Get

REGAL FLOUR

now, and avoid baking-day troubles.

Too many cooks spoil the bread by using inferior flour. Don't *you* make this mistake, but always insure success in baking by using only REGAL FLOUR. Acknowledged to be the most uniformly excellent of any flour sold.

Get a barrel from your grocer. If it isn't satisfactory, we'll refund your money.

The St. Lawrence Flour Mills Co., Ltd., Montreal, Canada

A WONDERFUL REMEDY

Orange Lily is daily curing the most obstinate cases of Female Disorders. Falling of the Womb, Leucorrhoea, Painful and Suppressed Menstruation, etc., etc., are all of them relieved from the start by its use, and a few weeks' or months' treatment accomplishes a complete cure. This remedy is a positive, scientific preparation, and is based on the discoveries of Pasteur and Lister. It is an applied treatment; that is, it is not taken internally, but is applied direct to the suffering parts, and it, therefore, acts with all the certainty of the known laws of chemical action. As it comes in direct contact with the diseased tissue, its antiseptic and nerve-food properties cannot help have a beneficent influence. I receive from 10 to 50 letters daily, speaking of the benefits and cures it is performing, and so sure am I that it will do what is claimed for it that I will send, absolutely free, a 35c box to every suffering woman who will write for it. Price, $1 per box, which is sufficient for one months' treatment. Address, MRS. FRANCES E. CURRAH, WINDSOR, ONT.

of baking-powder and one saltspoonful of salt, then rub in one tablespoonful of softened butter. Beat the yolks of four eggs until light, then add the milk and sugar, and stir gradually into the flour; beat thoroughly, fold in the whites of eggs beaten stiff and dry, and beat again. Bake in well-greased and heated waffle-irons.

Maple nut biscuits are especially nice served with fresh fruit, or for the children's school lunches. Chop one-half cupful of walnut meats, and mix with one cupful of finely shaved maple sugar; this will be more satisfactory if put through the meat chopper. Sift one quart of flour with four teaspoonfuls of baking powder and a little salt three times, then add two tablespoonfuls of softened butter or lard, and sufficient sweet milk to make a soft dough. Turn out half the dough on a floured board; knead lightly and quickly; roll out in a thin sheet and cut with a small biscuit cutter; brush over the top of each with a little milk or white of egg, and spread with a layer of the maple mixture. Roll out the remaining dough and cut out in the same manner; place one on each of the first and stand the biscuit in a baking-pan, far enough apart that they do not touch during the baking. Brush the tops with white of egg, and bake twenty minutes in a quick oven. A small lump of maple sugar, on a perfect half of a nut meat may be added to the top of each if one likes.

Some Causes of Dampness in House.

1. Dampness may be due to the location of the house.

2. If the flow of the surface water is toward the house, it may cause dampness. If there is a choice of three heights for the location of the house, a high, a low, or a medium site, the highest is always safest.

3. Ground water may cause dampness in house or yard. A knowledge of the character of rock or soil underlying a house-site is necessary before a location be chosen. The ground water is the water that has filtered through the soil until it has struck some impervious substance such as rock or clay. It is found in different places at different intervals. The height of water in a well shows the level of the ground water For building, it is best to have the ground water far from the surface of the ground. If the ground water is near the surface, the cellar and yard will be damp.

4. If there is a choice of soils for buildings, a gravel or sandy soil is best as water will quickly filter through a porous soil, hence such a soil dries out quickly after a rain. Clay holds moisture and water will not pass through it quickly. People living in a house built on a soil of clay often suffer from rheumatism because of the excessive dampness.

5. If many trees surround the house there is danger of dampness. Leaves hold moisture and prevent the light and sun from entering the dwelling.

6. A verandah or roof overshadowing all the windows of a room will cause dampness.

7. The windows in a room sometimes are not of sufficient number or are not opened enough to keep the house dry.

8. A house is oftentimes damp because the shades are drawn during the sunny hours of the day, in order to protect the furniture and hangings from the light. It has been aptly asked which is better, "Faded furniture or faded lives?"—Grace F. Smiley, Colorado Agricultural College.

Fertilizers Their Nature and Use.

(Continued from page 326)

By keeping up the humus, or decaying vegetable matter content of the soil, and by proper cultivation, much can be done to increase the fertility of the soil. Through these means the soil has a greater power of absorbing and retaining moisture and become more friable, hence more easily worked or cultivated. The changing of the insoluble compounds of the soil to available plant food under these conditions is much more rapid and better results are obtained from commercial fertilizers. Briefly, cultivation and humus are of the utmost importance in improving the soil as a medium for the production of crops.

It has been emphasized that plant food to be absorbed by the plant must be in a soluble condition; that each element has a particular function; that one plant food cannot be substituted for another; and that, by keeping up the humus content of the soil and by proper cultivation, better results are obtained from the use of commercial fertilizer.—E. M. Lads, Truro, N. S.

Potato Growing in York Co.

Editor Maritime Farmer:

Perhaps you or your readers might be interested in what is being done in one branch of farming in this part of the Province, that is potato raising.

My son, J. Murray Murch, concluded he would try potato raising on a small scale, he arranged with Geo. F. Burden, ex-M. P. P., to work part of his farm, which joins our own, and from which Geo. F. Burden had moved some sixteen years ago, and taken the hay and grain growth on it away without putting any manure or fertilizers back on the land, of any description. Part of it had been plowed, a crop of oats grown, ground reseeded again. It had got so poor for grass in places, that it was not worth cutting, although the field was smooth, no one would cut it on any share being given them for the cutting.

What grew on the land was yellow top mostly. The soil was a light, sandy loam, on one end of the field; the other and smaller end was a rotten limestone, mixed with clay. Began plowing about the middle of May Plowed eight acres, then harrowed it with springtooth and disc harrows, until he got it quite mellow. Then he began to plant with planter about the 26th of May, but the superphosphate had been out in a heavy rain, was damp, and did not work well, kept clogging machine and made slow progress. Came a rainy spell, quit planting for a few days, could not get more than six hundred pounds to the acre of the phosphate. After waiting for dryer weather he planted more of the piece, finishing the eight acres the 7th June. While waiting for suitable weather for planting. He plowed another piece of about 2½ acres separated from the pieces he had planted, by a little brook. He served one acre of this same as he had the first and planted one acre of potatoes, using about 600 lbs. superphosphate to the acre. Finished his planting the 11th June. About the time the potatoes were breaking the ground he put in with the planter 800 lbs. more of phosphate to the acre, making 1,400 lbs. in all, to the acre. Variety planted were Delawares, except 1 barrel Golden Coin, from which he had 33 barrels. He used in all for the 9 acres, 32 barrels. Cultivated them with cultivator and horse hoe. Sprayed them with Bordeaux mixture several times till they got so rank and stout that you could not drive through them. Dug them with a potato digger had in all 1205 barrels from the nine acres, af which 160 barrels were small, cut with the digger, or rotten. Most of them are here in the cellar now, waiting for the embargo to be taken off, or Canada to accept the Reciprocity with the U. S. that she refused a year or two ago.

I have another son, who works the home farm. He generally plants about four acres each year to potatoes. Last year he planted the usual sized piece, one acre of which had been a cow yard the year before, and very rich. He also manured two acres more with barnyard manure heavily. The remaining acre we had done nothing with for years, it being the top of the slope to the River St. John, and steep, it was hard working it. We put more superphosphate on it, probably 300 lbs. or more to the acre. Very few of them rotted. We also used the Bordeaux mixture. Our neighbors on the other side of us has been using the Bordeaux mixture for years, did not use it last year and his crop was as good as ours. Only the line dividing the two farms between the two pieces. So it seems Bordeaux mixture does not always help the potato.

This part of York County is full of potatoes, nearly every farmer has from 100 to 1500 barrles for sale. We have in our cellar 1,000 barrels now. The price is too low to suit the farmers. You might ask why we did not sell before the embargo was put on. Until the ground froze, farmers were too busy to spare the time and our nearest railway station is Keswick, 15 miles away and a hilly, hard road to haul; 11 barrels being a hard haul for a good team. We usually sell to haul in March, when we can haul on the river as we can take a double quantity then. They are also building the St. John Valley R. R.. They are putting up the stel bridges and laying the track this winter. They may get so they can take a few cars of potatoes this spring; but to be of any benefit to us here on the east side of the river, would have to do it before the ice gets bad in the spring. But we have another chance, after the river opens and the logs begin to run we pick up the floating logs make a bottom, put out potatoes on it and take them to Fredericton. We often take 250 to 300 barrels on one raft.

We have shipped potatoes to Montreal, but generally it is not so satisfactory as to Boston. In Montreal, about every man you meet talks French half the time to you. You also have to sell in 90 lb. bag lots. Boston is the same as our own.— J. H. Murch.

Annual Meeting N. S. Poultry Association.

The Annual Meeting of the N. S. Poultry Assn. took place at the Agricultural College on Thursday evening, Jan. 15th, 1914. Representatives were present from nearly all the poultry clubs in the province. The minutes of the organization meeting held a year ago were read and approved. The Secretary gave a brief outline of the Act which was passed by the Governos. Council and Assembly on the 13th day of May, 1913. Mr. Frank Jackson spoke briefly of the success of the shows held by the C. B. Poultry Assn. and stated that poultry had improved in quality and quantity as g result of the shows. He also stated some of the difficulties which were met with in financing the show. Mr. Cook of Yarmouth, also stated that the Yarmouth people would not patronize

Crops with the Guesswork Left Out

"They Weighed, they Measured, and they Knew"

TWO brothers, market gardeners in Kent County, Rhode Island, planted 3 acres of sweet corn with Bowker's Stockbridge exclusively, and 6 3-5 acres on a competing brand of fertilizer. The corn from the Bowker gave them $104.76 per acre and the 6 3-5 acres on the competing brand gave them $35.65 per acre. The difference was $69.11 per acre. If they had used

BOWKER'S FERTILIZERS

on the whole acreage these figures indicate that they would have been $456.13 better off.

The Bowker part yielded 76 per cent of No. 1 corn, while the competing brand gave but 59 per cent. The proportion of fodder produced by the Bowker acres as compared with that grown on the competing brand was as $28 to $12. One of the brothers writes, *"I know, as we sold it by the ton and had it weighed."* This is characteristic of the whole experiment,—they weighed and they measured and they *knew.*

BOWKER'S FERTILIZERS

are preferred by those who weigh, measure and *know* their results, whether they grow sweet corn or any other crop. They are rich in available forms of plant food. They start crops growing and keep them growing through to maturity, for they supply crops *what* they want *as* and *when* they want it.

¶Our catalogue is helpful and it is free. Ask us for your copy before you forget it.

¶Also send for rules of our 1914 prize contest in growing corn. Every New England farmer has a chance at the prizes.

BOWKER FERTILIZER COMPANY
43 Chatham St., Boston.

the show as much as they had expected, and as a result they were somewhat handicapped for funds to carry on the work in future. He, however, stated the poultrymen were enthusiastic and believed that they would find a way to make their show a success in the future. Rev. Miles Tompkins spoke of the organization in Antigonish County, of a poultry club and looked forward to a successful show being held there in the near future. Mr. W. W. Osborne spoke for the poultry club in New Glasgow, and stated that their show had been a success. This year they had much better success financially than the two years previously, owing to the much more favorable weather which they had had. He also stated that they had put in other attractions besides poultry to induce the general public to attend. They, however, were very sanguine as to the results from their efforts. He spoke particularly of the results in the improvement of the poultry in Pictou county. Mr. Pierce, of Kings Co., spoke of the organization of a club in that county and believed it would result in the impropement of the quality of the poultry in having an organization and an annual show. Mr. McIsaac, of Inverness Co., suggested that the Poultry Association should petition for more assistance to carry on the work. Prof. Cumming, Honorary President of the Association, spoke at some length, advising the members to pay close attention to the improvement of their stock, and to stand together for the best interests of their industry. He also said he was favorable to these organizations which had for their object the improvement of the live stock of the province.

Considerable discussioo followed in regard to what should be done in cases where two or more clubs should organize in a county. After listening to several in regard to this matter it was decided to leave the matter in the hands of the secretary to make the best arrangements possible to carry out the work of the club in every county.

The following officers were elected:

Pres.—W. W. Osborne, New Glasgow.

Vice-Pres.— I. C. Craig, Amherst.

Sec.-Treas.—J. P. Landry, Truro.

Executive Committee—E. E. Frehill, New Glasgow; W. A. Godfrey, Yarmouth; Frank E. Jackson, North Sydney; W. H. Henry, Shubenacadie; C. H. Wisener, Pictou; C. O. H. Webster, Pictou; Geo. Thompson, Halifax

Meeting adjourned.

Field Crop Competition in New Brunswick.

The Field Crops Competition started in New Brunswick in 1910 and the work was carried on in five counties only. Since then the work has grown till in 1913 the entry list has almost doubled in each county and two more counties have been added to the list. The counties which have had the enterprise to take up this work are: Kings, York, Victoria, Northumberland, Westmorland, Kent and Carleton.

The last two mentioned have come into the competition for the first time this year and have entered into the work so enthusiastically that their entry lists have rivaled any of the others.

The results so far have shown marked improvement in the quality of the seed sown and also in the methods of handling and cultivation. In fact, some of the farmers have got so many new ideas that they are actually starting a private seed business—for example—one farmer in Northumberland County sold all his competition oats for 75c per bushel, and could have sold more.

In judging fields in the same counties for successive years, one is constantly coming across exceptional fields of grain and is invariably informed by the owner that the seed sown had been procured from the winning field of the previous year.

The crops in the competition vary in the different counties and include wheat, oats, barley, buckwheat, potatoes and turnips.. In the southern part of the province very little wheat is raised on account of the difficulty in getting it properly milled. But it is possible to raise good wheat anywhere in the Province. The favorite variety is White Fife, Red Fife and White Russian coming in r equal popularity. Oats are in competition in all the counties and Banner Oats head the list. In the matter of Barley, six-rowed gives most satisfaction, but in general the barley grown is not up to what it should be. Competition work in turnips is converting the care of that crop from a drudgery into a pleasure.

The Potato Competition is of the greatest importance to the Province of New Brunswick at the present time. New Brunswick potatoes are destined to win a world wide reputation. The best field visited averaged eighteen (18) maketable potatoes to the hill. This field was in Northumberland County, where the competition is carried on according to methods recommended by the Canadian Seed Growers' Association. The buckwheat competition is peculiar to York County.

It is worthy to note that in Kings, York and Carleton the winning fields of oats were grown from registered seed of the Banner variety.

So far, a large sum of money has been paid out in prizes and so far, no case has been found where a farmer has refused his prize money.

The success of the movement throughout the province has been due to the untiring efforts of Mr. S. J. Moore, who is in charge of the competitions for the Maritime Provinces.—F. M. Fiske, Florenceville,

Maritime Cows in the Official Records.

In the list of fourteen day official records completed between January 1st to 15th, 1914, we find the following cows:—

Mature Cows.—Wilhelmina Van Voran, 9468, age 5 years, 11 monehs, 27 days; milk, 440.5 lbs; lbs. fat, 14.11 lbs. the equivalent o, 17.63 lbs. butter, 80 p. c. fat. Owned by Lea & Clark, Victoria, P. E. I.

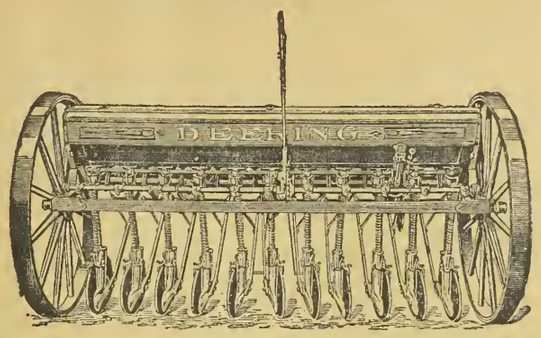
Junior Three-Year-Old Class.—Miss Rooker Posch, 14895, age 3 years, 3 months and 13 days; lbs. milk 402.7; :bs. fat, 12.92; the equivalent of 16.15 lbs. butter, 80 p. c. fat. Owned by Lea & Clark.

Senior Two-Year-Old-Class—Beauty Rooker, 18451, age 2 years, 10 mos. and 2 days; lbs. milk, 322; lbs. fat, 12.11, the equivalent of 15.14 lbs. butter, 80 p. c. fat. Owned by W. M. Lea, Victoria, P. E. I.

Nettie Rooker, 18453, age 2 years, 11 months; lbs. milk, 299; lbs. fat, 10.57, the equivalent of 13.22 lbs. butter, 80 p. c. fat. Owned by W. M. Lea

A meeting of the four co-operative fruit companies in Berwick was held in Forresters' Hall recently. Addresses were delivered by A. E. McMahon and A. E. Adams. Many questions were asked. The meeting was one of a series now being held amongst all companies of The United Fruit Companies, Ltd. These meetings, so it is reported from the sections in which they are held, are all of a most encouraging nature. Full advantage is taken of the opportunity given to individual members to become acquainted with the work of the central organization.

Deering Drills



GIVE your seed a chance to produce a record crop by sowing it with a Deering drill. Deering disk and hoe construction puts the right amount of seed in the right position at the bottom of the furrow, to insure your getting a full even stand of grain.

No matter whether your ground is hard or soft, gravel or clay, smooth or rough, level or hilly, there is a Deering drill in the line that will plant your seed as it should be planted.

Examine Deering drill construction and the many features. Note the light draft, the large capacity grain boxes, the double-run force feed that handles all kinds of grain and seed, the ease of regulation to suit soil and seed—and a dozen other points to grow enthusiastic over.

See the drills themselves at the I H C local agent's place of business. Our catalogues tell you all the features of all the types. Get catalogues from the local agent, or write the nearest branch house.

This Fence Has Vast Strength

For a fourth less than the price we pay, we could get hard-drawn steel wire. But that kind, though used in most other wire fences, hasn't the *life*, the springiness, the strength we insist on for Maritime Wire Fence.

• • • •

So we make this fence of extra-heavy hard drawn steel wire of nine-gauge. Constantly we test it for quality. And so we *know* this fence has *more* strength than it probably will ever need.

• • • •

Yet the price of Maritime Wire Fence is no higher than you must pay for ordinary fence. But the life of the Maritime Fence is far longer—and the fence surely reliable.

• • • •

On this extra-quality wire we put a smooth, even heavy coat of galvanizing. We put on more than enough—that's our way. You gain by the longer life of this better fence. And we lock laterals and upright wire rigidly, yet springily, with a cross-leverage lock that simply CANNOT let go under the hardest strain.

• • • •

You can bank on the strength of this fence Make the test for yourself and your neighbors. Then get the agency—it will pay you well. Address

Rabies in Cattle.

Veterinarians are very frequently asked as to the danger from milk, blood, or saliva of rabid cattle. The experience and observations of many authorities indicate that there is slight, or almost no risk from milk consumed in the ordinary way. It is conceivable that milk from a rabid cow might produce rabies in case of a distinct injury or abrasion of the mucous membrance lining the mouth, stomach, or intestines. It might be possible, also, for such milk to prove dangerous to very young infants, on the theory that the mucous membrane lining the digestive tract of the infant is less resistant to germ infection than in case of older people.

Actual experience shows, however, that such infections, either from milk in connection with an abraded mucous membrance or when given young infants, must be exceedingly rare.

It has been shown by experiments, that dogs may be fed the brain of a rabid dog, or milk from a rabid cow, without harm; but if broken glass for example, be mixed with the feed so as to scratch the lining membrane

HAD INDIGESTION

For Over

Ten Years.

Weakening the body will never remove dyspepsia or indigestion, on the contrary, all efforts should be to maintain and increase the strength.

Burdock Blood Bitters will do this, and at the same time enable you to partake of all the wholesome food required, without fear of any unpleasant after results.

Mr. Henry P. White, Surretteville, N.B., writes:—"I have been troubled with Indigestion for more than ten years; tried several doctors, and different medicines, but all without success. Having heard of the many cures effected by Burdock Blood Bitters, I decided to give it a trial. I have taken one bottle, and I feel that I am cured at last. I can now do the same hard work I could before I was taken sick."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

She highly recommends these medicines to her friends and the public.

Sold everywhere at 50c. per bottle, $5.50 per dozen.

Do you know that more real danger lurks in a common cold than in any other of the minor ailments? The safe way is to take Chamberlain's Cough Remedy, a thoroughly reliable preparatian. and rid yourself of the cold as quickly as possible. This remedy is for sale by all dealers

then rabies may be produced in the dog by such feeding of either brain or milk. Sanitation officers are quite generally agreed in the view, that the danger from consumption of milk is not of much practical importance. It happens occasionally that people use milk from a cow that is developing rabies, before they know what is wrong with her. Of course, no one would use milk from a cow that was evidently rabid.

Experiments have shown that the danger from virulent blood is exceedingly variable. If thoroughly dried for two or three days, it loses virulence to such an extent that it is probably not dangerous. However, if blood or brain substance in any considerable quantity remains frozen, it will retain virulence for a long time. It is found that such material does not retain dangerous virulence at room temperature more than two or three days after it has been thoroughly dried.

There is ordinarily little or no danger from saliva around the cow yard or straw pile, because the virus is destroyed by the sun, or dried by the wind, and because the chance of infection by inoculation is so slight.

Saliva may become virulent from four to ten days before the animal shows symptoms.—M. H. Reynolds, Veterinarian, University Farm, St. Paul.

Clip the Udder.

It is not uncommon among dairy cows to find the udder covered with a dense growth of long hair which, although they may be of some protection to the udder, nevertheless, from the standpoint of sanitation and comfort to the cow during milking are a detriment. Under ordinary farm conditions they are generally covered with filth and even in the best kept dairies, unless clipped, collect some dust and filth. Furthermore, because of their location, it is highly probable that some of them will find their way into the milk pail during milking. In order that such conditions may not occur these hairs should be clipped close once or twice each year, thereby preventing collection of filth and permitting greater ease in washing the udder.

It has been my experience that "kickers" are also developed when breaking heifers to milk because of these long hairs. When the milker grasps the teat during milking, the surrounding hair is included, and with each stream drawn the hairs are given a good vigorous pull. Is it any wonder that the heifer kicks you pail and all, into the gutter?

A common pair of horse-clippers are best suited for the clipping of the hair. If a large herd is to be clipped, a hand-power machine should be provided. The clipping should extend over the flank and thigh on the right side, as this will make it easier to keep the side above the milk-pail clean. In the production of special or certified milk, this precaution should always be observed in addition to the customary washing of udders. In ordinary milk production it will help to eliminate much filth, which means better milk, and better milk eventually means better prices.—H. E. Dvorachek, Colorado Agricultural College.

Don't overlook an untruth, yet weigh carefully between untruthfulness and a vivid imagination. It is often a hair-splitting task, but no mistakes should be made.

Don't correct your child in the presence of others. You yourself would find this very hard to brook, so why regard this little being as less sensitive?

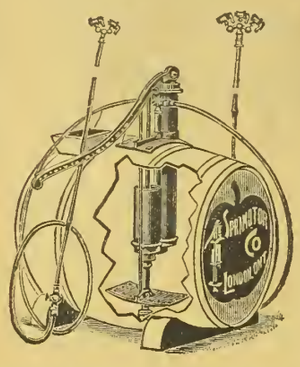
Spramotor Superiority

Can be Proven to Your Own Satisfaction!



The strongestclaims we may make for the **Spramotor**, supported by the guarantee we give with every machine and its undoubted record of supremacy wherever used, may fail to convince some men.

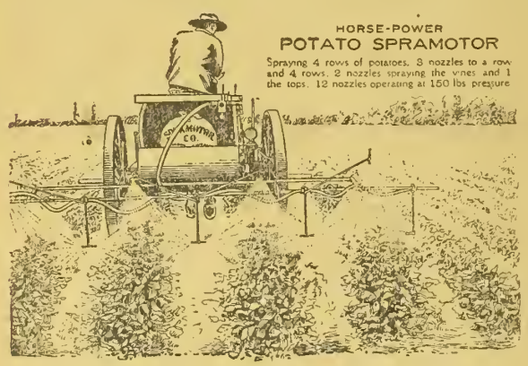
For such as want further **indisputable proof** from disinterested users, the following list will furnish names that are famous the world over.

Write Any of These Users for Complete Proof.

Dominion Experimental Farm, Ottawa, Ont.
Dominion Experimental Farm, Nappan, N. S.
Dominion Experimental Farm, Winnipeg, Manitoba.
Dominion Experimental Farm, Brandon, Man.
Dominion Experimental Farm, Indian Head, Sask.
Dominion Experimental Farm, Charlottetown, P. E. I.
Department of Agriculture, Victoria, B. C.
Department of Agriculture, Fredericton, N. B.
MacDonald College, Ste. Anne de Bellevue, P. Q.
St. Boniface College, St. Boniface, Man.
J. A. Couture, Quarantine Station, Quebec P. Q.
A. Lippins, President Agr. College of Belgium
State Entemologist, Pusa, India.
India Tea Association, Calcutta, India
Agricultural College, Amherst, Mass., U. S. A.
Agricultural College, Durham, N. H.
Department of Agriculture, Columbus, Ohio
Department of Agriculture, W. Raleigh, N. C.
Department of Agriculture, Albany, N. Y.
Department of Agriculture, New York, N. Y.
Department of Agriculture, Blacksburg, Va.
Department of Agriculture, Boston, Mass.
State College, Ames, Iowa
State College, State College, Pa.
Michigan Agricultural College, Agricultural College, Michigan
U. S. Department of Agriculture, Washington, D. C.
St. Anthony Park Experimental Station, St. Paul, Minn.
Purdue University, Lafayette, Ind.
University of Maine, Orono, Maine
Cornell University, Ithaca, N. Y.
Harvard University, Jamaica Plains, Mass.

The above are mostly institutions to whom money is no object—colleges and government departments who **must** have the best on the market. As a rule they do not spray for profit so much as for purposes of experiment. They have to find out **for the benefit of agriculture in general,** how best to combat pests, parasites and diseases affecting trees, plants, vegetables and grains. In order to do this, all have chosen the **Spramotor** as being capable of the most effective work.

You can get the advantage of their intimate knowledge of the subject by writing one or several of them. These institutions will gladly tell you where the **Spramotor** stands as a pest killer, weed exterminator and for spraying purposes generally.



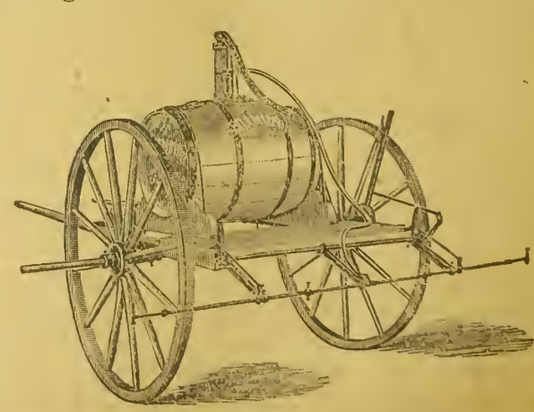
HORSE-POWER
POTATO SPRAMOTOR
Spraying 4 rows of potatoes, 3 nozzles to a row and 4 rows, 2 nozzles spraying the vines and 1 the tops. 12 nozzles operating at 150 lbs pressure

We Make Over 50 Styles and Sizes

There is a machine in the **Spramotor** line that will exactly fit your needs, whatever they may be. We sell a Hand **Spramotor** for as little as $6. This style will do all the work on a small farm. Then we have machines mounted on hand carts or on trucks, others horse-drawn, still others horse-operated. (the horse doing all the work except direct the spray) and finally we build the peerless model "C", a gasoline-power outfit for large farms and orchards.

Most of these outfits are interchangeable, that is, they can be adapted to tree spraying or row crop work by simply changing positions of the nozzles, They will also apply paint to barns, stables and out houses at half the cost of hand work in a tenth of the time. Dairymen find the **Spramotor** a money-maker when used to give milch cows relief from stinging and biting insects during fly time, as it will apply any fly repellant in a fine mist spray and give the animals that rest and comfort which means bigger yields of milk.

FREE By writing us stating your requirements in the way of spraying, you will get by return mail a copy of our valuable booklet on Crop Diseases, dealing with every known insect, scale and disease affecting trees, vegetables and grains. We will also forward full particulars of a **Spramotor** best suited to your needs, without any obligation whatever to you. Do it today!



The London Spramotor,

1722 King St. E.,

LONDON, CANADA.

Annual Meeting Maritime Poultry Association.

The annual meeting of the Maritime Poultry and Pet Stock Association, was held in the Board room of the Winter Fair Building, Amherst, Wednesday, December 10th, at 10.00 a. m. About thirty poultrymen were present. The president, Mr. Seth Jones, spoke of the improvement in the poultry show and the improved conditions of the industry in the Maritime Provinces. The minutes of the last meeting were read and approved The report of the Secy-Treas. was received and showed a balance on hand of $129.51 not including the returns of the show held this year. Mr. L. H. D. Foster reported for P. E. I., and stated that great progress was made and in particular the results of the egg circle movement was very gratifying to the farmers and poultrymen.

Mr. D. G. Stewart, of Dalhousie, stated that in New Brunswick things were coming better for the poultrymen. He paid a compliment to the management of the Winter Fair in the manner in which the show had improved, its cooping accommodations for fowls. J. P. Landry reported for the prize list committee and suggested to the members that the judges be supported in their system of disqualifying specimens of inferior quality in order to improve the quality of the poultry exhibited. It frequently happens that an exhibitor becomes dissatisfied if he does not receive a premium where there is no competition, when the specimen is in the opinion of the judge o, inferior quality. Mr. Seth Jones spoke in support of these suggestions and stated that the exhibitors should not place the blame on the judges but upon their own judgment in bringing birds of inferior quality to the show. The prize list was discussed at some length and it was moved by Mr. Craig and seconded by Geo. Callbeck, that in the dressed poultry class the section A. O. V. be changed to read "any other pure breed." Mr. Watson, the judge of the open classes complimented the exhibitors on the improvement in the show and stated that the exhibitors should give a little more attention to properly preparing their birds for the show, their exhibits would compare very favorably with those shown at Boston in many classes, particularly in the White Wyandotte and Rhode Island Red Classes. Mr. Reid, judge in the utility and open classes, stated that the show at present compared very favorably with the exhibit of poultry at Guelph, and gave a very interesting address on the different classes of poultry and the proper methods for preparing them for exhibitions. He stated that we were not in the Maritime Provinces, as keen in preparing our poultry for shows as the exhibitors were in Ontario. He believed, however, that poultrymen of these Maritime Provices would soon become as proficient in this as the Ontario exhibitors.

T. A. Benson, Dom. Govt, Supt. of Poultry for P. E. I., congratulated the Maritime Poultry Association on their show and strongly recommended that the fancy and utility breeds improve in unison, as there could be no separating the vigorous birds from those of weak constitution, if poultrymen were to succeed. Unless a specimen showed first all evidence of robust constitution it should not under any circumstances be awarded a premium. He also spoke very encourageingly of the work of organization and gave some samples of the results in Ontario and P. E. Island, which followed the organization of egg circles and poultry clubs. He deplored the fact that our farmers were too easily satisfied with the indifferent method of marketing the poultry products which largely prevails in the Maritime Provinces at present.

A discussion followed in which a good number of poultrymen took part as to whether it were profitable to breed purely exhibition poultry. A great many stated that it was a mistake to stick too closely to the standard without having regard to vigor and strong constitution.

The election of officers resulted as follows:

President—Seth Jones, Sussex, N.B.

Vice-Pres. for N. S.—Wm. Fanning, Amherst.

Vice-Pres. for N. B.—D. G. Stewart Dalhousie.

Vice-Pres. for P. E. I.—Geo. Callbeck, Summerside.

Director for N. S.—Thos. Munn, of Leitche's Creek.

Director for E. B.—Watson Lutz, Moncton.

Director for P. E. I.—L. D. H. Foster, Marshfield.

Prize List Committee—J. P. Landry, Seth Jones, L. H. D. Foster.

Delegate—I. C. Craig.

Substitute—L. H. D. Foster.

Before adjourning, a resolution was proposed and passed that in future all cross-breds be left out of the prize list.

Meeting adjourned.—J. P. Landry, Secy.-Treas.

Jersey Heifer in Record of Performance

The following three heifers have qualified for the Canadian Record of Performance yearly test: "Brampton Goldmont Jess" No. 806, owned by B. H. Bull & Sons, Brampton, Ont., bred by W. R. Spann, Dallas, Texas, age at commencement of test, two years two hundred and twenty seven days, total production, 6753 pounds of milk, 299 pounds of fat, equivalent to 347 pounds of butter. While making the test this heifer travelled the show circuit, being a winner at Toronto, Ottawa, etc. "Lady May of Pender" No. 1846, bred and owned by A. H. Menzies, Pender Island, B. C., age two years, produced 8177 pounds of milk, and 413 pounds of fat, equivalent to over 480 pounds of butter. "Priocess Flo of Edgeley" No. 1603, sire "Brampton Blue Beam" dam "Sunbeam of Edgeley" a Record of Performance cow, bred and owned by James Baggs, Edgeley, Ont., age three years one hundred and twenty days, produced 10838 pounds of milk, and 598 pounds of fat equivalent to over 696 pounds of butter.

Good Poultry in P. E. I.

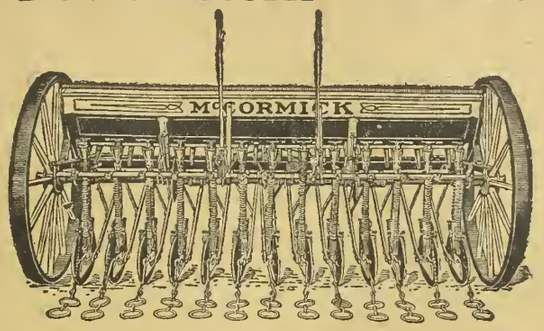
Mr. T. A. Benson, Dominion Poultry Representative when forwarding the reports of the P. E. I. Poultry Show, which appeared in our last issue said.

"As requested by your favor of Dec. 23rd I am sending you a full prize list of the Prince Edward Island Poultry Show, and also a little write up which I think justly describes the show without exaggeration.

"I was present at the show the previous season and was certainly struck with the wonderful improvement shown in all classes this year.

"As you may know I am representing the Dominion Department of Agriculture in poultry interests in P. E. Island and I was particularly pleased to see that some of the members of the fourteen egg circles which we have organized here were successful in carrying off a large proportion of the prizes, I must admit that although I have been around the country fairly well now, I was somewhat surprised at the excellent quality of these utility birds."

McCormick Drills For Eastern Canada



A McCORMICK drill prepares the best possible seed bed, and McCormick drills are longest-wearing. Any man who owns one of these implements will assure you that these are facts. When you buy a drill, buy a McCormick.

McCormick single disk and hoe drills have continuous axles, strong, light, thoroughly braced frames of angle steel, and durable, wide running drive wheels. They have a double run force feed which adapts them perfectly to the sowing of all kinds of seed.

Bearings are simple, as nearly as possible dust-proof, and easily oiled. Grain boxes are of large capacity, and they are too firmly supported to allow sagging.

See McCormick drills at the nearest I H C local agent's. All their features are explained in our catalogues. Get catalogues from the dealer, or drop a line to the nearest branch house.

Women's Institutes.

(Continued from page 325)

totally different things—housekeeping is an important part of homemaking but a good housekeeper may not possess the first fundamental idea of homemaking. Housekeeping is the art of keeping a house clean, tidy and of serving good meals and probably someone will say there is nothing more. But that is not all. Have you ever gone into a house where you were afraid to sit back in a chair in case you would put a dent into a cushion that was intended for show and not for comfort, where you felt that you could not move a chair one inch out of place in case your hostess would give you a reproachful glance, when everything was so painfully neat that it hurt; where you would never be asked to take pot luck but everything must be prepared beforehand ere you are asked to break bread with the family. The son cannot ask his friends in because they bring in mud and the daughter seeks her friends' houses for amusement but never thinks of asking her friends to her mother's house as for the man of the house if he does not take a glass for comfort occasionally can you blame him? That's housekeeping but not homemaking which is so vastly superior to you that you know a home whenever you enter the door. It does not need to be an untidy house but there is an air of welcome and every article of furniture is intended for use and you are given just what the larder affords even if it be only tea, bread and butter, but it is served with such true hospitality that you prefer it to a turkey dinner at the first house. Way back in the Old Testament times, that wise old king, Solomon, knew the difference between homemaking and housekeeping and gave his decision in favor of homemaking when he said: "Better a dinner of herbs where love is than a stalled ox and hatred therewith."

Housekeeping is not all of homemaking but the two should work together in harmony to turn a mere structure of stone or wood into the nearest glimpse of Paradise we are given on earth, a home.

FOR HOME AND COUNTRY.

The first and principal work of the Institute is home work. Its motto is "For Home and Country." There are many reasons why it should have work come first and I would like to tell you a few of them. These are not my opinion only but of men and women who have made a life long study of agriculture and were therefore competent to speak on the matter and these are some of their statements:

"That half a million lives are cut short and five million people are made ill by "preventable diseases" every year. With universal knowledge of hygiene and sanitation nearly all deaths and illness from such causes could be prevented. That six hundred thousand infants under two years end their little spasm of life yearly, while millions of children fail to reach their best physical development because their fathers and mothers do not understand how to care for them in the light of science. That the upbringing of children demands more study than the raising of chickens but very often the chickens get more care, with more knowledge, at least, than half the number of babies and the physical standard raised immeasureably. That thousands of homes are wrecked and lives are ruined and hundreds of thousands are made unhappy because the homemakers of our country have no training in the greatest of all professions, the profession of home making and only through such education can present domestic difficulties be solved and the modern home contribute all that it should to happiness and well being. That all must live in some sort of home; that everyone finds his chief happiness there; that character is developed there; that no great advance, spiritual or material, is possible which does not begin with the home; that the homemakers of Canada have the making of the Nation. That on the breadth and strength of the base depends the height of the pinnacle, on the home of foundation, we rear the pinnacle of all that is good in state and individual."

QUALIFICATIONS OF HOME MAKER.

There is one sentence there that I would like to enlarge upon "The homemakers of our country have no training in the greatest of all professions." How many of you would take the sick of your household to a man that was not qualified and did not possess the necessary Doctor's degree. You demand a certain period of apprenticeship or technical training from any man before you give him a responsible position; you see to it that he is fit for the work he undertakes. Now just as much as a man requires training for this life work does a woman require training for hers and much more because her work is more important. But the average young woman does not get any training which is necessary and too often she enters married life with a vague idea that dinners must be provided and the house cared for and she cherishes a vain hope that a knowledge of such matters will come somehow by instinct, intuition or happy accident. Would you men trust a valuable horse to a man who assured you that he never had shod a horse but his father was a good blacksmith and so was his grandfather and he guessed he could shoe any old horse alright. If you would, then you are no horseman and any old horse is the kind of horse you deserve to own. Lucky horse if his feet survived amateur shoeing and I say lucky woman if she reaches the shoes of knowledge of all that pertains to home making without wrecking all her hopes of earthly happiness. She will finally realize that the responsibilities of health and happiness, life and death are in her incompetent hands. The duties handed down from mother to daughter are not sufficient day needs. Let me tell you a few of the things a woman needs to have some idea of to manage a house. She should know how to spend money wisely because the wisdom of her management of the money disbursed depends upon the financial prosperity of the family. She should have a knowledge of the laws of health; an understanding of the sanitary requirements of the house; she should know a great deal about the value it affords as to cost and nutrition. Did you ever hear of balanced rations in relation to the proper feeding of stock in your barn. The principles underlying the balanced rations can be and should be applied to the proper feeding of the human stock in your home. The diet makes a lot of difference in your daily attitude towards mankind. The proper selection and preparation of food has more to do with the welfare of mankind both mentally and physically than we think. "We eat and live" is the correct attitude all right but if we are forced to maintain life by eating things that do not agree with us life seems a very indifferent thing. We view our neighbor and the people in general with a distorted vision and the whole world is out of joint. It isn't the poor old world at all it is just because the mother, wife or sister who runs the particular spot where we hang our hat chance to have a dish for the last meal that didn't agree with us and as a conse-

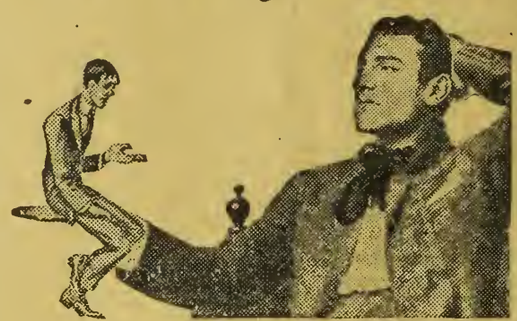
86 Pages of Personal Advice

Free To Any Man

MY DEAR READER:

In the handsomely printed little book or private pocket compendium for men (containing 8,000 words and 40 half-tone photo reproductions), which I publish and gladly forward by mail, free, sealed to any man anywhere in the world who sends me the free coupon below. I have included certain parts that contain some very important advice or suggestions of a strictly personal nature which, I believe, cannot be found in any of the Private Hygiene books for men that are now sold at high prices all over the country. It will thus be seen I have endeavored, through the medium of my free book, to give my readers absolutely free of cost really MORE, in some respects, than others offer and make a large charge for. All you have to do to get this free book of mine is to use the coupon below, or if in my neighborhood, I extend an invitation to you to call at my office. Please remember that this free offer involves absolutely no obligation on your part, and there is nothing whatsoever for you to pay and nothing whatsoever for you to buy in any way, unless you should decide at some time in the future that you would like try one of my mechanical VITALIZERS (described below). but that rests entirely with yourself. Over a million of these little free books have now been sent to men who wrote for them as I want you to do, and who live in all parts of the globe. I publish this free book in English, Swedish, Danish, Finnish, German, French and Polish, bnt I always send the English edition of course, unless otherwise instructed. Kindly use the little coupon.

SANDEN, AUTHOR.



MANLY, VIGOROUS MEN RULE THE WORLD

In reference to manly strength, I believe it is now more generally acknowledged than ever before that the manly man stands back of all that makes for progress, development and achievement in the world, a truth which any of us can easily verify if we but look about us with impartial eyes.

As a matter of fact, the man who is debilitated, unstrung and enervated cannot, for perfectly obvious reasons, expect to approach those real and masterful attainments which seem but a natural and easy accomplishment for him whose nerve force, brain power and manly strength are perfectly normal. Hence, we acknowledge the debilitated, weakened man to be handicapped in every walk of life where real manhood counts, yet it would indeed be cruel of me to here so state the fact in public print were I not of the honest opinion that there is every hope for the unmanly man to restore himself to a state of health and vigor, if he but clear his mind of abnormal fear, and then make a fair, square effort to redeem himself.

There are two specimens of humanity for which I have no earthly use. One is the man who, though now strong and vital, yet plunges into dissipation and excess with the certain knowledge of his unmanly fate. The other is the man who, though knowingly debilitated and enervated, makes no effort to get away from his life of dissipation and wrong practices. As a matter of fact, there is no hope for either of these unfortunates But for him who acknowledges his errors, who may come to me and say, "I have paid the penalty of my past follies, but I am THROUGH with my life of dissipation, and I am going to make a manly effort to restore myself," to such a man, I carea not what his physical condition may be, I can say in all truthfulness, "You, my friend, are on the right road to new strength and new manhood", for he really is, and there is no doubt about it.

I make a little appliance that I call a VITALIZER, which I designed to aid just such men who seek manly strength. I am not offering this VITALIZER here for sale, but merely suggest that you, reader take this opportunity to learnall about what this little appliance is doing today everywhere throughout the world; then, if in the future you want to use one yourself and will so write me, I will gladly make some liberal proposition whereby you may have one to try. The VITALIZER is fully described in one section of the free book which the coupon below entitles you to.

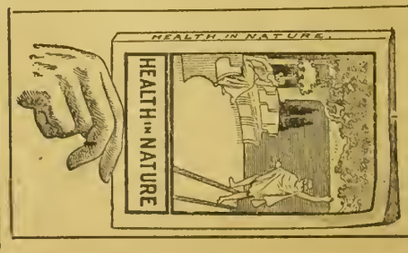
The VITALIZER is made up in a very light form weighing only several ounces, and you wear it on your body all night. It generates a great, soft, pleasant FORCE which I call VIGOR, and which flows in a continuous stream into your nerves. organs, blood and muscles while you sleep. I am satisfied in my own mind that I have access to a great POWER in this little VITALIZER which in the future will be more and more relied upon all over the world in the treatment of debilities and nerve weaknesses.

With special attachments which carry the FORCE of the VITALIZER to any part of the body, it may be used by women as well as men for he treatment of rheumatism, kidney, liver, stomach, bladder, disorders, nervousness, lack of energy, etc. Therefore, please send for the book today, or if you happen to live in or near this city, I should be very glad to see you in person. Office hours, 9 to 6.

WHAT THE FREE BOOK TEACHES YOU

The little free illustrated book of special private information, referred to above, is meant really to be a self guide for all men through the years before and after marriage and onward to a ripe old age. It is written in perfectly plain language, entirely free from technical terms, so that any one may easily grasp the full power of its good advice from two or three careful readings. It attempts to point out a safe road to new manhood or new manly strength, and as such is dedicated to mankind generally. One part of this book fully describes my little VITALIZER referred to above.

Remember, as soon as the coupon below is received I agree to forward to you one copy of this illustrated booklet, absolutely free of charge and in a plain, sealed envelope, so that it will come to you privately, just as you receive any sealed mail.



DR. M. F. SANDEN CO.,
140 Yonge St., Toronto. Ont.

Dear Sirs Please forward me your book, as advertised, free, sealed.

Was Troubled With Weak Back.

Weak back is caused by weak kidneys, and it is hard for a woman to look after her household duties when she is suffering from a weak and aching back, for no woman can be strong and well when the kidneys are out of order.

Doan's Kidney Pills go right to the seat of the trouble, cure the weak, aching back, and prevent any and all of the serious kidney troubles which are liable to become deep rooted into the system if not attended to at once.

Mrs. Augustus Jinks, Demorestville, Ont., writes:—"For several years I had been troubled with weak back and kidneys. I had terrible dizzy headaches, and could not sleep at night. A friend of mine asked me to try Doan's Kidney Pills, and I did so, and in a short time was cured."

Doan's Kidney Pills are 50c. per box, 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

If ordering direct specify "Doan's."

quence we suffer and cannot be comfortable alone so being of a generous disposition we pass on the uncomfortableness and make it general. I am afraid I have strayed from the list of things. I was going to tell you what woman needs to know before she is really competent to manage a house so as to make it a home. They are simply endless. She has to be a doctor, a lawyer, a minister, a nurse, a cook, a housemaid, a stocker, a plumber, a carpenter (and that's all nonsense about a woman not being able to drive a nail straight) and she will do more odd jobs around the house with a hairpin than you ever dreamt of; probably the most of them she asked you to do and you said you would send the carpenter or the plumber or whichever particular one of the trades was required for the job, then you forgot, so the hairpin with the assistance of the poker and a three pronged fork did the business and it never cost you a cent and that's all there was about it. Well there is hardly any trade or profession that the real homemaker does not know something about but one is usually all you men can master. Now in the Institute we want to discuss all these various phases of work, bring new light and knowledge to bear on them and minimize them and make them as interesting as possible; to make them easier and simplier by utilizing methods and modern utensils and introducing machinery to do some of the work that tired and overworked hands have done in the past. I remember once that if women were forced to leave their homes for a few weeks and the men had to do the work the women would return to find the men sitting on the fence smoking while the housework was being done by machinery. I believe that if men had to sweep carpets and rub up all over the house there would be sudden demand for vacuum cleaners and many other modern improvements would suddenly be regarded as actual necessities and not as extravagant luxuries. After all the value of any article depends upon the point of view; yours or mine, or just what particular toe the shoe pinches hardest. While the Institute aims to help the homemaker who has perfected the conditions in her home so they are best suited to the growth, development and happiness of its inmates she is not going to allow the conditions in the community surrounding her home to be anything but the best.

INSTITUTE INFLUENCES.

You would hardly think that the Institute formed some six months ago in Nova Scotia would have accomplished any work but the reports read at the Convention the week before last were little short of marvelous. One Institute tidied up a cemetery that had long been in need of it and is now busy considering ways and means of providing the village with sidewalks. Another provided all the schools within a radius several miles with sanitary drinking fountains. Another gave a Hallowe'en entertainment and presented a hospital in a neighboring town with a nice little sum of money. Another held two special meetings at which many useful garments were made of material furnished by Institute members and at Christmas these were distributed with toys and books among the less fortunate in the district and boxes containing cake, fruit and small gifts were sent to the County Poorhouse. There were many small things done by other Institutes quite as important and quite as helpful, but I am only mentioning the outstanding achievements. When so much has been done in such little time what will the Institutes do in the years to come when they have had time to develop number and strength. Now just a word more — The Institute is strictly non-sectarian and non-partizan and any woman is welcome from the age of fifteen up there is no age limit. The oldest woman in the community and the youngest may belong and meet on common ground in the interests of the home and country.

There are a few things we would like the men to do—there are times when a man is a handy thing to have about and sometimes he is very useful. We ask for your interest and co-operation and would beg you to tell your women folk when you go home about this new society so that when we come to your district if there is not an Institdte organized there already, we may find that someone has spoken a kind word on our behalf. If need be we ask for something more than kind words, an interest of a more substantial nature. I feel sure we will not ask in vain and I think you will find a renewed interest in the Agricultural Societies will follow the introduction into any district of a Woman's Institute.

Eureka Potato Planter

Catalog sent free

No matter whether you grow large or small quantities of potatoes we have a size of planter that is just what you need. The Eureka line of Potato Planters is the largest manufactured. This machine takes only *one* man to operate it. That means less trouble and expense for *you.*

Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if desired)—covers up—marks for next row.

It's an easy machine to operate. The steel and malleable iron construction mean lightest possible weight and increased life of machine. Your repair bill will be practically nothing. Plants uniform depth at *all* times because plow is directly under the axle. Dropping mechanism in plain view of driver. Does not injure seed.

We supply planters in three sizes, for one or two rows—with or without Fertilizer Attachment.

For 15 years the Eureka Potato Planter has been successfully used throughout the world.

We also make Eureka Potato Cutters and the Eureka Mulcher and Seeder—a mulcher, smoothing harrow, cultivator, weeder, seeder.

Make Your Stock and Poultry Pay Better with Royal Purple

STOCK AND POULTRY SPECIFICS

At a cost of less than a cent a day per head of stock, it will increase their value 25 per cent. Permanently cures Colic, Debility, Worms, Bots and Skin Diseases. Tones up run-down animals so that they quickly gain weight and vigor. Increases the yield of milch cows three to five pounds a day, besides enriching the quality of the milk.

ROYAL PURPLE is not a food. It is a conditioner—the best ever so'd. If there was any better we would be making it. It enables your stock to eat the natural food they should eat and get the most benefit from it. Here is the advice of all thorough veterinary doctors—"Feed your stock on food of your own growing"—not pamper them with soft predigested mush so that after a time they cannot digest good, wholesome feed. Feed the good food grown on your own farm—hay, oats, bran, chop, etc. You know what these things cost you and what they will do.

ROYAL PURPLE is an aid to these natural foods and if you use it as directed, we can guarantee better results than if you feed any of the concoctions offered on the market as "prepared foods."

Try It On a Poor-Conditioned Animal

If there is a run-down, poorly nourished beast on your farm, see what **ROYAL PURPLE SPECIFIC** will do for it. A 50-cent package lasts a cow or horse 70 days. The cost is so trifling that no farmer in Canada has any excuse for having out-of-health stock around his place. Try it on the poorest-conditioned animal you have and we know you'll be surprised at the result of a short treatment. Cattle and hogs fatten up a month earlier than without it, which means you save a month's feed and a month's labor. You can bring six pigs to the pink of condition at the cost of $1.50. Steers treated in the same way cost no more than $1.00 each to put in prime state for market. **ROYAL PURPLE SPECIFIC** fattens and keeps well horses, mares, colts, cows, calves, steers, hogs. Sold in packages, 50c, and air-tight tins, $1.50.

Try ROYAL PURPLE POULTRY SPECIFIC on Your Hens

Do you know that **ROYAL PURPLE POULTRY SPECIFIC** makes hens lay in winter as well as in summer, and keeps them free from disease? It does, and helps them over the moult, fattens and keeps them in vigorous health. A 50c package lasts 25 hens over 70 days. Shouldn't you try it? We have hundreds of recommendations from all parts of the country. If **ROYAL PURPLE** does not give you better results than anything you ever used, or give you satisfaction, we will refund your money. No matter what your opinion of other preparations, we want you to give **ROYAL PURPLE POULTRY SPECIFIC** a chance to show what it can do for your poultry—and a 50c package will show you some fine results. Sold in 25c and 50c packages and $1.50 air-tight tins.

WE ALSO SELL

Royal Purple Cough Specific for cough and distemper. (Will cure any ordinary cough in four days). 50c, by mail 60c.

Royal Purple Sweat Liniment for lameness, rheumatism, sprained tendons, etc. 50c, by mail 60c.

Royal Purple Worm Specific for animals; removes the worms, also their larvae. 25c, by mail 30c.

Royal Purple Disinfectant, in 25c, 50c and $1.00 tins.

Royal Purple Lice Killer for poultry and animals. 25c and 50c, by mail 30c and 60c.

Halifax Market Prices

A fair amount of business is moving in the wholesale produce trade at the present time, and prices are firm.

Potatoes have had an advance of 90c per half bag.

Another month or so will see this market practically bare of apples. No 1 apples are now worth $5.00 a barrel while it is probable that any offerings in the latter part of March will bring $6.00 per barrel.

GRAIN.—Oats, bulk, 47c 50c; Peas, $7.00.

FEEDSTUFFS.—Bran, $26 to $27; Shorts, $27 to 28.; Middlings, $28 to 29.00; Linseed Meal, 40.00 to 42.00; Cottonseed Meal, 37.00 to 39.00; Gluten Meal, 32.00 to 34.00; Corn Meal, 1.65 to 1.70.

GRASS SEEDS.—Timothy, 8c to 12c; Com. Red Clover, 19c to 24c; Mam. Red Clover, 20c to 21c; Alsike, 19c to 22c.

DRESSED MEATS.—Beef (carcass), 7c to 12½c; Hogs, 9c to 12c; Mutton, 8c to 9½c; Veal, 8c to 10c.

HORSES.—Drafters, 250.00 to 300.; Roadsters, 200.00 to 250.00; Carriage, 175.00 to 200.00.

DAIRY PRODUCE.— Creamery Butter, 31c; Dairy Butter, 28c; Cheese, 16c.

POULTRY AND POULTRY PRODUCTS.—Eggs, 30c; Fowl, 15c to 18c; Chickens, none offering; Ducks, 18c to 20c; Geese, 17c to 20c; Turkeys, 22c to 24c.

FRUIT.—Apples, 2.50 to 5.00; No. 1 Baldwin, 5.00; No. 2 Baldwins, 4.00; No. 3 Baldwins, 2.50; No. 1 Spy, 5.00 No. 2, Spy, 4.25; No. 3 Spy, 2.50; No. 1 Golden Russet, 5.00.

MISCELLANEOUS— Hay 16.00 to 17.00; Wool, 25c to 27c lb.; Beef Hides, 12c to 13c; Calf Skins, 18c to 20c lb.; Sheep Skins, 75c to 1.50.

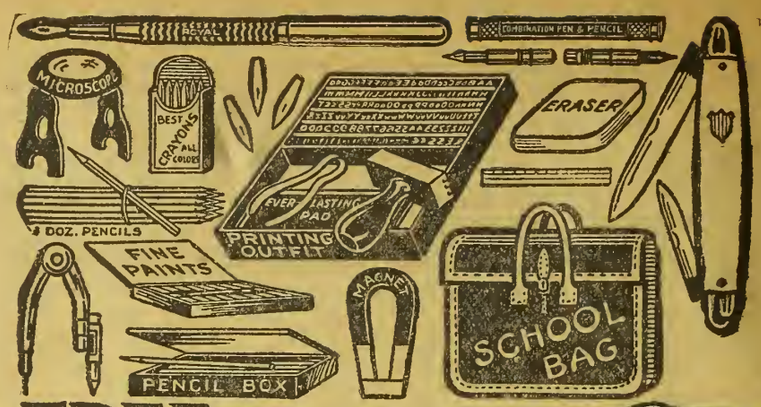
VEGETABLES—Carrots, 2.50 bbl.; Potatoes, half bag, 90c; Turnips, bag 1.25; Onions, bag 3.00; Parsnips, bbl., 2.00; Cabbage, doz., 1.00.

Bred to, or Served by.

Which is the proper statement to make concerning a cow you sell, that she is bred to a certain bull, or that she has been served by that bull? I have just sold two heifers that were mated with my bull in December, and as yet I am not sure they are with calf. Which is the safe way?

Reply: To be absolutely safe in the case of mating your cow with a bull it will be best to say that she has been served by that bull on a certain date. The American Jersey Cattle Club on their transfer certificates, in stating condition of cows at time of transfer, refer to them as having been or not served. The term bred to, as scientific reasoning contemplates it, guarantees the cow to be with calf by that bull at the time of transfer. This in many cases can be determined pretty well, but in the case of recent date of service we have no assurance that the cow is holding to the service and is in reality bred to that bull. The mere mating of cow and bull does not guarantee that she is bred, and in that case to be safe it is best to state that the cow was served on that date by that bull.—Jersey Bulletin.

Making every acre more profitable, making every acre yield a larger crop is the solution of increasing the size of the farm.



FREE Grand 28-Piece Scholar's Outfit and a Dandy Big Camera

THE GREATEST PREMIUM IN CANADA—EASY TO GET

BOYS AND GIRLS—We want to give you, without a cent of cost, this magnificent scholar's outfit, so complete and handsome that you will be the pride of the school. **JUST READ WHAT EACH OUTFIT CONTAINS**—One high-grade largest size English school bag, one fine Royal fountain pen with three extra gold finished nibs, one all steel, silver-finished pen knife, one combination safety pen and pencil, a big, complete printing outfit with six rows of type, one dozen (12) high-grade lead pencils, a fine pencil box with lock and key, a microscope or magnifying glass, one box of fine crayons, one tin box of fine paints containing 26 colors, one horse-shoe magnet, one school compass, one 12-inch ruler, and last, but not least, a fine eraser. We arrange to stand payment of all transportation charges. Don't miss this chance. Write today. Be first. Address

THE REGAL MANUFACTURING CO. DEPT. O. 46 TORONTO, ONT. 31

All the editors are telling you to sell the boarder cows, but a great many forget to tell you that you ought to find out for sure whether your cows are boarders or not. Many boarders would pay a profit if the keeper would just simply give them a chance.

The hog house should be well ventilated and it should have an abundance of sunshine. These two things are very important but they have been overlooked in many of the buildings that have been put up in the past.

POPULAR FENCE 40c PER ROD

These Fences are a splendid value, and excellent general purpose fencing. They will turn either poultry or animals. Read below the close spacing of line wires and uprights, and by stretching single strands of wire above can be made as high as desired.

70-384. Height 48 inches, 14 line wires, uprights 8 inches apart, top and bottom wires No. 9, line wires No. 12, stays No. 13. Price, per rod, freight paid.. **40c**

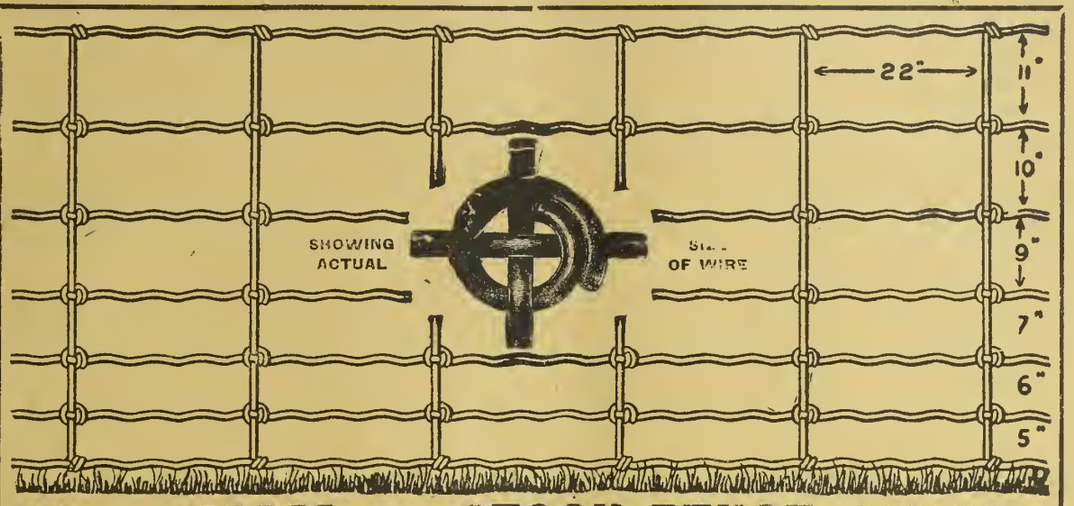
70-385. Height 36 inches, 10 line wires, uprights only 6 inches apart, or 33 to the rod, top and bottom wires No. 9, line and stay wire No. 13. Price, per rod, freight paid..... **34c**

SOLD IN 20, 30 AND 40-ROD ROLLS.

HOG AND SHEEP FENCE 26c PER ROD

It is a hog-tight fence, with the upright stays 12 inches apart. Height of fence is 34 inches. It has 8-line wires. Top and bottom wires are No. 9, with No. 12 filling, heavily galvanized. Sold in 20, 30 and 40-rod rolls.

70-360. Price, per rod, freight paid..... **26c**



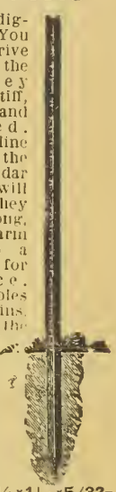
24c PER ROD FARM AND STOCK FENCE 7 LINE WIRES 48 INCHES HIGH

A strong and serviceable fence, a popular height, and easy to erect. Is made of No. 9 hard steel wire, fully galvanized and tightly interlocked. This fence is heavy enough for general purposes, and tight enough to turn the worst animal. Stays are rigid, and 9 to the rod, being 22 inches apart. Sold in 20, 30 and 40-rod rolls.

70-367. Price, per rod, FREIGHT PAID ANYWHERE IN QUEBEC OR MARITIME PROVINCES..... **24c**

STEEL FENCE POSTS

They save digging holes. You simply drive them in the ground. They are made of stiff, tough steel, and are pointed. A splendid line post, taking the place of cedar posts, and will last longer. They make a strong, neat job of farm fencing, also a fine post for garden fence. They have holes punched 2 ins. apart to fit the spacings of any fence and are painted. Wires are fastened by a loop of soft wire put through holes and twisted back of post.



70-399. 1¼x1¼x5/32-inch, 6 feet 8 inches long. Price **33c** Heavier, and longer posts.

70-400. 1½x1½x3/16-inch, 7 feet 2 inches long. Price **47c** Freight paid in lots of ten or more.

20c PER ROD 42-INCH HEAVY FARM FENCE

An extra heavy and strong fence. It is high-grade, reliable fencing at a very low price. The knots lock the stays so tightly to the line wires that they cannot slip or spread, and the line wires cannot move up or down. This fence will turn the ugliest and strongest animals. Wire is all hard steel, No. 9, and heavily galvanized. Stays are 22 inches apart, or 9 to the rod. Read fence information below. Sold in 20, 30 and 40-rod rolls.

70-355. 5-line wires. Height 42 inches. Per rod..... **20c**
70-356. 8-line wires. Height 47 inches. Per rod..... **29c**
70-357. 9-line wires. Height 51 inches. Per rod..... **34c**

Same Heavy-weight Farm Fence, with closer stays, being 16½ inches apart.

70-353. 8-line wires. Height 47 inches. Per rod..... **32c**
70-359. 9-line wires. Height 51 inches. Per rod..... **37c**

Freight paid to your station anywhere in Quebec or Maritime Provinces.

MEDIUM WEIGHT CLOSE FENCE, 23c PER ROD

This is a most serviceable and popular style of fencing. It is thoroughly and completely galvanized, and we use a No. 9 wire for top and bottom lines, with a No. 12 wire filling. There are 15 stays to the rod, being only 13 inches apart, making it a close mesh for general use. A durable and tight fence. Sold in 20, 30 and 40-rod rolls.

70-371. 6-line wires. Height 40 inches. Per rod, freight paid..... **23c**
70-372. 10-line wires. Height 50 inches. Per rod, freight paid..... **35c**
Staples, 1¾ ins., galvanized. About 65 in a lb. Sold only in bags of 10, 25 and 50 lbs.
70-368. Price, per pound..... **3½c**
Brace Wire of soft, pliable steel, galvanized, No. 9 size, sold only in 25 and 50-lb. coils.
70-387. 25 lbs..... **85c** 50 lbs..... **1.70**

FREIGHT PAID ON STAPLES AND BRACE WIRE IF BOUGHT WITH FENCING.

12-FOOT STEEL GATE, 3.95

Freight paid anywhere in Quebec or Maritime Provinces

Strong Farm Drive Gate, the frame is heavy tubular steel, perfectly welded by electrical process, and the filling is No. 9 galvanized wire. The frame is rigidly braced, and painted black. Latch and hinges are supplied with gate. Freight paid to your station.

70-374. Each, freight paid to your station..... **6.90**
70-408. Lighter, but powerful Stretcher, for average use. Price, freight paid..... **5.40**

READ THIS

Wire is made in sizes such as 8, 9, 10, 11, etc. These gauge numbers run higher as the size of wire is smaller. For instance: A No. 10 wire is smaller than No. 9. Most of the wire used in this country is imported from the United States and England, and the gauges are different in each country. These gauges vary enough to confuse the sizes of wire, though hardly noticeable unless measured with a micrometer. An English No. 9 is smaller than American wire of same gauge, and an American No. 10 is equivalent to No. 9½ Canadian size, the Canadian No. 10 being smaller. But no half sizes are stated on the scale of gauges, and half sizes are not recognized by the customs officials. There is no uniformity in wire sizes. The conditions of manufacture also are such that the dies through which wire is drawn are made smaller when new to allow for wear, and the wire varies in size as the die wears. We mention these facts to show that an exactness in fence wire does not exist. We insist on our fence wire being as uniform as possible, and not smaller anywhere than half the gauge difference, and we do not use any No. 10 wire at all in our heavy fence. We use what is known as No. 9, and we stipulate that this must not be smaller than No. 9½ at any point. This makes a farm fence that is heavy and very strong in every part of it, and up to a definite standard. The strength is in this heavy, hard, steel wire, and the life of the fence is in the galvanizing on the wire. Our fence is thoroughly galvanized with an even coating. We will send a sample piece of wire upon request.

5.35 DOUBLE DRIVE GATE

Freight paid anywhere in Quebec or Maritime Provinces.

A very attractive and strong steel frame gate, with a filling of 2-inch diamond mesh No. 13 galvanized wire. They are substantial and chicken-tight, as well as attractive gates. We supply hinges and fasteners, complete with hook for holding centre, so that one gate can be used at a time if desired. Each gate has artistic iron scroll on top, painted black.

Here is a message of hope and good cheer from Mrs. C. J. Martin, Boone Mill, Va., who is the mother of eighteen children. Mrs. Martin was cured of stomach trouble and constipation by Chamberlain's Tablets after five years of suffering, and now recommends these tablets to the public. Sold by all dealers.

Preventing Sows from Eating Pigs.

A sow is very often induced to eat her pigs through a craving for protein which is not being supplied in sufficient quantity in her ration and which is present in a high degree in the body of the pig. Over-feeding just before or after farrowing may develop a feverish condition resulting in an abnormal appetite which causes the sow to eat her pigs. If pig-eating has become a habit about the best thing to do is to dispose of the sow. On the other hand, one can usually prevent a sow from developing such a habit by proper feeding. One offence cannot said to be a habit, and it may be possible to prevent the sow from eating her pigs in the future.

Before the sow farrows she must be supplied with feeds sufficiently rich in protein, not only for the upkeep of her own body, but also for the development of the pigs she is caressential for the production of milk as well as for the upkeep of the body.

Such feeds as tankage, meat meal, wheat shorts and skimmilk are high in protein. The proportions by weight of 1 pound of tankage or meat meal to 8 pounds of corn or rice bran constitute a good ration for the brood sow. In addition she should be provided with green grazing of some sort such as oats, alfalfa or burr clover. If the grazing is alfalfa or burr clover tankage or meat meal will not be needed in the ration. She should receive a sufficient quantity of feed to keep her in good thriving gaining condition during the period of pregnancy.

A few days previous to farrowing the sow should be comfortably located in the place where she is to farrow, and her feed should be reduced to some extent. If she has previously been on such grazing as did not require some such feed as tankage, meat meal, wheat shorts or skimmilk, one of these feeds should be substituted for some of the corn or rice bran in order to continue a sufficient supply of protein.

After farrowing a sow should not receive any feed for about twenty-four hours, though she should have free access to water. The first feed should be light, as a slop of wheat bran. Several days should be taken in gradually getting her back to full feed, the object being to feed so as to produce no more milk than the pigs can well take. Green grazing should constitute a portion of the ration after farrowing as before, if the best results are to be obtained.—John C. Burns, Texas Experiment Station.

Too many farmers spend good money for Babcock testers and other implements of that kind, then store them away in the barn or on the shelf in the milk house and forget entirely how to use them. The tester, if it is going to be good, must be kept in use.

There should always be a little leisure on the farm. I know there are periods when the season is very much behind when one is rushed to the limit, but these should be brief as possible. It is far better to hire a little extra help for a few days than to be a slave to your work for weeks and months and to have things behind to such an extent that it is impossible to be your own boss.

The difference between success and failure on the farm, just as it is everywhere else, is a difference in method and application. It takes more than mere muscle and main strength to run the farm successfully.

DEALERS WANTED

The very active interest taken by farmers throughout the Dominion in better methods of fertilizing, has created an astonishing demand for Davies Special Mixed Fertilizers.

As we want to supply this demand through dealers, we are offering an attractive proposition to reliable parties in Ontarin, Quebec and the Maritime Provinces, who can handle quantities of 20 tons (minimum carloads) or more. This proposition is open to anyone, whether regular fertilizer dealers or not.

It offers a very profitable side line for Seedsmen, Implement Dealers, Flour and Feed Men, Millers, and progressive Farmers, in districts where we are not at present represented.

DAVIES SPECIAL MIXED FERTILIZERS

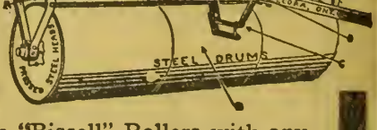
have an extremely good performance record, having produced remarkable results for many farmers. They are prepared by using only the highest quality materials and are mixed under the supervision of experts. They are put up in 125 lb. bags (barrels if desired).

Goods are guaranteed to be in perfect condition.

We especially recommend our factory mixed high-grade fertilizers analyzing from 6 to 10% POTASH.
This is a splendid opportunity. Write us immediately about it before all the remaining territory is taken up.

The William **DAVIES** Company Limited
West Toronto, Ontario.

"Bissell" rollers are a specialty



The "Bissell" Rollers are built by men who have made a life study of this work, and are SPECIALISTS IN THE BUSINESS. Search as you may, there are no such perfect Land Rollers on the Continent as the "Bissell." Make a note of these points and compare the "Bissell" Rollers with any other Land Roller in America. If the "Bissell" does not convince you that it is the best Roller, then don't buy, but you ought to know the facts, and it will do any person good to make the comparison. No need to send special travellers to sell "Bissell" Rollers. Practical farmers see the difference and prefer the "Bissell."

The 18 cold rolled anti-friction Bearings ½ inch thick with lathe cut ends, held in the one piece Malleable Iron Cage, is a single point placing the "Bissell" Roller away ahead.

Look for the name "Bissell" on every Roller. No other is genuine. Ask Dept. M for free catalogue. 61

T. E. BISSELL CO., ELORA, ONT.

FLORICULTURE.

Hampton, writes:—During the recent cold snap I unfortunately had my plants severely frosted. They consisted principally of Geraniums, one Calla Lily and an Oleander Heliotrope which looks entirely dead, and a few small foliages. What shall I do to save the roots if they can be saved.

First cut off all blackened and discolored wood and foliage. Then place in light but no sun for some little time. Water sparingly and keep at a moderate temperature. As soon as the foliage starts to grow again give sunlight and treat as before. The Calla will probably come all right. The Heliotrope would likely die also the Coleno which are what I presume are meant by foliages. Many times, if plants are not badly frozen, a complete submersion in cold water before they have started to thaw will save hardy varieties. This is worth remembering.

Freezia, writes:—I purchased bulbs last fall and planted them as directed but am sorry to say that they have wilted down almost flat on the soil yet they look healthy and the buds are appearing all right. Can I do anything to save them?

This is the natural habit of growth of this bulb and I hardly think there is anything the matter with them. You will find they will bloom all right as they are.

H. P., of Hampton, writes:—I have an Easter Lily plant about one and a half feet high. It has four small buds just appearing about the size of beans. The leaves are beginning to curl and have streaks of yellow through them. Will it be too early for Easter? How should I treat it to make it bloom then? I am very anxious to have it bloom for Easter Sunday.

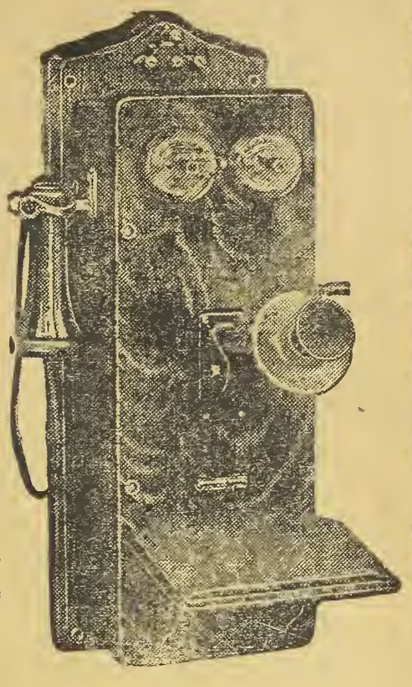
You certainly have your plant quite well advanced for Easter bloom It must be in a warm tunny place. I would imagine it should be kept as cool as possible, that is in a temperature of say 60 degrees, in order to hold it back. However, you can tell better a month from now how to treat it. Let me hear from you then. The curling, yellow-streaked leaves are not a good sign. It sounds very much like the Bermuda Lily disease that is almost impossible to do anything with. However, it does not always kill the plant only makes the foliage look badly. We have very seldom seen it in plants for a few years back. The growers seem to have got the better of it. When the bud is affected with it, it seldom produces a perfect flower.

Noble of Oaklands.

Readers of the periodicals which give any prominence to agricultural matters noted that in May 1911, Noble of Oaklands, perhaps the most celebrated Jersey bull in the world up to that time, was sold in his six year old form for fifteen thousand dollars. His dam, a cow of thirteen years, on the same day sold for seven thousand dollars. Both these animals had won the highest possible distinction on the Island of Jersey, and in England, and have since made remarkable records in the United States. Needless to say, every Jersey breeder was anxious to get some of the blood of Noble of Oaklands. B. H. Bull & Sons, of Brampton, Ont., have had several daughters of this bull, and two or three sons, which have won many prizes in the show-rings, but the Record of Performance yearly test quoted below speaks more for the bull than all his show ring achievements, Brampton Oakland's Lady No 1158 C. J. C. C., who commenced her yearly test when just three years old, and produced 7973 pounds of milk and 417 pounds of butter fat, which is equivalent to almost 490 pounds of butter. During part of the time she was under test, she was travelling the show circuit, winning prizes at Toronto, Ottawa, etc.

This is the right time of the month and the right month in the year to start doing a little better on the farm. There is always a chance to improve.

Put The Latest Style Telephones On Your Lines



INCREASE the efficiency of your telephone system by installing the latest style telephones. Canadian Independent Telephones are the highest grade made. We guarantee them to be superior in style, workmanship, and material to any others on the market. You can prove this true by trying them out on your own lines, side by side with other phones. This you can do without risking a cent. Just ask us about our Free Trial Offer.

Get Our Advice If your locality does not enjoy the social and business advantages afforded by an up-to-date telephone service it is time you got into communication with us. We are the largest Independent Telephone Manufacturers in Canada, and have been instrumental in seeing that the majority of the independent local and municipal companies have started into telephone business along lines that ensure success. We can help you get a telephone line for your locality. Write us and we will tell you how.

Ask for our No. 3 Bulletin—containing the latest information about building telephone lines.—Also No. 4 describing our magneto telephones, is free on request.

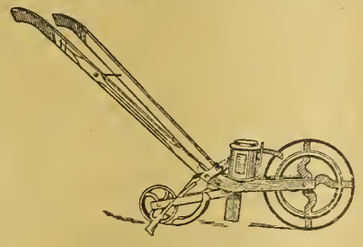
Garden Seeders and Wood Cutters

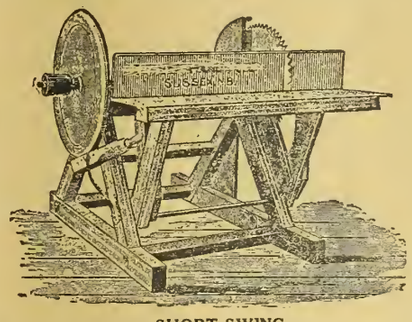


"THE BEST BY TEST"
GARDEN SEEDER

Does the work of two men in half the time. Makes the drill, sows, covers and rolls the seed while you walk.

No better seeder can be built for the fast and accurate sowing of turnips, cabbage, carrots, beets, corn and all other garden seeds.

Price $7.50 Delivered at Your Station.
ORDER NOW



SHORT SWING

"The best made" is the users verdict.

Made in four different sizes: Long Swing, Long Swing Improved (with extra long table androller) the Flat Roller Table and Short Swing.

The frame is built of seasoned birch, well mortised and bolted, the table is made of heavy gauge steel plating, the balance wheel is a solid webb and weighs about 180 lbs. The pulley is keyed and set screwed to the arbor unless otherwise ordered. The arbor is of the best steel 1 5/8" diam.

Both bearings supplied with compression grease cups and for convenience in handling we are putting skids under our machines this season.

Send for our Wood Cutter catalogue.

Remember we manufacture the celebrated Little Giant Thresher, The Sussex Root Pulper, Farmer's Feed Boilers, Grain Grinders, Hay Presses and Plow Castings.

The SUSSEX MANUFACTURING Company Limited, SUSSEX, N. B.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

FOR SALE—Cheap. Good pure bred Berkshire Boar. C. GRAY, GLENHOLME, N. S.

FOR SALE—Shorthorn Bulls. WALTER EATON, Upper Canard, Kings Co., N. S.

WOULD YOU MARRY IF SUITED? Best Matrimonial Paper Published. Mailed Free. THE CORRESPONDENT, Toledo, Ohio.

FOR SALE—Ayrshire bulls from two weeks to one year ten months. One Holstein two past. JOHN. A. HUGHES, Petitcodiac, N. B.

WANTED—Good, plain Cook. Write giving references or apply personally to MRS. T. H. ESTABROOKS, 102 Mount Pleasant Ave. St. John, N. B.

100 FINE WHITE ENVELOPES neatly printed with your return card, sent postpaid, 35 cents. Samples free.—HOWIE PRINTING COMPANY, Beebe, Que.

FOR SALE—Choice, large, fresh smoked Herring (kippered.) In boxes from five to twenty dozen at twenty-five cents per dozen.—MATTHEW MURPHY, Argentia, Newfoundland.

WANTED.—Experienced dairyman wants position as foreman on good dairy farm. Good references. Address C. A. LANTZ, Lower River Herbert, Cumb. Co., N. S.

FOR SALE—Five yearling Guernsey Bulls. Three sired by Imp Canada's Jethro Bass. Best milking stock. T. D. BLAIKIE, Great Village, N. S.

FOR SALE—Imported Clydesdale Stallion, rising four years old; exceptionally well bred, for further particulars, apply COSSAR FARM, Lower Gagetown, N. S.

DRESSED PORK 100 to 250 lbs. each well fatted. Butter prints and tubs. Eggs 3 to 10 case lots, prompt returns. JOHN HOPKINS, Mfgrs. of pork products, St. John, N. B.

MALE HELP WANTED—Earn $15 weekly at home evenings mailing Catalogues for Large Canadian Mail Order House. Representatives wanted in all cities, towns and country. NATIONAL SUPPLY CO., Windsor, Ont,

FOR SALE OR EXCHANGE—One pure bred Reg. Guernsey bull, 3 years old, quiet and a sure stock getter. H. R. ROSS West Branch, R. J. Pictou Co., N. S.

FOR SALE—Pekin Ducks, one and two years old. Also a few cockerels in buff and white Legborns. MARITIME POULTRY & SUPPLY CO., Moncton, N. B.

WANTED—A position as manager of a farm in the Maritime provinces, by an experienced married man Best of references. Apply to FARM MANAGER, The Maritime Farmer, Sussex, N. B.

LADIES WANTED—To do plain and light sewing at home, whole or spare time; good pay; work sent any distance; charges paid. Send stamp for full particulars. NATIONAL MANUFACTURING COMPANY, Montreal.

FOR SALE—Two Registered Jersey heifers, years old safe in calf to best bull in New Brunswick, also 3 months old Bull Calf grand breeding. Send for photos. B. V. MILLIDGE, Willow Bank Jersey Farm, St. John, N. B.

FOR SALE—Columbian Wyandotte Cock, a few hens and pullets. White Wyandotte pullets. Single Comb Brown Leghorn Cockerels, hens and pullets including first pen at Amherst. Black Cochin Bantam Cock. WOLFVILLE POULTRY YARDS, Wolfville, N. S.

AGENTS—MALE OR FEMALE—In every City, Town or Village in the Maritime Provinces to sell best line of Flavors, Perfumes, Powders, etc. Workers earn from $3.00 to $6.00 a day. No others need apply. Write C. C. RAND, 241 Oxford Avenue, Montreal.

WE WILL PAY YOU $120 to distribute religious literature in your community. Sixty days work. Experience not required. Man or woman. Opportunity for promotion. Spare time may be used.—International Bible Press, 182 Spadina Ave., Toronto.

WANTED—A smart young Canadian for general farm work. Must be a good milker, teamster and axeman, one handy with tools preferred. A good home on an up-to-date farm, employment by the year if desired. Give particulars, references and wages desired. CHAS. PETERS, Elmhurst, Kings Co., N. B.

BREEDING COCKERELS—Bred from the Parks Strain of Barred Plymouth Rocks which has been trapnested for egg production since 1889, and bred from bens whose dams layed better than 200 eggs a year. Price $2.00 and $3.00 each. Eggs for hatching $2.00 per setting. JAMES H. PRICHARD, Summerside, P. E. I.

Concentrates or Meals in the Dairy Cow's Ration

By J. H. Grisdale, B. Agr., Director Dominion Experimental Farm.

Knowledge of the composition of food is of very little use excepting there be added to that knowledge, information as to palatability, as to suitability for certain purposes, as to influence on the digestive organs or as to its effect upon the article being produced for sale, whether flesh, milk, cream, cheese or butter.

The notes which follow make no claim to being exhaustive but are, for the most part, as comprehensive as will ever be found necessary to enable the average dairy farmer to feed his cattle to the best advantage both as to cost of feed and quality and quantity of product.

BARLEY.

Barley when well ground and mixed with other and lighter meals has proven to be a valuable feed for milk production. It is held to have a good effect upon the flavour of dairy products, although the writer has never been able to satisfy himself that such was the case. It is usually a profitable food for cows but must always be fed cautiously and should never constitute more than half the meal ration. The other meals most suitable to feed along with it are bran, oats, oil cake and corn.

BREWERS' GRAINS.

The malt grains freed from the dextrin and sugar are known as brewers' grains. They are often sold to the local trade in the wet form, and are then valuable only for immediate use, as they do not keep. They are not iojurious to cows, as claimed by some, but make a very good food when mixed with corn, oats or barley.

BREWERS' GRAINS (DRIED)

A very valuable and easily stored cattle feed can be got by removing some of the excessive moisture from wet brewers' grains, when a feed containing a fair quantity of protein, carbohydrates, and fat is obtained. Four or five pounds per cow per day along with corn, oats, or barley and small quantities of oil cake meal or gluten meal will give good results in milk production.

BUCKWHEAT.

Buckwheat for dairy cows is rarely used in Canada outside the Maritime Provinces. It has a fair feeding value. When ground and mixed with other concentrates is usually cheapens the ration and frequently seems to increase the flow of milk. It is sometimes supposed to injuriously affect the flavour of milk.

BUCKWHEAT BRAN.

This is the same usually given to the mixture composed of the buckwheat hulls and that portion of the grain immediately within the hulls. The latter is a very good feed, rich in protein, but the hulls have practically no feeding value.

CORN.

Corn is an excellent feed for dairy cattle. It is a concentrated source of nutriment, extremely palatable, easily masticated and rapidly assimilated, but should never make up more than one-half to three-fifths of the concentrate part of the ration. Poor in protein but rich in digestible carbohydrates, it should always be ground and fed along with some other grain rich in protein and light in character, such as bran, shorts or crushed oats. Corn and cob meal is better for dairy feeding than corn meal alone or as the chief part of the meal ration. Pure corn meal is rather heavy but if mixed with cut feed can be fed in considerable quantities. Its great value lies in its easy and almost complete digestibility.

CORN OIL CAKE.

Corn oil cake consists of the pressed germs freed from most of the oil they carry. It is rich in ether extract, or fat, and protein. It should never be fed in large quantities and always mixed with feeds such as bran or oats, or a mixture of other light meals.

CORN BRAN.

Corn bran has about the same feeding value as good straw. It contains about one half less protein than wheat bran but more carbohydrates and fat. It feeds well with glutea meal. Only when low priced can it be fed with profit.

COTTON SEED MEAL.

Cotton Seed meal, as sold on the Canadian market, is of very variable composition. It frequently contains considerable hull and much fluffy, fibrous material. Such meal is of low feeding value and need not be expected ta give good results.

Cotton Seed meal of good quality, that is, free from hulls and fibre, is, however, an excellent feed for dairy caws, wnen fed in conjunction with other and lighter meals such as oats and bran. It is, as a rule, not very acceptable to cattle at first, but is soon eaten with apparent liking. It is usually as well to feed from two to three or at most four pounds only of this meal a day, along with other coocentrates. Larger quantities may injuriously affect the health of the animals.

Cotton Seed meal is one of the few feeds likely to in any way affect the character of the fat in the milk produced. As observed elsewhere, oil cake meal fed freely will usually induce the production of softer fats or softer butter. Cotton Seed meal, however, has the opposite effect, as it will, if fed freely, cause the cow to produce harder fats or firmer butter.

DISTILLERS' GRAINS.

From experiments it would appear that dried distillers' grains are better milk producers than oats. They are worth about 50 per cent. more than bran, depending, of course, upon their quality. According to German experiments, they will produce about 12 per cent. more milk and 9 per cent. more fat than oats. Our experiments here indicate an even higher relative feeding value than the German experiments point to.

EMMER.

Emmer and speltz, as to their nutritive properties, are more nearly allied to barley than to oats, but in practice they have about the same feeding value pound for pound as oats. They are always ground together with the hulls, and may enter in large quantities—one-half or more—in mixture with other grains.

Where the rain fall is so low as to make it difficult to grow oats and barley, emmer and speltz frequently do very well.

FEED FLOUR.

When feed flour can be had at reasonable prices, it is a good feed for milk production as it contains a high percentage of carbohydrates and fat. Objection is sometimes made to its stickiness. To overcome this, it should never be fed alone and always in small quantities and thoroughly mixed with bran or with some other feeds rich in protein and light or loose in character.

FLAXSEED.

On account of the high commercial value of the oil, flaxseed is not extensively used as cow feed. It cantains a considerable quantity of protein with an excess of oil, but very little starch. Steeped till it forms a gelatinous mass, it is of great value as a feed for calves on skim milk. It may be used as above either whole or ground. Mixed in small proportions along with coarse grains and ground, it adds greatly to the palatability and wholesomeness of the meal ration. It should very seldom constitute more than about one fifth of the grain mixture and one-tenth is usually an effective proportion.

GLUTEN FEED.

Gluten feed, as contrasted with gluten meal, contains more coarse residues from the manufacture of starch from corn. The affect of the addition of more or less hull or skin of the kernel is to render the by-product more open io character, lignt er in weight and less rich in protein, hence of lower feeding value. Gluten feed is worth about the same as wheat bran from the milk production standpoint, but it is not nearly such a safe feed to use. Gluten feed, like gluten meal, varies greatly in composition and should be bought subject to analysis.

GLUTEN FEED.

A by-product of the manufacture of corn in starch and glucose factories, gluten meal is rich in protein and has a feeding value about equal to oil cake. It should be fed mixed with either bran or oats. It is susceptible of adulteration and should be bought only on guaranteed analysis. Some gluten meal will show over 30 per cent. protein and may go as high as 35 per cent. When showing over 30 per cent. protein it is worth from 30 to 40 per cent more than wheat bran.

HORSE BEANS.

Horse beans are not much grown in Canada. They are rich in protein and enter very well into mixtures with bran, oats or corn, but no more than two or three pounds per cow per day shauld be fed.

MALT SPROUTS.

In the process of malting, the seeds are allowed to germinate; the germination is arrested at a certain stage and the seeds dried. The sprouts are broken off and separated from the grain and dried, in which form they are sold for feeding purposes. Malt sprouts are relatively rich in protein, 50 per cent more so than bran, but law in carbohydrates and fat. This feed is not much relished by cattle. and can only be fed in limited amount. It should be soaked for several hours before feeding and mixed with ground corn, barley or bran and never more than 2 to 5 pounds per day be fed. It is well to secure a sample for trial before buying.

OATS.

Oats of various varieties are :ed very extensively by dairy farmers. They have proven themselves to be fairly satisfactory as a milk-producing feed. It is, however, as a flavoring or palatability increasing constituent of the meal ration that they are most worthy of consideration. When finely ground, as should always be the case, a small proportion in the meal mixture adds very materianlly to its effectiveness. No other single grain or meal ration will give as good results as oats. They are,

(Continued on page 369)

N. B. Farmers and Dairymen in Annual Session

The thirty-eighth annual meeting of the New Brunswick Farmers' and Dairyman's Association was held in the city of Fredericton on March 2nd to 6th inclusive. The evening meetings were held in the Council Chamber; the morning and afternoon meetings in the exhibition buildings.

THE OPENING SESSION

was held on Monday evening. President W. H. Moore, occupied the chair The attendance was fairly representative of the various parts of the province. We remember previous years, when a recess was declared to give delegates a chance to register, present their credentials and pay their membership, the delegates came forward very slowly and often canvassers would have to be appointed to interview the delegates at their seats this year the delegates came forward with a will, as if striving who should be the first to be registered. This shows the increased interest that is being taken in agricultural organization.

THE PRESIDENT'S ADDRESS

"As chairman of this convention it becomes my duty to give an address relating to circumstances in connection with our farm work.

"I do not purpose explaining everything, or solving all problems, but aim at giving some problems that will lead you to do some thinking, and to start discussions along various lines. So I ask you to keep pencils busy jot down some ideas, and let us have record breaking results from these meetings.

"I assure you, that in one way, your chairman is like the good Apostle Paul, for you may recall that he told the Corinthians that: "I come not bciore you with eloquence of speech." In another place he says: "I press toward the mark." No doubt we all press toward the mark, of better farming—and some are more capable of reaching this mark than others.

"I feel that we as farmers owe the Hon. Dr. Landry, our past Commissioner of Agriculture, a debt of gratitude for the able manner in which he has supervised the business of his department for the well-being of New Brunswick farmers, and personally I wish to thank his office staff for all assistance they have given me in many ways.

"Is has been my privilege during the past year to visit a number of different sections in New Brunswick, and meet many of the farmers at home and at agricultural fairs and at the Fredericton exhibition. Their methods of working have been observed, their conditions for work and especially their work in connection with the growing of crops, and I think that owing to the variations of soil that all the farmers of this province cannot be expected to grow surplus crops of one kind in all different sections.

"As an example, we would not expect the farmers living along the dyke lands to grow a breat surplus of potatoes, as is done in Carleton and Victoria Counties, and to some extent, in part of York County. Nor could we expect the farmers in these more northern counties to compete with those of the dyke lands in the cheap production of hay and cattle.

"Not long ago, a farmer remarked to me, that he thought there was far too much fuss being made about the potato market. That man has not visited the sections where the farmers specialize in potato growing and was therefore rather narrow minded in connection therewith. Again the complaint comes that the farmers of Carleton and Victoria Counties are ruining their farms by growing potatoes on commercial fertilizers alone. To who ever it may concern, this advice is given, visit the special potato sections and observe before arriving at any such conclusions.

"During the past year there has been extremes in all kinds of weather but as amalgamation seems to be the order of the day, why should we not expect amalgamations of warm days, of cold days, of wet days, or even of stormy days. We might recall the thirteenth and fourteenth of January for amalgamations of wind and snow.

"Crops have been satisfactory throughout the province the past year. Considerable damage was done to crops by untimely changes in the weather. Perhaps the crops were a bit untimely as well. Considerable quantities of potatoes were damaged by the heavy frosts the last few days of October and first of November. Potatoes should have been all housed at that time of year. Yet it is quite evident that many potatoes were damaged by early digging, by housing them before they were sufficiently matured.

"The number o. farmers who try to grow the best quality of crops possible for their localities is small compared to the number who should do so. The average yield of grain is much lower in our province than it is in the sections where people give more attention to seed selection. There is grand apportunity of pressing towarh the mark of more and better crops. During the past year market prices have been good for all farm products. Of course, we farmers would like still higher prices, but when we consider our fellow beings, who buy the goods, together with the freight and middlemen's profits added we must agree that they are having as much of a struggle as we. One thing in connection with our produce and prices. Is it not costing us too much to market our surplus? The time, wear and tear of outfit added to cost of production, really does not leave a very great margin upon which ta become wealthy. ...

"The road problem is one of great importance. Had we good roads at all seasons, the cost of marketing would be cut down, for there is quite a difference in being able to haul half a ton, and two tons. But so long as we have rains and frosts, we must expect bad roads. Those having a short haul do not realize the importance of good roads, as do those who must drive from twenty to thirty miles to market.

"The new railways that are opening up should help the farmers in the sections through which the railways are built.

"The opportunities open now for obtaining education along agricultural lines is certainly the best now that has ever been in New Brunswick.

"With the arrangements made by the governments for the transportation to the various Agricultural Colleges, and free tuition at Truro, the various Short Courses and Agricultural Schools under the supervision of experts, the Dairy Schools and the seed fairs and special farm trains all are excellent aids in pressing toward the mark. The experimental farm being established here will work out problems for us that should do us all good. It will do us good to visit there and see the stock, crops, and methods of handling them after the farm is in proper working order. We have come to the time when we need demnostrations to go along with talk

"Another form of education is opened by the field crops competitions, and when the farmers get a bit more education in this line and exert a bit more energy there is going to be some very close competitions and he will need be a very pleased farmer, who can carry off first money. These competitions were carried on in seven counties of our province in 1913. I would have liked very much if other counties had taken up the work also, through our county vice-presidents. I would have had reason to think that my season as president of this association had left some good work begun In examining fields entered in these competitions, only two fields out of over 30 that I examined should have been discarded. One was a plot of turnips affected with club root, another was a field of some acres, of potatoes affected with scab. There were many fields of most excellent quality and yield of grain. Good enough, so that if more fields had of been sown with pure seed, there could have been a goodly quantity of pure seed grain for sale. But many farmers are learning. Would it not be a good idea to boom the sale of New Brunswick grain and potatoes, for seed? In connection with this work I would like to say that by all odds the best managed, most neatly worked farm that I visited was that of Mr. Charles McCormick, of Somerville, Carleton Co. What think you? Do not our farmers owe the mechanics a debt of gratitude for having produced farm machinery of such efficiency as is at present manufactured. I do not brag upon materials used by some manufacturers. When we realize the work that can be accomplished with machinery that formerly was done by hand, we are led to believe that we are living in a good age.

"One man can now with proper machinery produce as much crop as three men could produce by hand 25 years ago, and had we now to turn out work by hand, as was done a quarter century ago, times would be just as hard as at that time.

"I think the past year has seen as many people moving from the country to the towns and cities as has been in the past. Why not let them go to the towns? It makes that many more non-food producing bodies to be fed, and just between us now, were the people who have moved to the towns, of any particular benefit to the country? Was a country district any the better of these people living in it? Yes! Some have moved to the towns who were very well to do. Did they benefit their districts in any way except to pay their taxes? Did they improve the stock of the district? Did they do anything towards providing or growing better seeds or better bred animals, maintaining better schools? If so the country district met with a loss.

"A well-known American writer has said apropos of the rapid increase in urban population, as compared with rural dwellers, that "life in the city destroys the nerve of a man to take his chances with just nature. He would rather risk pauperism to get a 'job' than to endure with fortitude the chances of the seasons in the country. He has lost his plowhandle muscles, and his capacity to hope for a harvest just from the earth. He wants wages 'by the day' or month. He lacks the courage to believe in the soil, to endure the hardships of cold in the winter, and of heat in summer." For these and other reasons he does not care to return to the farm.

"Again we hear of the scarcity of labor. Is the country any the poorer because there are none of the semi-idle class hanging about, who could be secured to do occasional work?

"No! Nearly every man in the country now is a grower of farm products, and I believe the country and the people are as well off as if there were a great number of idle persons hanging around.

"It seems to me that if country clergymen would get interested in the work of the farmers they could do a good work. If the clergy sympathize with the farmers the farmers will have much more sympathy with the work of the clergy.

"We sure regret the removal of the Rev. Mr. Hunter-Boyd from our meetings, and how much more must the farmers of his old parish regret his removal from them. What a great source of energy was the Rev. Father Burke, of P. E. Island, whose influence was felt throughout the whole of the Matitime Provinces. The farmers of Antigonish, Nova Scotia, are at present blessed with a clerical gentleman, who is much in sympathy with the farmers and their labors and as one farmer cannot lead another, but are easily led by one of another calling, who is in sympathy with them and their work, it is inestimable the benefits derived from this source.

"In connection with this preamble iet us have some predictions. ...

"I think the time will come when we will see the stonepiles in our fields crushed up and put upon the roads, while the roads are muddy and loosened up by frost in the springtime. Then we would have a roadway that would stand wear. The fields would also present a better appearance.

"2. Sections will specialize in growing and marketing facm produce. A certain section will be noted for the quality of its goods that it has for market.

3. That potatoes will eventually be graded after the manner of grading fruitj That now the poor stock sells rather than the good selling on its own merits.

4. That it is possible that smaller areas may be worked and worked so that in sections skilled agriculturalists may manage several farms and more scientifically or intensively. Althus have a higher quality of work performed than is done at present.

Such neat workmen as Mr. McCormick, before mentioned, are capable of a great good in a community if people would only appreciate these good qualities and copy this method.

"In conclusion.—The programme of our doings for the next few days has been made up to cover a goodly number of topics, interesting to New Brunswick farmers, and it is our desire to have the delegates freely discuss the various subjects and discuss them from a purely agricultural point of view."

ADDRESS OF WELCOME AND REPLY.

Following the President's address, His Worship, Mayor Hooper, Fredericton, who takes a deep interest in the agriculturists of this province, extended the welcome of his city to the delegates, to which address H. H. Smith, treasurer of the Association, replied in a few well chosen words. Mr. Smith is one of the progressive farmers of Sunbury County and in the course of his remarks instanced the value of several of the garden vegetables, and small fruits that may be produced from a well worked acre of good soil. Following are some of his figures:—Cabbage, $250.00 per ac.; Potatoes, $100.00 per acre; Strawberries, $400.00 to 500.00 per acre; Raspberries, a trifle more than Strawber-

ries; Onions, at 5 cents per pound, $1000.00; Cucumbers and Cauliflowers, $1000.00 per acre. To get these results a farmer must know his business and apply his knowledge in a systematic manner. The province of New Brunswick was now on the eve of great development along the lines of agricultural education, this coupled with the fact that the province is the peer of any one of the Dominion Provinces in agricultural resources was something that our young men should ponder well before casting their lot in any other country.

HON. J. A. MURRAY,

the newly appointed Minister of Agriculture for the province, made his virgin speech as minister before the association. Mr. Murray said he had been greatly impressed with the spirit of optimism that had been evidenced in the preceeding speakers' remarks. He thought it presaged a great future as confidence in one's work was ane of the greatest assets a farmer could have.

Mr. Murray endorsed the tribute that had been paid to Hon. Dr. Landry, his predecessor in office, and solicited the co-operation of the farmers of the Province in all that stood for the improvement of conditions under which the agriculturists has to labor.

While 1913 had been a year of financial depression in Canada its effect had been little felt in New Brunswick The province was on a sound basis agriculturally, commercially and financially, so that even the people of the much boomed West are turning envious eyes towards us. It therefore was an opportune time for Easterners to do all they could in the way of booming our resources. The future of the Province will be whatever its people make it. The farmers of the province, in too many cases were not alive to the possibilities of their province, and this was vouched for by the large quantities of farm products that had to be imported to supply the demand.

He spoke of the educational advantages in New Brunswick and urged farmers to attend the Woodstock Agricultural School, a school built by the estate of the late L. P. Fisher, and equipped and conducted by the New Brunswick Department of Agriculture. On the success of the Woodstock school would depend the establishment of agricultural schools in other parts of the province. If the Woodstock School is well patronized, other schools will be established as fast as the requirements warrant. A Summer School of Science will be established next summer in Woodstock and teachers from all parts of the province will be there instructed in elementary agriculture and these in time will instruct the children along these lines in various parts of the province.

The farmers' special train last year on the C. P. R., had proved successful, and during the coming summer, a similar train will be run over the I. C. R.

The Dairy School in Sussex had been remodelled and ample provision made for the instruction of men and woman in Dairying and Household Science.

Horticulturally, the province was making gains in leaps and bounds. From 12,000 to 15,000 apple trees had been planted in the province last year and when these and trees subsequently planted will come into bearing, it will mean a great deal for the province.

Mr. Murray said his object in calling a meeting of the live stock men for Wednesday afternoon, was to get advice and support from the men interested in the industry so that he could work hand in hand with them. The year 1913 had been the banner year of the dairy industry in New Brunswick. Some parts of the province was very little known for dairying and in this line much work remained to be done.

Speaking of the potato embargo, Mr. Murray said the powdery scab was as prevalent in the State of Maine as in New Brunewick. Aroostock County potatoes were now barred from other parts of the United States. He was now trying to arrange with the federal government to exclude these potatoes from New Brunswick. Every effort would be made to eradicate the scab and brown tail moth from the province and to do this vigilance and constant effort would be required.

Along poultry lines the department was doing good work in demonstrating proper fattening, killing and marketing methods.

The work of the women's institutes was another good educational feature These had secured a firm hold in this province and their work had enlarged. Through these women were taught better methods of housekeeping and other work that falls to the lot of women.

While Agricultural Societies had increased in numbers in the province, the grants had not been diminished.

The Ditching Machine purchased by the Department for demonstration drainage purposes had done good work last season and the campaign will be continued in 1914.

In closing, Mr. Murray said that the government could only go so far and where they stopped the farmers of the Province must continue the work. The farmers of the province would always find the latch string of the Department of Agriculture on the outside and he invited them to make use of the Department and its various officers wherever they felt they needed advice and practical assistance with their various problems.

APPOINTMENT OF COMMITTEES.

Following Mr. Murray's address, Messrs. J. Frank Roach and C. Fred Fawcett were appointed as a Finance Committee, and Messrs. S. L. Peters, A. J. Bernier, M. McLaughlin and A. R. Wetmore as a Resolution Committee.

MR. J. B. DAGGETT

Secretary for Agriculture, gave an outline of what had been done re the powdery scab embargo. It is evident that the Aroostock County farmers had been the instigators in causing the embargo to be placed on New Brunswick potatoes. They too, have been weighed in the balance and been found wanting and now they too are barred from shipping to other parts of the United States and every effort will be made to prevent them from using Canada as a dumping ground for their infected potatoes.

On Tuesday afternoon, Andrew Elliott gave an interesting address on beef cattle and their characteristics. He dealt at length with the decrease of beef production in Canada and expressed the belief that in New Brunswick there was a profitable outlook for beef raising. The market for beef was at hand and the production in this province was far below the demand. Mr. Elliott suggested that a good way to keep the boys on the farm was to encourgae them to raise beef cattle and give them the proceeds of the sales made.

W. Searle, Fredericton, gave tbe gathering some useful pointers in regard to the kind of meats that had ready market. He spoke from the standpoint of a buyer and stated that most of the meat consumed in the provinces was imported. Local beef was of an inferior quality on the whole.

Mr. Elliott followed in a practical test of judging by score card, and was assisted by a number of those present.

At the evening session reports were read from various agricultural societies. Kent, Queens, Madawaska, Charlotte and Sunbury vice-presidents had statements showing progress in their respective counties.

An interesting discussion on alfalfa, led by Andrew Elliott, was brought on during the evening. The principal speaker gave his auditors many useful pointers in regard to alfalfa. Mr. Elliott stated that the finest piece of alfalfa he had ever seen was growo in the parish of Havelock, Kings Co. Later special attention was called to the peculiar adaptability of this parish for rais-ng the plant. Mr. Daggat announced that his department was prepared to conduct experiments with alfalfa for a number of years in order to test out its possibilities in New Brunswick. He offered to supply seed free for a number of small plots.

T. O. Clarke, who succeeds J. A. Telfer as sheep superintendent in the province, addressed the meeting, and invited the members of the F. & D. A., to use him in establishing sheep flocks. He gave statistics to show that there was no more profitable animal grown on the farm and none that needed less attention.

On Wednesday afternoon, Hon. J. A. Murray was in attendance to discuss with the members the subject of stock improvement in the province. A stenographer was present and took full notes of the suggestions made. These will be later used as a guide in fixing a policy for New Brunswick. A number of very excellent suggestions were made by delegates. Omong those who offered opinions were C. Fred Fawcett, George Jardine, John Campbell, Samuel Coates, Jas. Mavor, Mr. Reid, Stewart Fiske, Morris Scovil, J. Frank Roach, John Woods, Mr. Harding, M. A. McLeod, J. B. Daggett, S. L. Peters, O. D. Wetmore, R. G. Murray, T. J. Fraser and F. Donavan.

Hon. Mr. Murray promised to take up the question seriously and place in the field as many men as are needed. He recognized the need of encouraging breeding cattle and promised to devote more attention to it. He asked for the assistance of all, and informed the meeting that experts would be brought from other provinces to give the breeders the benefit of their experience.

H. B. Durost dealt with bee culture, W. W. Baird read an instructive paper on soil cultivation, followed by a practical talk on cultivation of the soil by Andrew Elliott.

The evening session was devoted to the discussion of an excellent paper on fertilizers by A. R. Wetmore. C. Fred Fawcett offered some practical suggestions along the same line.

The following resolutions were passed:

"This association, believing that the work done by the better farming special and its staff of instructors, has been a great advantage to the sections of the province visited, would recommend a continuation of the service and trust that the Department of Agriculture may see its way clear to do so."

"Whereas the Department of Agriculture having established agricultural schools throughout tbe province for the purpose of educating the youth of the country in the best methods of agriculture; and

Whereas, they have made tbose educational institutions accessible without any charge of tuition; therefore

Resolved, that this association does most heartily congratulate the Department of Agriculture on its effort in this line of action."

"Wheras an embargo has been placed on potatoes grown in this province by the authorities at Washington prohibiting their entry and sale in the markets of the United States because of a disease known as Powdery Scab; and

bers of this association."

"Whereas, New Brunswick farmers enjoy the satisfaction of knowing that N. B. grown potatoes are easily superior in quality to those grown by our western neighbors; and

"Whereas, our department has promptly taken the necessary steps to ascertain the possible existence, if any, of the Powdery Scab in N. B.; therefore

"Resolved, that this association do give expression of its hearty approval and appreciation of the activities and co-operation of the Department of Agriculture in so far as possible preventing any loss to our farmers in making sale of their potatoes."

"Whereas, by the recent reconstruction of the Provincial Government, led by Premier Fleming, Hon. Dr. Landry, our late Minister of Agriculture, has accepted the position of Provincial Secretary-Treasurer, and therefore has severed his connection with the active work of administering the Agricultural Department;

"Therefore resolved, that this association, in recognition of his services as Minister of Agriculture from 1908 to 1914, during which time many reforms were affected and an active and progressive policy was undertaken and successfully carried out, desire to place on record their thanks and appreciation of his services in the interests of our provincial agriculture.

"And further, that a copy of this resolution be conveyed to Hon. Dr. Landry by a committee of three mem-

Thursday's program opened with a trip to the Experimental Farm, where the visitors were received by W. W. Hubbard and shown over the premises.

In the afternoon addresses were delivered at the exhibition buildings by N. W. Eveleigh and Donald Innis on field crops, competitions and methods of judging. Counties which have not engaged in competitive work were urged ta do so. Mr. Innis gave some well founded advice as to seed selection and urged that only pure seed be sown. W. H. Moore was also heard in regard to field competitions.

W. W. Hubbard read a paper on silo construction and ensilage. He also drew attentian to the demand from Ontario for New Brunswick seed potatoes.

An important question, the building and maintenance of roads, was dealt with John Woods, Welsford.

At the evening session several resolutions were passed. Amendments to the game law permitting farmers to protect their crops from deer and moose were suggested.

The government will be asked to take steps to supply fertilizers to farmers as near cost as possible. The department will be requested to provide sheep to certain farmers for demonstration purposes.

F. C. Nunnick, of Ottawa, gave an illustrated lecture on conversation ideas and showed by pictures what should and should not be done on farms. He made a strong plea for boys on farms.

It was announced that the agricultural school at Woodstock would open on Monday and a short course extending over three weeks would be given fcee of charge.

The officers of the coming year were selected as follows: President, Thomas Strong; vice-president, J. Frank Roach; recording secretary, A. R. Wetmore; corresponding secretary, Morris Scovil; treasurer, H. H. Smith; county vice-presidents· Carleton, Bert Holyoke; Charlotte, Stanley Wilson; Kent, Ameda Maillet; Kings, O. W. Wetmore; Albert, R. A. Smith; Gloucester, John McIntosh; Madgwaska, J. A. Bernier; Queens, Murray Starkey; Restigouche, Henry McIntyre; Northumberland, John McColm; St. John, R. S. Murray; Sun-

COMMUNITY SERVICE.

Under the above caption the following article appeared in a recent number of the Maine Farmer. We pass it on for the benefit of our readers. It is pithy and to the point.

"What I wanted most I do not find."

Many years ago there was a storekeeper in the city of Lowell, Mass., who was raised back on a farm. He had been prosperous in his business, and had a family of six children, in whom he was very much interested. He desired to have a home back in the country.

One day a farmer called at his store with a load of produce for sale, which he bought. The trader inquired where he was from. "Do you know of a good farm for sale in you section?"

"I do not know of many, but there is one in our vicinity where an old couple live, their children have gone away and want them to come and live with them. It has been a nice farm but is now somewhat run out. I think this place can be bought."

"I think I will drive out there some day."

The farmer returned home and told of his talk with the trader. It set the whole place to watching for a city team. One nice day a fine looking team drove into the door-yard of the old farm, stopped a while, made a tour through the neighborhood and then returned. In the evening there was a general turnout to the old farm to learn the result of the visit. The main question was, "Did you sell the farm? If not, why not?"

The old man answered in a sad tone of voice: "They liked the place very much, but there was one thing lacking. He said, 'What I wanted most I do not find. We have six children which we wish to bring up outside of city influences. As we rode through your neighborhood, we passed your schoolhouse, a very shabby building. It shows that you do not take any interest in the schooling of the children. And your old church building shows by the grass growing around the steps and the clapboards hanging by one nail that you have no interest in morals or religion. I see all of your other buildings are in good repair and are painted; even the blacksmith shop is painted white; therefore I cannot buy your place now.'"

Then up spoke the wealthiest man in the place, the owner of a large farm with fine, large buildings, and cottages for his help to live in (he thought it cheaper than hiring single folks). He said this must be stopped! "We are wholly to blame for all of this. That old church stands as a monument to our parents. It must be repaired. I will lead off by giving $50. We should have a new schoolhouse. Let us make a petition to the selectmen to call a school meeting to raise money to build a new schoolhouse." All this done before they went home.

In six months' time the city family was living at the old farm. There were meetings at the old church, and a revival in religion was started, and each one who became interested dated back to the words, "What I wanted most I do not find."

FATHER AND SON ON THE FARM.

One of our bright young men living in the city dropped into our office recently for a chat on farming matters. The young man was filled with enthusiasm in general, and had a genuine case of the "back to the land" fever. He was looking for a farm location. We quote from his conversation a few thoughts which are probably in the minds of many city young men placed in a similar position.

"My father was a good man and a good farmer, and particularly good and kind to his children," the young man stated. "When we were children we worked on the farm, but our lives were made easy by the hard labor of father and mother. We were sent to school whenever possible. The one thing for which my parents were to blame in raising their children was that they forced us into grooves of life for which we were not prepared. Henry was raised with the one idea of being a lawyer, and a poor lawyer he proved to be. My own life was shaped for the ministry, and in spite of my disinclination, my desire not to offend my mother's lifelong wishes led me to accept the charge. Time proved that neither my brother nor I were fitted for the life-work for which we were prepared by our parents. The regret of my life is that my father did not take me into comradeship in the conduct of the farm, that he did not teach me the things he was a lifetime learning, that he did not impress on my mind the advantages of farming, the only life for me worth living, for now I am bound to be a farmer just as my brother has become."

As this young man told us of this personal history, we could not help but think of the many parents the country over who are making this same mistake with their children. And we wish these parents would read the lesson in the true history above quoted. There are many boys who leave the farm simply because their parents do not teach them the advantages of a good farm, and that a good farmer is as much to be respected and honored by his fellow men as a good lawyer or a good preacher.

We recently visited the farm of a prominent breeder of pure-bred cattle. He had sent his only son, who had previously wanted to leave home, to the agricultural college. When the boy came home he was full of enthusiasm and interested in the farm and herd. He told his father what he had learned in college about farming and about stock, and made some suggestions, later carried out, which the father told us really made him money and benefited the farm. "My boy has decided not to leave the farm, but he's going to stay by me and take my place when I die," and there was a suspicious dampness in the old man's eyes as he talked, that made us agree with him that the boy was turning out well, and that the future need not be worried about.

The boys and girls are the most important crop on the farm after all, and the farm is the best place to keep them. They will not all stay there, but they ought to know that the farm is not such a bad place after all, before they get ready to leave it. The more we think about it the more we believe that the future prosperity, morality and physical welfare of the people of this country depends on the farm boys and farm girls. From the farm comes the fresh blood and the strong blood, the clear eye and the well-balanced intellect, the clean mind and the moral strength. The city needs many of them, but the farms need to keep still more.

SHORT COURSES AT WOODSTOCK

As we go to press the first short courses, other than the dairy courses at Sussex, in the history of New Brunswick's Department of Agriculture, will be opened in the Fisher Vocational School, Woodstock. The school is in charge of Mr. Robert Newton, B. S. A., who has recently assumed charge of the school. We have had the pleasure of a perusal of the programme laid down for the three weeks' course.

It is so designed that the farmer or farmer's son who cannot see his way clear to attend the full number of sessions may arrange to attend for a week or so.

Associated with Mr. Newton, on the tution staff during the short course period are some of the ablest agricultural exponents in eastern Canada. Plan to attend the courses. It will do you good to rub shoulders with your fellow farmers.

What about your supply of garden seeds? Peruse our columns. See what our various seed house advertisers have to offer. Send for their catalogues. Many of these catalogues are veritable text books on gardening. Make your selections and order early.

The Prince Edward Island Provincial Seed Fair was held last week at Summerside. This week the P. E. I. Central Seed Fair is being held in Charlottetown. The seed fairs have done much for the improvement of the seed grain that is being used on and shipped from Prince Edward Island.

A day or two ago we had the pleasure of meeting our venerable friend, Capt. Jas. Reed, the most extensive seed grain shipper of the Island province. His clients from coast to coast report excellent results from the use of Island seed oats. Some remarkably high yields are reported in the various testimonials sent in by the farmers who have tried and proved them.

Concentrates or Meal in the Dairy Cow's Ration.

(Continued fram page 365)

however, usually so high in price as to prevent their being so used. In any case, they do better when mixed with some other grain or meal. The other meals most suitable to feed along with them are bran, oil cake, cotton seed, barley, peas and corn.

OAT HULLS.

Oat hulls are low in nutritive value but not unpalatable to the cow. When they contain any portions of the grain, broken kernels, or oat dust, as they practically always do, they have a considerable value as a flavouring feed and are worth probably half as much as crushed oats or even more. They give best results when dampened before feeding.

OIL CAKE MEAL.

Oil cake should always be on hand. It is a very palatable feed and has a beneficial effect on the digestive tract. It serves as an appetizer and laxative as well as a concentrated source of protein. Its general effect is to place the animal in fine condition, with a pliable skin, sleek coat and good quality of flesh. It should be fed in amount not over two to three pounds per 1,000 lb. cow per day along with some other meals such as bran, corn or oats or a mixture of the three. Milch cows fed freely on this meal are likely to produce soft fats in their milk, or that, if churned, will yield a soft butter.

PEAS.

Peas being very heavy and very rich in protein, are suitable for mixing with lighter meals. They are palatable and easily digestible. The high price at which they are usually extensive use. They are suitable for sold does much to prevent their more feeding along with oats, bran or corn. Fed in moderation and along with oats, calves do well in them.

PEA HULLS.

Pea hulls are practically worthless as feed for milch cows. They are dry in nature and almost destitute of the best nutritive material. When very low in price, they might be fed to cheapen the ration, as they are light and fairly palatable.

RYE.

Rye is not much used for cattle feed in Canada. It has been fed in Denmark and is reported to have a deleterious effect on the quality of butter. When used at all, it should always be fed in small quantities, ground and mixed with bran, oats or corn.

SHORTS OR MIDDLINGS.

This is a by-product of the manufacture of wheat flour and is a valuable feed if obtained without the addition of mill dust and other adulterations. About equal to bran in dry matter and protein content and rather higher in carbohydrates, it is somewhat 'heavy' as a feed, and should be mixed with corn or oats.

SOY BEANS.

Soy beans are grown in very small quantities in Canada and then usually as a forage crop. As a meal feed for dairy cows they are practically unknown here but, when available, are very valuable if mixed with other concentrates. They are rich in protein and oil. Cows must be accustomed to them to eat them readily. They should be fed along with bran, oats or corn, but in moderation, since they have a laxative effect and tend also to soften the butter.

WEED SEEDS.

Weed seeds, being the residue from mill screenings, contain a great deal of dust with all kinds of chaff as well as many evil-smelling and worse tasting seeds which are not always a safe feed for dairy cattle. Feeding at intervals, in small quantities, ground, and mixed with other feed, turns to profit an otherwise waste material. Some weed seeds are very rich in oil, in protein and in carbohydrates. It is, however, safer to feed them to sheep, swine or poultry, and always in the ground state.

WHEAT.

Wheat as a feed for dairy cows is almost unknown in Canada. Where tried it has proveo satisfactory. To give the best results, it must be rather finely ground, and fed along with other meals. The other meals most suitable to feed with it are wheat bran, oats, oil cake and corn. Frozen wheat, when available, is a first-class feed for dairy cows. It should be finely ground and should not make up more than half the meal mixture. Oats and wheat bran are suitable for mixing with frozen wheat.

WHEAT BRAN.

As a concentrate feed for dairy cattle, all things considered, wheat bran has no equal in Canada to-day. It is good combined with other meals such as oats, corn, barley, pea, gluten, oil cake or bean meal. It comes nearest to making a successful meal ration of any concentrate fed alone. Furnishing, as it does, protein and ash, which are essentials in milk production, and also some amount of starchy matter, it should enter into every meal mixture intended for dairy cows. Being exceedingly wholesome, easily digestible and very palatable, it may constitute any part or even the whole of a profitable dairy meal ration.

Wheat bran is about of equal feeding value with a mixture of barley and oats, and is very little inferior to oats alone, which are usually very much dearer pound for pound. It is mildly laxative.

Bran, as offered on the Canadian market, is frequently adulterated with crushed weed seeds or the hulls thereof, which greatly detract from its value.

The Sussex School Garden

This is one of the ways in which the boys and the girls are being interested in farming operations.

Turnip Thinners.

The designing of labour-saving machines for use on the farm has always received much attention on the part of the engineer. Machinery is now a matter of considerable importance to the agriculturist, and few farmers dare neglect to use every opportunity for keeping themselves abreast of modern developments.

None can deny that not only is the use of machinery extending, but that the newer designs which are continually being introduced are each so much more efficient than those which they supersede as to render it a matter of wonder that any further improvement could be made. And yet the succession of new patterns continues with bewildering rapidity. One has only to sit down and recall the types and designs of the machines which were in use in the early eighties and compare them with those of the present day to realize the advances that have been made. There is a difference, for example, between the constructioo of one of the early side delivery corn-dressing machines of the hand-operated type, in which an additianal sweeping surface was obtained by applying an extra long bottom tray or sieve underneath the riddles through which the small grains and refuse passed into a spout below, and were delivered to one side of the appliance, whilst the grain passed over the tray into another spout, and was delivered on the opposite side of the machine, and that of its modern prototype. It is interesting to compare, for example, one of the clod crushers or rollers then in vogue with the patterns obtainable to-day. In the early types it was claimed as a remarkable achievement that a solid wrought iron frame with steerage wheel and guide had been substituted for the older wooden framework, and that the design was such that a man was enabled to drive three horses abreast and steer the implement with great nicety without other assistance. It was a matter for self-congratulation on the part of the makers that in the new pattern each horse did its fair share of the work, and that no undue strain was thrown on the shaft horse.

The development of almost every class of agricuftural machinery has been surprising. Clover-dressing machioes, seed separators, corn drills, turnip and manure drills, harrows, horse hoes, bean and maize mills; all alike have been improved from the earlier types almost beyond recognition; but it is curious to note that no turnip thinning machine has yet been devised which has proved entirely satisfactory in action.

Practically every firm of agricultural implement makers has devoted a large amount of time and money to designing a machine which should deal satisfactorily with the difficulties of turnip thinning. Many appliances have been devised, some of which have been placed on the market. The majority, however, have proved unsatisfactory in action, too complicated or expensive, or else have never emerged from the experimental state. The problem of designing a perfect machine is rendered the more difficult in that the result aimed at is opposite to that which the agricultural engineer usually endeavours to achieve. Instead of aiming directly to increase production, the object is to reduce it; to decrease in the first place the number of growing plants with the object of obtaining ultimately better crops, rather than to make certaia that every seed sown is given an opportunity of coming to maturity.

Every farmer is aware that the turnip family require careful handling, and no method of planting has yet been devised which will appreciably lessen the labour of thinning, and yet secure good crops. Single seed sowing has been tried repeatedly, but the results invariably have been poor, transplanting cannot be carried out. The mament a plant is removed from the soil the roots seem to lose an amount of vitality which they never regain, even if the transplanting is carried out immediately under what seem perfect conditions. In the absence of satisfactary mechanical hoeing machines it would appear that there is nothing for the farmer to do but to continue the tedious and expensive process of hoeing by manual labour.

Amongst the machines which have been devised for turnip thinning, there are some which are worthy of special attention. In one the machine consists of an horizontal frame with a main traverse shaft or axle, with a pair of travelling wheels by which the shaft is rotated, and which is provided with a spur wheel, gearing with a spur pinion located on a second motion shaft provided with a loose bevel wheel, which is thrown in and out of gear with its shaft by the medium of a clutch. The bevel wheel gears with a bevel pinion located on a longitudinal shaft placed at right angles to the second motion shaft. The opposite end of this long tudinal shaft carries a disc provided with a crank pin, on which is mounted a double-ended arm or rod to the lower end of which is attached adjustably a hoe or thinner blade, whilst the opposite end of the rod is connected through the mehium of a radius link to a standard fixed on the main frame. To the front portion of the latter is attached an adjustable arm provided with a front swivel wheel to the socket of which is attached avertical bar provided with an adjustable link to which the swingletree is attached and by whicn the machine is drawn. In other patterns the front swivel wheel is omitted and shafts used instead, whilst to the rear portion of the main frame a pair of handles for guiding are attached.—Basil Barham, A. N. I. E. E., in Farm and Home, England.

The cow testing association is no longer an experiment. It should have a place in every live dairy community for it is the most efficient and complete system of detecting the unprofitable cow that has yet been devisen.

Making money on the farm is a possible thing if one simply applies himself and knows how to turn the trick, but there are thousands of men on the farm today who will never be seen making money any more than thousands of men who are in the shops.

Spraying Mixtures and Spraying

Address by Prof. L. Caesar, Before N. S. F. G. A., at Kentville

It would be foolish or of little profit on an occasion like this to attempt to discuss many mixtures so that I shall confine my remarks to those that to-day are proving or have proven themselves of most value.

FUNGICIDES.

Until about two years ago lime-sulphur and Bordeaux Mixture were the only fungicides in use worth mentioning. Since then Soluble Sulphur has been much boomed by the Niagara Sprgy Co., and a gpod many fruit growers in Eastern North America are testing it. You will naturally therefore wish to hear what we in Ontario have to say of this spray material.

Soluble Sulphur is a chemical compound of Sodium carbonate and Sulphur. They are heated together at 400 degrees F., then apparently cooled down and ground. The subseance is a greenish yellow coarse powder. It is very convenient to ship and store. When placed in water and agitated it soon dissolves. In cost it is about the same as commercial Lime-sulphur. This last season I tested the mixture for San Jose Scale and also for Apple Scab, and found it fairly satisfactory. Several others also reported favorably, but in some cases light, and in some cases severe, burning of foliage followed. From the Entomologist of the Experiment Station at Geneva, N. Y., I have received word that in a number of cases very severe burning resulted from its use in that State. burning took place when Arsenate of Lead was used with it. I shall, therefore, advise the growers of Nova Scotia as I do now not to rely too much on this new mixture until it is tested further under a wider range of climatic conditions. I thinu probably it may be valuable spray for some purposes but I doubt whether it will displace Bordeaux or Lime sulphur as a spray for orcharh trees after the foliage has appeared.

Bordeaux Mixture. So far as I can judge by what I have observed and read Bordeaux Mixture is the best preventative of fungus diseases known. It has, of course, two or three great drawbacks: First, if used after the blossoms have fallen it will in many seasons seriously russet and deform the fruit. Second, it sometimes causes so-called yellow Leaf. Third, it is a good deal more inconvenient to use than commercial or home-made lime-sulphur after the latter has once been made. On the other hand the fact that we may, if we wish, safely use Paris green or Arsenate of lime with it lostead of Arsenate of lead, it is of considerable advantage on some occasions. For potatoes—and every farmer grows potatoes—I should use no other fungicide than Bordeaux. It is much superior to lime-sulphur for these. But we are concerned chiefly with apples and you doubtless are waiting to hear what my opinion is as to the use of Bordeaux on them. I candidly confess that while I intend, myself, to continue to use lime-sulphur in place of Bordeaux on apples and pears that will not urge others in Ontario to change back, yet I shall openly state to all that in any district where apple scab is regularly or frequen(ly difficult to control they would, in my opinion probably be acting wisely in using Bordeaux instead of lime-sulphur for the application just before the blossoms fall because of the great danger of russeting the fruit severely. The application just before tne blossoms open is always a very important application in wet cold springs and on such occasions the best possible fungicide should be used. Lime-sulphur, however, in our province of Ontario, if applied thoroughly at the times recommended in our spray calendar has in all but a very few cases proven itself a satisfactory fungicide, and its greater convenience will be almost certain to cause the mass of our growers to continue to use it in preference to Bordeaux. It is very seldom that seasons so hard to control Scab in as this last one, will occur and in any ordinary year lime-sulphur in Ontario at least is just as satisfactory as Bordeaux. Since coming among you I find that Prof. Blair's experiments seem to show that for Nova Scotia this year lime-sulphur has given better results than Bordeaux. So that it is impossible for me to boldly recommend the one mixture as superior to the other.

Lime Sulphur. The great advantage of lime-sulphur and the chief thing that has made it so popular in Ontario is its power to destroy both San Jose and Oyster Shell Scale, and also the blister mite in addition to its power as a fungicide. It has also other attractions in that itprevents the growth of lichens and moss on trees, wards off to a considerable extent cankers and once made is remarkably convenient to use, all that is necessary being to dip out the required amount, pour it into the tank and add the necessary water for dilution, adding of course, Arsenate of lead when needed. This by the way, I suppose you know, is at present about the only safe poison to use with lime-sulphur. Paris green or Arsenate of lime will sometimes, if used with it, burn the foliage very severely.

You will perhaps be interested to hear that Mr. Bradt, a recent college graduate, proved this year that strong lime-sulphur applied soon after Tent-caterpillars hatch will destroy them even without Arsenate of lead.

The difference in cost between lime-sulphur and Bordeaux Misture for use after the leaves appear is very small.

Almost every fruit grower in Ontario puts in an early spray application just before the leaf buds burst and for this, we believe that, unless soluble-sulphur may take its place there is no mixture half so satisfactory as strong lime-sulphur, say one gallon diluted with water to from 8 to 10 gallons. Having therefore to get lime-sulphur for this application we naturally think it desirable if possible to use it for the other two or three applications also. In Nova Scotia I understand that most growers admit this early application.

INSECTICIDES.

As insecticides for biting orchard insects we are using almost exclusively Arsenate of lead. You would naturally infer this from the fact that that this is the only safe arsenical at hand to use with lime-sulphur. For potatoes most of us are using Paris green with the Bordeaux. Many think I make a mistake in not recammending Arsenate of lead in preference to Paris green for these, but I find the average man gets better results from the Paris green.

Far sucking insects apart from those that are killed by lime-sulphur we seldom use any spray mixture, though a good deal of Black Leaf 40 has been applied of late years with or without lime-sulphur for aphis. Black Leaf 40 is very costly. We usually find it amounts to 80 cents per 40 gallon barrel. It has occurred to me that it is just possible that a fairly good mixture against aphids might be made by combining about 5 lbs. of any common laundry soap with each barrel of diluted soluble-sulphur and applying it either just after the aphis have hatched or just after the buds have opened and the little leaves unfolded so that the aphids may not be hidden among them when opening. Soap cannot be combined with lime-sulphur. I believe Prof. Brittain will test for you this new suggested mixture and let you know whether it is safe and efficient.

Kerosene emulsion and whale oil soap are occasionally used against sucking insects like aphids and are effective, but too costly.

WHY WE SPRAY.

Before discussing how often to spray and the best methods of doing the work let us first consider for a little why we spray as this will help to explain some of the things to be said later.

The following will be found to be the main reasons for spraying:

1. To keep the fruit clean, free from insect injuries and fungus diseases, so that it may be more attract ve, keep better and bring a higher price.

2. To prevent the fruit from falling prematurely and thus to obtain a heavier crop in years of otherwise often light yields.

3. To keep the trees themselves healthy, and vigorous thatthey may live longer and produce more fruit.

The first of these reasons is the one that most of us think of, and we forget the second and third, but if we consider them we shall find that they are also very important. One of the main causes of the early falling fruit and of the poor yields in years like this is that apple scab attacks the stems of the fruit while this is still very small and causes it to fall. How Home Mixing Makes European Farmers Prosperous

They buy straight materials and mix them into balanced fertilizers containing two or three times as much

Nitrate of Soda

as high-priced American complete fertilizers contain. Your fertilizer should contain 4% of active nitrogen. Does it?

On land farmed for centuries, England raises 33 bushels of wheat per acre. We raise but 14. Europe imports 100% active Nitrate of Soda. You use dried blood, tankage only 60% to 70% active and you pay more for it.

"Home Mixing" is a book to help you increase your yields. Send your address to me on a postal card.

POTASH | NITRATE OF SODA | SUPER-PHOSPHATE

Eureka Potato Planter

Catalog sent free

No matter whether you grow large or small quantities of potatoes we have a size of planter that is just what you need. The Eureka line of Potato Planters is the largest manufactured. This machine takes only *one* man to operate it. That means less trouble and expense for *you.*

Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if desired)—covers up—marks for next row.

It's an easy machine to operate. The steel and malleable iron construction mean lightest possible weight and increased life of machine. Your repair bill will be practically nothing. Plants uniform depth at *all* times because plow is directly under the axle. Dropping mechanism in plain view of driver. Does not injure seed.

We supply planters in three sizes, for one or two rows—with or without Fertilizer Attachment.

For 15 years the Eureka Potato Planter has been successfully used throughout the world.

We also make Eureka Potato Cutters and the Eureka Mulcher and Seeder—a mulcher, smoothing harrow, cultivator, weeder, seeder.

Chamberlain's Cough Remedy has won its great reputation and extensive sale by its remarkable cures of coughs, colds and croup. It can be depended upon. Try it. Sold by all dealers.

attack on the stem may begin as soon as the blossoms have opened and mgy be well advanced by the time they are off. Moreover, any who have observed the work of the Plum Curculio and Codling moth wil, know that these insects do a great deal to cause fruits to ripen prematurely and drop. Now, thorough spraying can largely prevent the scab and destroy these insects and therefore save the fruit from falling.

That spraying will also do much to keep a tree healthy and vigorous and so able to bear larger crops can be readily understood if we remember that it will destroy to a large extent the scale insects that suck the juices out of the trunk, and branches, juices which would otherwise go to feeding the tree itself. It will also destroy most of the biting and some of the sucking insects that damage the leaves, and it will keep the scab or leaf spot from causing dead areas in them. We shall therefore from good spraying have healthy, clean, intact foliage. This is one of the greatest importance to the vigor of the tree because all the food of the tree is manufactured in the green parts and so chiefly in the leaves and tnerefore spraying by keep ng these healthy is a means of insuring the health of our trees.

SHOULD YOUNG TREES BE SPRAYED?

The last reason given above for spraying shows clearly that it is necessary to spray young trees even the first year they are set out if we want them to thrive. The fact that they do not have blossoms makes it easier to spray them just a little in advance of or a little after the bearing orchards. It takes very little time to spray 1000 such trees. They should receive practically the same number of applications as the older trees.

HOW OFTEN AND WHEN TO SPRAY.

It is difficult for one who has not lived in Nova Scotia to advise you on this point, and not run the risk of making some mistakes. You will in the meantime think over my suggestions and try to see how far they should be adopted. We shall, I believe, all agree on at least two of the applications; namely, the one just before the blossoms burst, beginning with the earliest varieties, and then going right on with the later, and the other just after the blossoms have nearly all fallen, say, 80 to 90 per cent. of them off. Without these two in a wet, cold May or June no one need hope to control apple scab. One of these is almost as importaot as the other. As to the other sprayings necessary there will be a difference of opinion. I believe you should also always make one earlier application. When this application should be put on is a debatable question. If you have Oyster Shell, Scale, Blister Mite or much canker to combat it should be before the buds burst or just as they are ready to burst. If these th ngs are not troublesome I should feel like suggesting that the spraying be done not before but as the buds are bursting, or have just burst. So that the unfolding leaves may be covered with the spray mixture and protested against Scab until th? application just before the blossoms open can be given.

As for any later sprays one must be guided by the weather. I think it probable that it will pay to spray again about ten days after the Codling Moth spray, which is, of course, the one just after the blossoms fall. It seems to me that better results will not be got by not waiting for the full two weeks as ordinarily recommended because each week after the blossoms fall the danger of Ap-

Warts.

Last summer a wart started growth below the eye of a two-year-old grade Ayrshire heifer. It grew until it became the size of a hazelnut when it was taken off by coming into contact with a wire fence. Since then warts have started all over her body. She is now carrying twenty-four of these warts, varying from the size of a pea to the size of a man's hat. There is one on her abdomen extending from the teats to the front of the naval, that is nine ioches wide and five inches deep. It seems to increase in size and an offensive odor is emitted. Is there anything that will take off the wart or is it worth while spending time and money on her? Are warts contagious with other cattle? I have a heifer in another farm that is carrying a few small warts. I put caustic potash on them this week which made them turn red. The heifers have lost flesh since the warts started to grow.—R. J. S., York Co., N. B.

Ans. Warts are what might be commonly termed skin tumors. Cattle are affected with two varieties. One, the verruca vulgaris, is composed of a cluster of enlarged papillae covered with a thickened epidermis, the number of papillae determining the breadth and their length its height. Occasionally large numbers grow from the tender skin of the ears, the lips, the eyes and the vulva.

Another variety, the verruca acuminata are irregularly shaped elevations tufted or club-shaped existing as thick, short, fleshy excresences af a red or purplish color. Often by friction they become raw and bleeding, emitting an offensive odor. They usually grow in clusters and develop rapidly.

Warts are caused by an abnormal nutrition of the skin determined by increased energy of growth operating on a healthy skin. At other times the growths may operate on a weak or impoverished skin.

Treatment:—When warts are small they may be snipped off with shears and the stumps touched with nitrate of silver, butter of antimony or with a mixture of equal parts of boric acid, tannin and calcined alum. When they are broad and flattened they can be dissected out and the wound cauterized if necessary. If they are large they may be segregated and by tying a strong string around the base tight enough to prevent circulation they will snrivel, die and drop off. If there is a tendency to grow again, dress them with butter of antimany once every three days until cured. Small warts will often d sappear if kept soft with lard, sweet or olive oil.

It is rather suggestive that in young animals one wart as a general rule leads to many others, aod it has been shown that warts are contagious in many cases, not only between animal and animal, but sometimes between animal and man.

In cases where they are numerous, the patients become reduced in condition. Sometimes the warts become infected and suppurate, and may give rise to complications such as septic poisoning. As a rule, however, warts are not dangerous to life, but they diminish the value of the animals, particularly that of milch cows.

Internal medication is not of any great value, although there is no doubt that one ounce of Fowler's Solution of Arsenic given twice daily morning and evening in chop, has a beneficial result. This treatment can be continued for one or two weeks, after which it should be discontinued for the same period, and then repeated if found necessary.

Some writers favor painting over the warts daily with the same preparation. There is no doubt, however, that the most effective treatmeot is the radical one of excision. This, af course, is somewhat troublesome and requires a man of experience. I have personally, however, removed many pounds of warts from one animal at one time without any injurious effects.

It is well to apply a mixture of equal parts of Boric Acid, Tannin and Calcined Alum to the raw surface after the removal of the warts.

Reply by Geo. Hilton, Acting Veterinary Director General and Dr. J. Standish, V. S., Truro. N. S.

The Berkshire Pig.

Berkshires are common to the South-west of England, although they are found in every county, and are bred more generally than with us; but I have never seen them on a continental farm. The history of the breed is an interestiog one, but I prapose to refer to its utilitarian value in these remarks. Some of the earlier specimens of the breed reached 6 ft. in length, but this was before the advent of the modern type, which, compared with the large breeds, is too small. Whatever views are held by Berkshire breeders, this fact remains that German, Danish, and Continental buyers generally prefer the Large White. Had the Berkshire been large enough there is reason to believe that the Large Black breed wauld have failed to find a place.

There are three questions relating to the modern Berkshire which are

MARKINGS ON BERKSHIRES.

needing solution if the breed is to maintain its high position. I refer to its marking, its colour, and its size. Some years ago the Berksnire Society recommended that all pigs which were exhibited for prizes should be disqualified unless they were properly marked—i.e., unless the white on the feet, the face and the tip of the tail was distinct. Obviously in breeding for sale marking becomes imperative in the stock, with the result that it is far more difficult to find boars and sows which are approximately perfect. However large, lusty and well formed, however good the quality of the pig, it is disqualified if the marking is faulty, and this applies almost as freely to the breeding stock of the farm. If, on the other hand, we were told, by the Berkshire Society, that exhibits would be disqualified unless they reached a standard size, without regard to markings, or that size would be regarded as important a point as in the recognized Large varieties, very little time would elapse before we should see an improvement both in size and quality. Establish a large breed and no difficulty is experienced in maintaining it, but once insist that the pigs must be marked in a definite way and you commence to lose it at once. I have every reason to believe from a study of the history of the breed that the earlier Berkshires were much larger than those of to-day; but it is not surprising that they have lost this very valuable qualification in the effort of breeders to comply with the standard of marking.

COLOUR IN BERKSHIRES.

The next question relates to color. There are Berkshires which are black—I mean a dense solid black—with plenty of rather coarse hair, and tnere are Berkshires which are a dark plum, tinted black with finer hair. The former always appear to provide more lean in proportion to fat, an important point in a bacon pig, while the latter equally appear to fatten more rapidly and to produce more fat in proportion to lean

EWING'S RELIABLE SEEDS

Reproduce the Choicest Stock

"Like produces like".

Given proper soil and care, Ewing's Seeds will reproduce, in your own garden, before your delighted eyes, the choice, selected vegetables and flowers from which they themselves grew.

Breeding counts in plants as well as in animals, as Ewing's "pure-bred" seeds have been demonstrating by splendid crops for over forty years.

In all cases the cash with your order.—F.18-w2mos.

POTASH

For All Crops On All Soils

POTASH is an Indispensable Plant Food

No soil will produce a maximum crop unless it contains a supply of available POTASH sufficient for the crop's requirements. POTASH is the dominant ingredient in a fertilizer for Potatoes, Tobacco and most Fruit and Vegetable crops and is essential to all other crops.

MURIATE OF POTASH AND SULPHATE OF POTASH can be obtained from the leading fertilizer dealers and seedsmen. Buyers of "Ready-Mixed" fertilizers should purchase brands containing a high percentage of POTASH.

A new edition of "ARTIFICIAL FERTILIZERS; THEIR NATURE AND USE" has been prepared. This is a complete treatise of 80 pages on this important subject and contains a complete index. This is a most helpful bulletin in the intelligent study of fertilizers and the fertilizing of the various crops. It will be sent FREE on request, together with any of the following:

"The Principal Potash-Crops of Canada."
"Fertilizing Orchard and Garden."
"Fertilizing Grain and Grasses."
"The Potato Crop in Canada."
"Fertilizing Hoed Crops."
"Farmer's Companion."

FITS CURED Send for Free Book giving full particulars of TRENCH'S REMEDY, the world-famous cure for Epilepsy and Fits—Simple home treatment—25 years success. Testimonials from all parts of the world; over 1,000 in one year.

TRENCH'S REMEDIES Limited
434 St. James Chambers, Toronto, Can.

You judge a man not by what he promises to do, but by what he has done. That is the only true test. Chamberlain's Cough Remedy judged by this standard has no superior. People everywhere speak of it in the highest terms of praise. For sale by all dealers.

In both cases the pigs are too small, and although of excellent form where they are well bred, they are also apt to produce too much fat. The leading exhibits at Smithfield and other winter fat stock shows will emphasize this remark. Such pigs are not economical, and generally realize very low prices. How unwise therefore to produce them and still more to provide them with prizes. I know of nothing in the economy of the showyard which is a greater mistake than to admit the excessively fat pig, which nobody wants, and, indeed, to encourage it by the offer of prizes. What should the colour be? To me the plum-colored black is the most typical, and carefully-bred pigs of this tint are the most perfect in form and might be made perfect in quality.

AS A BACON PIG.

Although the Berkshire is a good bacon pig—taking good specimens as a standard—it grows too slowly to be fit for the curer in such time as fits the large breeds for the knife. There is no doubt about the fact that the modern Berkshire if the result of crossing during the past forty years. Berkshire men have themselves admitted it to me. The most important crosses were made, as I believe, with the Black Suffolk, which was short, thick, small in head, and excessively fat. While imparting its bad properties it imparted no good ones, unless we can recognize the changed exhibition type. Sixty years ago the Beekshire walked to market, it produced nine to twelve pigs at a litter, was more dished in the face, hardy, and a producer of excellent bacon. Quite apart from the Berkshire standard, judges are wanted who are strong enough to ignore over-fatness as a claim to a prize, and to insist on larger size. It remains, however, for breeders themselves to decide the points of color and marking.—James Long.

First Aid in Live Stock Complaints.

As with the mother in the household so with the farmer and his livestock, the ability to render immediate aid in illness or accident is an asset of priceless value, and might, I think, be cultivated a great deal more than it is. Indeed, a certain amount of veterinary surgery should form an important part of the instructian given under the new system of agricultural education. Even in these days, in thickly populated England, many farms are miles away from the nearest veterinary and before he can arrive cases which, if treated at once might have been saved, have gone too far for his skill to be effective. Moreover, with the aid of a stock of simple medicines, which can be promptly administered, the doctor's services might often be dispensed with and his bill greatly diminished in length. There are many common ailments easily amenable to home treatment, and other more serious ones which might be nipped in the bud. Take colic in horses and cattle, husk in calves, foot-rot, and even scab in sheep. All these will yield ta amateur doctoring, intelligently and promptly applied. There are several firms whose wares are supplied in convenient form, and quite effective too, which no live stock owner should be without, and which the most ignorant person may use with safety and success. I am not "speaking without the book" in this matter, or with lack of practical experience. For many years I kept my own medicine chest, and by its means I am sure I saved many lives and also many a bill from the veterinary, but I do not say that in cases he should not be immediately called in.

INTERNATIONAL Harvester manure spreaders have a score of good features in their construction. Each one is the result of careful field experiment.

An I H C spreader is low enough for easy loading, yet it has plenty of clearance underneath. The rear axle is well under the load, rear wheels have wide rims and Z-shaped lugs, insuring good traction under all conditions. Frame, wheels, and all driving parts are of steel. Apron tension is adjusted by a simple device. Winding of the beater is prevented by large diameter, and beater teeth are strong, square and chisel-pointed.

International manure spreaders are built in several styles and sizes, low or high, endless or return apron, for small farms or large. Examination will show sturdiness of construction in every detail. Repairs, if ever needed, may always be had of the local dealer.

Examine International spreaders at the dealer's. We will tell you who sells them, and we will send you interesting catalogues.

DAIRYING.

Regular Exercise is very Essential for the Daiy Cow.

The general opinion held in this country by dairymen that cows should lead a quiet and inactive life would seem to be a question worthy of careful consideration. Experiments carried an in parts of Germany where milch cows are used as beasts of burden plainly indicate the moderate exercise or light labor does not cause a deterioration of milk. This being the case, in many cases not only can the owner of dairy cattle receive an income from the milk produced, but at the same time, by using the cattle to perform tasks which are not overburdensome, can cut down his expenses in other directions, writes Maud De Witt Pearl in the Breeders' Gazette.

The various investigations in Germany are based upon an analysis of the content of the milk during working periods and periods of rest. It was generally found that during the working periods the amount of milk produced was lessened but that there was an iocrease in the dry substances; namely, albumen, casein, milk-sugar, mineral salts and fat. The following table gives the results in the case of two cows of the Harz race, under investigation at the Agricultural Institute of the University of Leipzig. The quantity and quality of their milk was recorded da ly for the rest period of one week, when they worked from nine to ten hours each day.

Cow No. 1.

	During work.	During rest.	During work more X or less—
Pounds of milk	19,153	20,912	—1,759 lbs., 8.41 p. c.
Per cent of dry substance	13,330	13,003	X0.327 p. c.
Per cent of fat	4.38	4.01	X0.37 p. c.
Total pounds dry substance	4,718	2,550	X168 lbs.
Total pounds of fat	839	837	X2 lbs.

Cow No. 2.

Pounds of milk	10,469	11,505	—1,036 lbs.
Per cent of dry substance	13.316	13.232	X0.84 p. c.
Per cent of fat	4.28	4.17	X0.11 p. c.
Total pounds dry substance	1,347	1,333	X104 lbs.
Total pounds of fat	427	449	—22 lbs., —5 p. c.

According to the table the amount of milk is slightly reduced in each case during the working period, fram 8 to 10 per cent less being produced than during periods of rest. But in spite of this reduction in quantity the quality shows an improvement. There is a decided increase in the dry substance of the milk, except in the case of cow Number 2, where there is a slight decrease, about 5 per cent, in the fat cantent.

Other investigations show the same to be true. In a contest in Wurtemburg the so-called working cows, 85 in number, stood at the head of those entered in the competition. These cows worked for a period of 36 days during the year. While the yearly milk production showed a decrease as compared with those cows remaining in the stall yet in the dry content of the milk there was a decided increase. A fat content of 4 per cent. and over was showed in 37 out of the 85, 3.5 to 4 per cent. in 39, and 3.2 to 3.5 per cent in 9. The effect then of the cows' activity is to reduce the water content of the milk but to increase the substances which make for richness. In connection with these results, observations made upon herds of cattle doing violent exercise, such as climbing up the Alps for 6½ hours to the feeding ground, show that exercise may be overdone. Upon arival at the pasture the cows are milked, the quantity and quality of the milk showing almost no deterioration. The second milking made some 12 hours later showed a very great deterioration in the quantity as well as some reduction in the dry substances, particulgrly in the fat content.

Cows which are taking a moderate amount of exercise must be fed just as carefully as those remaining in the stalls. The food must be abundant and nourishing and they must be given ample time in which to eat it. Apparently the cows can be kept active for some hours daily provided the tasks be light. But in no case should the cows be required to do heavy labor, even for a short time. In the experiments in Germany the cows mainly did light hauling. The farmer who sells whole milk will find it more profitable to keep his cows quiet but those who are not concerned with the quantity of the milk produced so much as with the quality might do well to make a trial of the German results. Particularly in the great cheese and butter areas would it seem of value to the dairyman to provide some form of regular exercise for his cattle.

In this country where farming conditions are so different from what they are in Europe it would be less feasible to have the cows do labor on the farm but it is easily arranged of exercise daily. A little considera- so that the cows get a fair amount tion enables one to see tnat light labor or exercise should not be injurious to the milk-producing cow. Any creature, man included, is in a better condition physically for some exercise. It has long been known to physicians that the mother who is nursing her child, in order that she give the most nourishing food, not only have a wholesome and strengthening diet, but that she take a moderate amount of exercise in the open. If this rule applies unfailingly to the human race, why should it not apply equally well to those animals which aee bred for the particular purpose of producing one o, the most necessary articles of our diet?

Maritime Ayrshires in the Record of Performance.

In the list of Ayrshire cows that have been registered in the Record of Performance since their last report was issued up to February 19th 1914, we find the following:—

Mature Class—Milkmaid 7th-28769-lbs. milk, 16,696; per cent fat, 4.36; lbs. fat, 729; duration 365 days. Owned by A. McRae & Sons, Charlottetown.

Spicy Lucy-35903-lbs. milk, 12,645; per cent. fat, 3.77; lbs. fat, 477; duration, 365 days. Owned by A. McRae & Sons.

Lady Kirsty of Klenord-19571-lbs. milk, 9031; per cent. fat, 4.34; lbs. fat .392; duration, 365 days. Owned by Easton Bros., Charlottetown, P. E. I.

Four-Year-Old Class—Belvideu Princess-28375; lbs. milk, 7787; per cent. fat, 4.86; lbs. fat, 379, duration, 316 days. Owned by A. McRae & Sons.

Three-Year-Old Class—Miss Wylie-28176; lbs. milk, 8,757; per cent. fat' fat, 4.87; lbs. fat, 427; duraotion, 365 days. Owned by Samuel C. Crocket, Middle Musquodoboit, N. S.

Test 3.0 or 4.8 Which ?

Editor Maritime Farmer:—

One of the chief reasons for testing cows not simply once in a while, but at regular intervals, is found in the fact that they are known to vary so greatly and often so inexplicablyf Apart altogether from what are term ed normal variations from milking to milking, bes des the variations between morning and evening, and the variations between the fore milk and the stripuings, careful observers have noticed in two days a variation in the test of almost two per cent. of fat in the milk of individual cows, for which no reason can be assigned.

Obviously then it would be quite unfa r to judge any cow on any one isolated test when it might be 3.0 one day and 4.8 another day. Which

DON'T LET YOUR WIFE BEND OVER A WASHTUB

all day, rubbing and scrubbing in a hot, steamy wash-house. Think of the drudgery—the backache—the serious illnesses too often caused by chills. Avoid this! Get her a

Maxwell

"HIGH-SPEED CHAMPION" WASHER

and ease this burden and save money. Clothes washed cleaner and whiter in half the time. A dry, clean floor, too.

Go with the wife to the nearest Maxwell dealer and see the Maxwell "High-Speed Champion." Notice how easily it works—almost runs by itself. See the lever at top, and crank handle at side. Both equally easy. There's not a better washer on the market than this. It means lighter work and better health. Also enquire about our Washers for Water, Electric or Gas Engine Power.

The Secret of good butter making is the Salt used

Windsor Dairy Salt

115

could you take? A fair and just way is to take samples regularly and test a composite sample once a month. Then there will be credit given when it is really due, not necessarily to the one that is supposed to be a high tester, because she is of fancy name or fancy price, but frequently to some tacitly despised individual which is really the queen of the dairy. It will pay to select those cows that are known, not supposed, to yield milk rich in fat.—C. F. W.

N. S. Aryshire Breeders in British Columbia Organize.

Another Ayrshire Club has been organized which makes 5 such Clubs now in Canada. This time it s the Ayrshire breeders in British Columbia that have organized and from what we know of the Ayrshire breeders there they are a wide-awake, energetic lot of men and we expect to hear good reports from the sun-set province.

Where such Clubs have been organized for any length of time there has been a marked progress made and increased interest in the high-class cattle. We look for several such clubs to be organized in Eastern Canada and the Middle West during the coming year.

The Club just organized in British Columbia has a membership of about 35 with the following officers:—

Hon. President, A. C. Wells, Sardis, B. C.; President, S. H. Shannon, Cloverdale, B. C.; Vice-President, E. A. Wel,s, Sardis, B. C.; Sec'y-Treas., W. T. Macdonald, Victoria, B. C.; Directors, G. Nutter, Duncan, B. C., T. Cunningham, Nanaimo, B. C., Geo. Sangster, Victoria, B. C., S. P. Chaplin, Agazziz, B. C., H. W. Vanderhoof, Huntingdon, B. C., J. J. Campbell, Nelson, B. C., N. C. Calder, Revelstoke, B. C., J. A. Pringle, Cranbrook, B. C.—W. F. Stephen.

Official Records.

In the list of mature Holstein-Friesian cows that completed seven day records between February 1st and February 14th we find Artis Rosie, 9808, age, 6 years, 3 months and 23 days; lbs. milk, 624.4 cantaining 18.-94 lbs butter fat, the equivalent of 23.68 lbs. butter, 80 per cent. fat. Artis Rosie is owned by the Nova Scotia Agricultural College, Truro,

Essentials for Successful Feeding of Dairy Cows.

1. Keep the cow the year around under the conditions of early summer. To do this observe the following:

2. Feed an abundance of palatable food. If the cow does not respond sell her. The greatest mistake made in handling cows in Missouri is under feeding.

3. Feed a succulent ration. Build a silo and feed corn silage in winter which helps to make summer conditions the year around.

4. Feed a balanced ration To do this feed corn silage, clover, alfalfa, cowpea hay. Timothy hay, corn fodder and corn is a poor ration for milk. It is improved by one-half pound of cottonseed meal pet day.

5. Feed the cow one pound of grain for each three pounds of milk she gives.

6. Imitate summer conditions by keeping the cows in comfortable quarters and at a moderate temperature.

Potato Profits

depend largely on how the crop is planted. Every skipped hill is a loss in time, fertilizer and soil. Every double wastes valuable seed. It means $5 to $50 per acre extra profit if all hills are planted, one piece in each. That is why

IRON AGE 100 Per Cent Planters

often pay for themselves in one season on small acreage. They also plant straight, at right depth, 12 to 24 inches apart. With or without fertilizer distributor. Ask your dealer to show you this Planter and write us for booklet, "100 Per Cent Potato Planting" and copy of Iron Age Farm and Garden News.

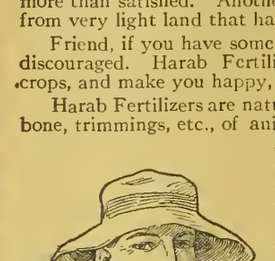
Scores, yes hundreds, of my farmer friends have got bumper crops from soils they thought were worn out. They now swear by

Harab FERTILIZERS

One of them, A. Robinson of Rosemount, tells me that he used Harab Fertilizers on potatoes and turnips without any manure on the land which was very old and poor. He got a bumper crop and is more than satisfied. Another man, D. J. Ferguson, got a grand crop from very light land that had been hard run by tenants.

Friend, if you have some poor land, some worn-out soil, don't be discouraged. Harab Fertilizers will make that soil yield bumper crops, and make you happy, or my name isn't Progressive Jones.

Harab Fertilizers are natural Fertilizers, manufactured from blood, bone, trimmings, etc., of animals slaughtered at the immense Harris Abattoirs. To these are added Potash and just enough quick-acting Nitrates and Superphosphates to start the plant off with a vigorous growth.



The cost of using Harab Fertilizers is small. The results are big. Write to The Harris Abattoir Co. for their booklet. It gives the information you want to know.

Yours for bumper crops

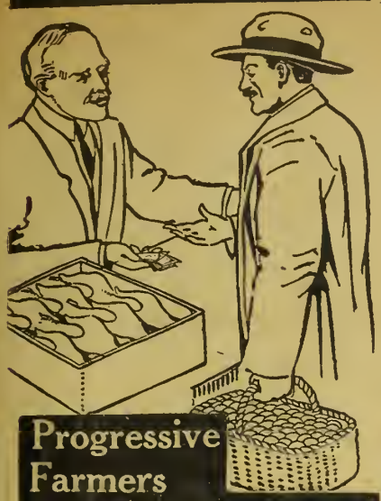
RED ROSE TEA "is good tea"



Progressive Farmers Make Handsome Profits from Poultry

THE stoutest advocates of Poultry-Raising on the farm are the progressive farmers who have investigated the Peerless Way. These men are alive to the fact that Canada does not produce one third of the poultry and eggs consumed in this country, and that handsome profits go across the border to the American farmer who is called upon to supply the shortage.

You, Mr. Farmer, can have this profit, plus the amount spent in Customs duties and long freight hauls importing eggs and poultry from the States, and you will always have an eager market waiting to buy up all the poultry and eggs you can raise.

Read what this British Columbia farmer says:

Greenwood, B.C., Dec. 1, 1913.

"I am pleased to report a good season for the past summer with the poultry . . pullets are just commencing to lay. Eggs hatched well and I raised practically all in the Brooder and only lost (1) chick out of 500 hatched. I sold 20 dozen baby chicks and am keeping over 150 pullets, as it is the egg trade that I am working up.

"Since last September, eggs have been selling here at 70c. per doz., and at present they are bringing 80c. and are very scarce too."

(Sgd.) A. R. Royce.

The Peerless Way Makes Poultry Pay

The whole idea of the Peerless Way of Poultry Raising is to raise the greatest number of the strongest chickens at the least outlay of money and with the least expenditure of time. We know that a farmer's regular duties do not leave him much time to look after chickens, so we have bent all our energies to perfecting a system whereby a farmer can take care of 400 or 500 chickens the Peerless Way in less time than he can look after 30 or 40 the old way.

Build Concrete Crib Floors and Supports

THEY keep the rats, squirrels and other rodents from carrying away your profits. Millions of dollars are lost to farmers each year through the ravages of rodents in cribs and granaries. Part of this loss is paid by every farmer whose crib floor isn't built of concrete.

Concrete crib floors and supports stop the waste because

They Protect Your Grain

Concrete is strong, durable and clean. It never wears out and needs practically no repairs. It is the cheapest of all materials for cribs and granaries.

Write for this free book "What the Farmer can do with Concrete." It tells all about the uses of concrete and will help every farmer to have better buildings and save money.

THE HORSE.

The Development of Horses.

Horses continue to grow in height up to the age af five, but they do not, broadly speaking, reach full maturity until about six and a half years old, although something depends upon the class of horse, as horses of Shire or other heavy cart breed mature more quickly and become set at an earlier age than those belonging to the light-legged division. It is often reckoned that a horse has arrived at maturity when it becomes "full-mouthed," as it is termed, but that is quite wrong, for at that stage it is still some way off being properly matured. Horses get their ;'full mouth" when the last pair of milk teeth has been shed and all the permanent incisor teeth are up, this occutting when they are between four and a half and nearly five years old, the exact time when the corner permanent incisors displace the corresponding milk teeth varying somewhat with different animals. Those which are well developed and were born early in the season, and have been generously fed during colthood, generally change their teeth some months earlier than horses that were more backward in their growthi etc., as foals and yearlings. In extreme cases horses may be as much as six months later than others in shedding their milk teeth. Those that change their milk teeth comparatively early are commonly said to have a forward mouth. In the gelding the tushes also have begun to protrude when the permanent corner incisors make their appearance. The last are, however, only just through the gums when a young horse establishes its claim to be described as full mouthed and its mouth, as regards the teeth, is not nearly "full" or perfect until the animal is five or five off, as its takes some time for the upper and lower corner teeth to meet after their eruption, and to come into wear. On becoming full-mouthed, gelding and entires cease to be colts, and are henceforth known as horses, while fillies are at this stage designated mares.

THE INFLUENCE OF FEEDING ON GROWTH.

According to investigations that have at various times been made, it appears that roughly from three-fifths to three-quarters of a horse's total growth is made by the foal in the first year of its existence. Of the remaining fifth or quarter share of the growth about half is completed during the second year, while the rest is distributed over the tnird, fourth, and fifth years. These facts indicate how important it is that foals and yearlings should be liberally fed and well looked after, in order to promote size and development. Two and three-year-olds do not require so much care, as most of the growing is done by this time, and they can do with a relatively less nutritious diet, especially if they have been well done during foalhood and the yearling stage. Certainly it is only during the first two years, and particularly in the foal, that the rate of growth can be perceptibly influenced by the breeder by dint of generous feeding and comfortable housing in winter. After that but very little influence can be exerted in this direction, and, under average conditions, probably none at all after a colt is over two and a half years old, excepting in respect of bringing about more thickening and promoting muscular development. The legs of a colt grow very little in length after the end of t first year, as one can readily understand, in view of the fact that the foal is born with such disproportionately long legs. The actual growth made by the limbs after the foal is twelve months old, as regards their length, is only about half an inch or less, as demonstrated in some investigations relating to the rate of growth in the horse which several years ago were carried out by Professor Cossar Ewart. But they increase considerably in thickness.

APPROACHING MATURITY

As young horses approach maturity they thicken or furnish increasingly, becoming broader or more set in shape, and filling out in all directions, while they also "let down" very considerably, their body coming closer to the ground. This furnishing and letting down process alters them a great deal, ano greatly improves their appearance. In sizing up the make and shape of three and four-year-old horses one should always make plenty allowance for the improvement which they will still undergo as the result of filling out and lett ng down, a fact which is frequently overlooked. The improvement made in this direction is, to speak broadly, most marked between four and five years old, but it will very commonly continue until the animal is six off. Horses, more especially, are found to muscle up a good deal after they have completed their fifth year, which serves to give them a stouter appearance. Young horses under five that are leggy, or light in the middle-piece, or narrow in their quarters, may, in particular, be expected to improve in their shape when they have furnished more and let down. Sometimes they will improve out of all recognition in such cases. A thin neck, too, is a fault which one may reasonably expect a young, immature horse to outgrow as it reaches its prime. To condemn a four or even a five-year-old animal as being an inherently bad doer, and short of constitution, when it is herring-gutted, and will not put on much flesh in response to good feeding, as is frequently done in cases of this kind, is often most premature, for their is, under these circumstances, every chance of the horse gaining normal condition, proving itself a good thriver, and filling out nicely about the flanks and belly when it is a year or two older, as the trouble, as likely as not, is merely a temporary one, due to immaturity. Hand in hand with the outward improvement made by a young horse as it reaches maturity there goes an increasing access of strength and improvement in its working capacity. In fact, horses continue to get stronger and tougher for some while after they have ceased to fill out and improve outwardly, and they do not actually attain to their prime in point of strength and stamina until close on seven years old, this applying, at any rate, in the case of the light breeds.

WHEN IT REACHES ITS PRIME.

It is very generally considered that a horse has reached its prime and found its full strength by the time it becomes six years old, but that is hardly correct, for it is then only beginning to arrive at its prime, and not until they are seven, or nearly so, can horses be reckoned as fully "seasoned," although they may be quite equal to doing a full share of constant work already a year earlier

A GREAT SCANDAL

Big Efforts to Hush the Matter Up--- The Truth Out At Last . . .

Erom exhaustive enquiries made during the last few months we find there have been a number of patients kept under conditions which to say the least of it, is a great scandal.

We trust our readers will bear with us for a moment. The facts of the matter are these, there have been some thousands of cases where horses have been suffering from distemper, coughs, colds, kidney troubles, contracted hoof, swellings, splints and enlargements of all kinds, and in some cases no attempt has been made to relieve their sufferings, their owners either being indifferent, or where they have thought at all about their animals have had recourse to cheap so-called remedies, of which there are unfortunately a few on the market, but which, while some may give a little relief temporarily, cannot from the nature of their ingredients give permanent relief or effect a cure.

It is high time in our opinion that something should be done to bring this state of things to an end, and with this in view we are about to take drastic action, to bring before every owner of horses that wonderful remedy known to all as "Dr. J. Woodbury's Horse Liniment,"

This remedy has been used for years throughout the Dominion during which time it has been used in hundreds of cases, comprising distemper, coughs, colds, kidney troubles, contracted hoof, swellings, splints and enlargements of all kinds, and in no case to our knowledge, has "Dr. J. Woodbury's Liniment" failed to first relieve and then to cure the above mentioned complaints.

Every owner of horses should, if they have not already got a bottle of this Liniment in their stable immediately procure one. It is the only guaranteed remedy we know of, and it is a cheap form of insurance, and it will be found, that, if used immediately any symptoms of any of the above diseases appear, to give immediate relief, and probably save tremendous expense, probably the life of the horse as well.

Dr. J. Woodbury's Horse Liniment is sold by Stores and Chemists throughout Canada, but should your Storekeeper be out of stock he will procure it for you, and if you should find any trouble in getting a bottle, don't delay for an instant in mailing 25 cents and a bottle will be immediately forwarded you.

ABSORBINE

TRADE MARK REG. U.S. PAT. OFF

Removes Bursal Enlargements, Thickened, Swollen Tissues, Curbs, Filled Tendons, Soreness from any Bruise or Strain: Stops Spavin Lameness. Allays pain. Does not Blister, remove the hair or lay up the horse. $2.00 a bottle, delivered. **Book 1 K free.**

ABSORBINE, JR., the antiseptic liniment for mankind. For Synovitis, Strains, Gouty or Rheumatic deposits, Swollen, Painful Varicose Veins. Will tell you more if you write. $1 and $2 per bottle at dealers or delivered. Manufactured only by W. F. YOUNG, P.D.F. 124 Lymans Bldg., Montreal, Can.

Their prime continues until they are nine, as regards their innate working powers and strength, assuming that they remain sound, and that they are not prematurely worn out by excessive severe work, as happens so commonly with horses used for town work, nor that they have been overtaxed in their youth. At nine years old a horse will, of course, have lost some of its erstwhile freshness of appearance, and its legs will, in all probability, show the effects of wear to a greater or lesser extent, so that it no longer looks at its best, despite being so, while its market value will also have depreciated, the last, broadly speaking, being highest when horses are from four to six years old. The four-year-old has the whole of its future before it, hence the high value of horses at this age in the market. After nine years old the working powers begin gradually to decline, though perhaps not very perceptibly so for a couple of years. Horses, however, vary widely in regard to the age up to which they will retain their usefulness for work fairly unimpaired, and some will last years longer than others, all according to their constitution and wearing capacity, while much in regard to this question also depends upon the nature of the work they are used for.

Fith Maritime Horse Show

The Maritime Horse Show, which will be held at Amherst, April 1st, 2nd and 3rd, promises to be one of the best shows ever held under the auspices of the management. The prize list is practically the same as that of last year. The prize lists are now ready for distribution and those desiring them should address F. L. Fuller, Truro, or any of the Directors of the Maritime Stock Breeders' Association.

Horses That Sell Well.

A breeder and grower of horses has these sensible suggestions in a letter to American Farming. He says:

Many farmers think that there is no money in raising horses. Yet there is constant demand in the markets at remunative prices for horses of a definite type. Last summer I had opportunity to talk with a farmer on this very point. He was near an excellent horse market, and on his farm he was producing an abundance of the finest horse feed. But the buyers did not want his horses. The trouble was that they were neither draft horses nor road horses; neither express horses nor coach horses. They were nondescripts, without the right form and weight for any particular purpose. This farmer had started with a number of fairly good mares, but had tried first one stallion and then another without any definite idea in mind as to breed. The natural results was that the colts showed a mixture of incongrous tendencies. All that could be said of them was that they were horses. The modern market will not buy nondescript horses. They must be horses of a different class—draft horses, roadsters, etc.—with the proper form, size and action to admit them to that class. By consulting horse buyers the farmer can easily learn what the market requirements are, and can breed horses that meet these requirements. Then it will be found that there is money in raising horses. But there is surely no use in producing a mongrel horse when no one wants it.

There are several ways in which horses may be improved by intelligent selection and breeding, such as the farmer adopts in securing a herd of cows noted for their milk yield or a flock of sheep to produce winter lambs. I once had occasion to observe a company of cavalry horses that had been selected for their rapid walking gait. These horses, without urging, would easily make five miles an hour on a walk. I had previously thought my saddle horse was a fast walker, but found that he had to be trotted at frequent intervals to keep up with the procession. This seemed to be an interesting point, and I accordingly timed several ordinary saddle horses. They made less than four mile per hour. Now these are lines of work in which a fast walking gait would add greatly to the value of a horse. The walking speed of a horse can be increased by breeding just as readily as the trotting or running speed. A fast walker is more in demand and is good for more purposes than a fast runner. Horses are just as susceptible to improvement by breeding as other animals are. It will therefore pay farmers who are fitted for this work to breed up a line of horses with a fast walk. Don't be content with present standards, but raise them.

PEERLESS - PERFECTION

The Fence That's Locked Together

The attacks and onslaughts of animals can't faze it. It's strong, yet springy. Manufactured from Open Hearth steel galvanized wire. When made by this process, impurities are burned out of the metal, removing one of the chief causes of rapid corrosion or rusting.

Read What Others Say

Gentlemen:—There is no fault to find with your fence. The fencing I put up 4 years ago is just as good as the day I put it up, showing no sign of rust, and giving good satisfaction. The Peerless stands the test better than any other make that I have seen. Yours truly, Spring Brook. JOHN MASON.

Gentlemen:—I have been in the fence business for ten years, and I find no fence like the Peerless, both for galvanizing and workmanship. I consider it equal, if not superior to any other make of fence on the market today. I have always found the Banwell-Hoxie Fence Co. people of their word. Yours respectfully, Glenburnie, Ont. MACK. LILLIS.

FREE-FARM ACCOUNT BOOK

Bickmore's Farm Account Book will be sent free to any farmer who will tell us who and where he is. This book is arranged to keep all accounts in simple form—more simple and certainly more practical than trying to remember them; shows what to charge against crop production; has a laborers' time record; and section for personal accounts. **64 pages, for ink or pencil.** Not a cheap affair. Its quality is in keeping with **BICKMORE'S** Gall Cure, a soothing, healing salve, the old-time reliable horse remedy. Horses are now too valuable and too high priced to take chances of losing their services. **Bickmore's** Gall Cure heals and cures **Harness and Saddle Galls; Rope Burn, Cuts, Scratches, Grease Heel, etc.** You don't have to lay the horse off. **Bickmore's cures while the horse works.** Great thing for sore teats in cows. The work-horse trade mark on every box. None genuine without it. Be sure to ask for **Bickmore's** Gall Cure when you go to buy and do not take a substitute. Farm Account Book is ready. Send today.

WINGATE CHEMICAL CO., Canadian Distr's, 8100 Notre Dame St. W., Montreal, Can.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. adies, this department is yours. Use it to the best advantage.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

I felt the utmost sympathy for Mr. and Mrs. Micawber in this anxious extremity, and said as much to Mr. Micawber, who now returned: adding that I only wished I had money enough to lend them the amount they needed. Mr. Micawber's answer expressed the disturbance of his mind. He said, shaking hands with me, "Copperfield you are a true friend; but when the worst comes to the worst, no man is without a friend who is possessed of shaving materials." At this dreadful hint Mrs. Micawber threw her arms round Mr. Micawber's neck and entreated him to be calm. He wept; but so far recovered, almost immediately, as to ring the bell for the waiter, and bespeak a hot kidney pudding and a plate of shrimps for breakfast in the morning.

When I took my leave of them, they both pressed me so much to come and dine before they went away that I could not refuse. But, as I knew I could not come next day, when I should have a good deal to prepare in the evening, Mr. Micawber arranged that he would call at Doctor Strong's in the course of the morning (having a presentiment that the remittance would arrive by that post), and propose the day after, it would suit me better. Accordingly I was called out of school next forenoon, and found Mr. Micawber in the parlor; who had called to say that the dinner would take place as proposed. When I asked him if the remittance had come, he pressed my hand and departed.

As I was looking out of the window, that same evening, it surprised me, and made me rather uneasy, to see Mr. Micawber and Uriah Heep walk past, arm in arm: Uriah humbly sensible of the honor that was done him. and Mr. Micawber taking a bland delight in extending his patronage to Uriah. But I was still more surprised, when I went to the little hotel next day at the appointed dinner-hour, which was four o'clock, to find, from what Mr. Micawber said, that he had gone home with Uriah, and had drunk brandy-and-water at Mrs. Heep's.

"And I'll tell you what, my dear Copperfield," said Mr. Micawber, "your friend Heep is a young fellow who might be attorney-general. If I had known that young man, at the period when my difficulties came to a crisis, all I can say is, that I believe my creditors would have been a great deal better managed than they were."

I hardly understood how this could have been, seeing that Mr. Micawber paid them nothing at all as it was; but I did not like to ask. Neither did I like to say tnat I hoped he had not been too communitive to Uriah; nor to inquire if they had talked much about me. I was afraid of hurting Mr. Micawber's feelings, or, at all events, Mrs. Micawber's, she being very sensitive; but I was uncomfortable about it, too, and often thought about it afterwards.

We had a beautiful little dinner. Quite an elegant dish of fish; the kidney end of a loin of veal, roasted; fried sausage-meat; a partridge and a pudding. There was wine, and there was strong ale; and after dinner Mrs. Micawber made us a bowl of hot punch with her own hands.

Mr. Micawber was uncommonly convivial. I never saw him such good company. He made his face shine with the punch, so that it looked as if it had been varnished all over. He got cheerfully sentimental about the town, and proposed success to it: observing that Mrs. Micawber and himself had been made extremely snug and comfortable there, and that he never should forget the agreeable hours they had passed in Canterbury He proposed me afterwards; and he, and Mrs. Micawber, and I, took a review of our past acquaintance, in the course of which, we sold the property all over again. Then I proposed Mrs. Micawber; or, at least, said modestly. "If you'll allow me, Mrs. Micawber, I shall now have the pleasure of drinking your health, ma'am." On which Mr. Micawber delivered an eulogium on Mrs. Micawber's character, and said she had ever been his guide, philosopher, and friend, and that he would recommend me, when I came to a marrying time of life, to marry such another woman, if such another woman could be found.

As the punch disappeared, Mr. Micawber became still more friendly and convivial. Mrs. Micawber's spirits becoming elevated, too, we sang "Auld Lang Syne." When we came to "Here's a hand, my trusty frere," we all joined hands round the table; and when we declared we would take a right gude Willie Waught," and hadn't the least idea what it meant, we were really affected.

In a word, I never saw anybody so thoroughly jovial as Mr. Micawber was, down to the very last moment of the evening, when I took a hearty farewell of himself and his amiable wife. Consequently, I was not prepared, at seven o'clock next morning, to receive the following communication, dated half-past nine in the evening; a quarter of an hour after I had left him:—

"My dear young friend,

"The die is cast—all is over. Hiding the ravages of care with a sickly mask of mirth, I have not informed you, this evening, that there is no hope of the remittance! Under these circumstances, alike humiliating to endure, humiliating to contemplate, humiliating to relate, I have discharged the pecuniary liability contracted at this establishment, by giving a note of hand, made payable fourteen days after date, at my residence, Pentonville, London. When it becomes due, it will not be taken up. The result is destruction. The bolt is impending, and the tree must fall.

"Let the wretched man who now addresses you, my dear Copperfield, be a beacon to you through life. He writes with that intention, and in that hope. If he could think himself of so much use, one gleam of day might, by possibility, penetrate into the cheerless dungeons of his remaining existence—though his longevity is, at present, to say the least of it, extremely problematical.

"This is the last communication, my dear Copperfield, you will ever receive

"From the beggared outcast,

WILKINS MICAWBER."

I was so shocked by the contents of this heartrending letter, that I ran off directly towards the little hotel with the intention of taking it on my way to Dr. Strong's and trying to soothe Mr. Micawber with a word of comfort. But, half way there, I met the London coach with Mr. and Mrs. Micawber up behind; Mr. Micawber the very picture of tranquil enjoyment, smiling at Mrs. Micawber's conversatian, eating walnuts out of a paper bag, with a bottle sticking out of his breast pocket. As they did not see me, I thought it best, all things considered, not to see them. So, with a great weight taken off my mind, I turned into a by-street that was the nearest way to school, and felt, upon the whole, relieved that they were gone: though I still liked them very much, nevertheless.

CHAPTER XVIII.

A Retrospect.

My school-days! The silent gliding out of my existence—the unseen, unfelt progress of my life—from childhood up to youth! Let me think, as I look back upon that flowing water, now a dry channel overgrown with leaves, whether there are any marks along its course, by which I can remember how it ran.

A moment, and I occupy my place in the Cathedral, where we all went together, every Sunday morning, assembling first at school for that purpose. The earthy smell, the sunless air, the sensation of the world being shut out, the resounding of the organ through the black and white arched galleries and aisles, are wings that take me back, and hold me hovering above those days, in a half-sleeping and half-waking dream.

I am not the last boy in the schooll I have risen in a few months over several heads. But the first boy seems to me a mighty creature, dwelling afar off, whose body height is unattainable. Agnes says "No," but I say "Yes," and tell her that she little thinks what stores of knowledge have been mastered by the wonderful Being, at whose place she thinks I, even I, weak aspirant, may arrive in time. He is not my private friend and public patron, as Steerforth was; but I hold him in a reverential aspect. I chiefly wonder what he'll be, when he leaves Dr. Strong's and what mankind will do to maintain any place against him.

But who is this that breaks upon me! This is Miss Shepherd, whom I love.

Miss Shepherd is a boarder at the Misses Nettingall's establishment. I adore Miss Shepherd. She is a little girl, in a spencer, with a round face and curly flaxen hair. The Misses Nettingalls' young ladies come to the Cathedral too. I cannot look upon my book, for I must look upon Miss Shepherd. When the choiresters chaunt, I hear Miss Shepherd. In the service I mentally insert Miss Shepherd's name I put her in among the Royal family. At home, in my own room, I am sometimes moved to cry out, "Oh, Miss Shepherd!" in a transport of love.

For some time, I am doubtful of Miss Shepherd's feelings, but, at length, Fate being propitious, we meet at the dancing school. I have Miss Shepherd for my partner. I touch Miss Shepherd's glove, and feel a thrill go up the right arm of my jacket, and come out at my hair. I say nothing tender to Miss Shepherd but we understand each other. Miss Shepherd and myself live but to be united.

Why do I secretly give Miss Shepherd twelve Brazil nuts for a present I wonder? They are not expressive of affection, they are difficult to pack into a parcel of any regular shape, they are hard to crack, even in room doors, and they are oily when cracked; yet I feel they are appropriate to Miss Shepherd. Soft, seedy biscuits, also, I bestow upon Miss Shepherd; and oranges innumerable. Once, I kiss Miss Shepherd in the cloak room. Ecstasy! What are my agony and indignation next day, when I hear a flying rumor that the Misses Nettingall have stood Miss Shepherd in the stocks for turning in her toes.

Miss Shepherd being the one pervading theme and vision of my life, how do I ever come to break with her? I can't conceive. And yet a coolness grows between Miss Shepherd and myself. Whispers reach me of Miss Shepherd having said she wished I wouldn't stare so, and having vowed a preference for Master Jones—for Jones! a boy of no merit whatever! The gulf between me and Miss Shepherd widens. At last, one day, I met the Misses Nettingalls' establishment out walking. Miss Shepherd makes a face as she goes

Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

WOMAN IN TERRIBLE STATE

Finds Help in Lydia E. Pinkham's Vegetable Compound.

Cape Wolfe, Canada.—"Last March I was a complete wreck. I had given up all hope of getting better or living any length of time, as I was such a sufferer from female troubles. But I took Lydia E. Pinkham's Vegetable Compound, and today I am in good health and have a pair of twin boys two months old and growing finely. I surprised doctors and neighbors for they all know what a wreck I was.

"Now I am healthy, happy and hearty, and owe it all to Lydia E. Pinkham's remedies. You may publish this letter if you like. I think if more women used your remedies they would have better health."—Mrs. J. T. Cook, Lot No. 7, Cape Wolfe, P.E.I., Canada.

Because your case is a difficult one, and doctors having done you no good, do not continue to suffer without giving Lydia E. Pinkham's Vegetable Compound a trial. It surely has remedied many cases of female ills, such as inflammation, ulceration, displacements, tumors, irregularities, periodic pains, backache, and it may be exactly what you need.

The Pinkham record is a proud and peerless one. It is a record of constant victory over the obstinate ills of women—ills that deal out despair. It is an established fact that Lydia E. Pinkham's Vegetable Compound has restored health to thousands of such suffering women. Why don't you try it if you need such a medicine?

JUST THE COLLAR FOR THOSE WHO WORK

The CHALLENGE BRAND WATERPROOF COLLARS

No shiny celluloid or hard rubber about "Challenge" Waterproof Collars.

Look like linen—feel like linen—give you the smart, neat appearance of a brand new linen collar.

But are much better for you than linen.

Sold everywhere at 50c. per bottle, $5.50 per dozen.

by, and laughs to her companion. All is over. The devotion of a life—it seems a life, it is all the same—is at an end; Miss Shepherd comes out of the morning service, and the Royal family know her no more.

I am higher in the school, and no one breaks my peace. I am not at all polite, now, to the Misses Nettingalls' young ladies, and shouldn't dote on any of them, if they were twice as many and twenty times as beautiful. I think the dancing-school a tiresome affair, and wonder why the girls can't dance by themselves and leave us alone. I am growing great in Latin verses, and neglect the laces of my boots. Doctor Strong refers to me in public as a promising young scholar. Mr. Dick is wild with joy, and my aunt remits me a guinea by the next post.

The shade of a young butcher arises like the apparit on of an armed head in Macbeth. Who is this young butcher? He is the terror of the youth of Canterbury. There is a vague belief abroad, that the beef suet with which he anoints his hair gives him unnatural strength, and that he is a match for a man. He is a broad-faced bull-necked young butcher, with rough red cheeks, and ill-conditioned mind, and an injurious tongue. His main use of this tongue, is, to disparage Dr. Strong's young gentlemen. He says, publicly, that if they want anything he'll give it 'em. He names individuals among them (myself included), whom he could undertake to settle with one hand, and the other tied behind him. He waylays the smaller boys to punch their unprotected heads, and calls challenges after me in the open street. For these sufficient reasons I resolve to fight the butcher.

It is a summer evening, down in a green hollow, at the corner of a wall. I meet the butcher by appointment. I am attended by a select body of our boys; the butcher, by two other butchers, a young publican, and a sweep. The preliminaries are adjusted, and the butcher and myself stand face to face. In a moment the butcher lights ten thousand candles out of my left eyebrow. In another moment, I don't know where the wall is, or where I am, or where anybody is. I hardly know which is myself and which is the butcher, we are always in such a tangle and tustle, knocking about upon the trodden grass. Sometimes I see the butcher, bloody but confident; sometimes I see nothing, and sit gasping at my second's knee; sometimes I go in at the butcher madly, and cut my knuckles open against his face, without appearing to discompose him at all. At last I awake, very queer about the head, as from a giddy sleep, anh see the butcher walking off, congratulated by the two other butchers and the sweep and the publican, and putting on his coat as he goes; from which I augur, justly, that the victory is his.

I am taken home in a sad plight, and I have beef-steaks put to my eyes, and am rubbed with vinegar and brandy, and find a great white puffy place bursting out on my upper lip, which swells immoderately. For three or four days I remain at home, a very ill looking object, with a green shade over my eyes; and I should be very dull, but that Agnes is a sister to me, and condoles with me, and reads to me, and makes the time light and happy. Agnes has my confidence completely, always; I tell her all about the butcher, and the wrongs he has heaped upon me; she thinks I couldn't have done otherwise than fight the butcher, while she shrinks and trembles at my having fought him.

Time has stolen on unobserved, for Adams is not the head boy in the days that are come now, nor has he been this many and many a day. Adams has left the school so long, that when he comes back, on a visit to Doctor Strong, there are not many there, besides myself, who know him. Adams is going to be called to the bar almost directly, and is to be an advocate, and to wear a wig. I am surprised to find him a meeker man than I had thought, and less imposing in appearance. He has not staggered the world yet, either: for it goes on (as well as I can make out) pretty much the same as if he had never joined it.

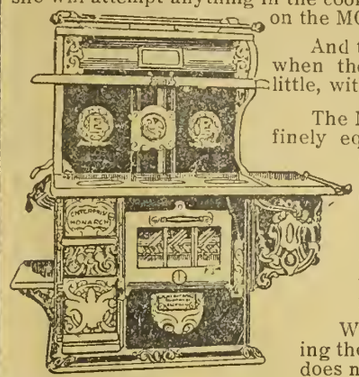
A blank, through which the warriors of poetry and history march on in stately hosts that seem to have no end—and what comes next! I am the head boy, now! I look down on the line of boys below me, with a condescending interest in such of them as bring to my mind the boy I was myself, when I first came there. That little fellow seems to be no part of me; I remember him as something left behind on the road of life —as something I have passed, rather than have actually been—and almost think of him as of some one else.

And tne little girl I saw on the

"THE ENTERPRISE MONARCH"

CANADA'S FINEST STEEL RANGE

inspires the housekeeper with a feeling of confidence and security. With it she will attempt anything in the cooking line, for she knows she can depend on the MONARCH to respond to her needs.



And this in warm weather or extreme cold, when there is much baking to be done or very little, with consequent fuel economy.

The MONARCH is so easily controlled, so finely equipped and so thoroughly constructed, that it answers every need of a first-class, up-to-date range that will burn coal or wood and give plenty of hot water.

The cost is moderate, considering the type of the range and the years of service it will give with a minimun expense for repairs.

Write for our illustrated circular, explaining the MONARCH in detail, if your dealer does not handle this range:

Full Address.....

.....

*If you only want overcoat patterns, cross out the word "suit." If you only want suitings, cross out "overcoat."
Maritime Farmer, Coupon No. 1

We Want Every Reader of the Maritime Farmer to Sign and Mail This Coupon

Mail it and get a free set of Catesby's suit or overcoat patterns and be convinced that it is possible to buy a better suit in London, England, for $12.50 than could be bought in Canada for $25.00.

You've heard that clothing is much cheaper and better in England—you know that English fabrics are the finest in the world.

Think, then, of the advantage of securing a suit made of the best English woolens, cut in the latest Canadian, New York or London style (whichever you prefer), and tailored to your individual measure, delivered to your door all duty and carriage charges prepaid, for about half what you would have to pay if you bought it in Canada?

Isn't it worth while then to get our patterns and see what there is in this offer? You can't lose anything by it but you may save a whole lot.

All you need to do is to fill in the coupon and mail it to our Toronto office. By return we'll send our latest Style Book, 72 pattern pieces of fine English suitings, a letter explaining our system of doing business, and a self-measurement chart that is so simple you can't go wrong in taking your own measure.

We will also send you testsmonials from Canadians who at first were as sceptical as you are, but who are now satisfied and regular patrons.

Write now. If you don't want to cut this paper, send a post-card or letter. We'll mail the book and patterns anyway. But to get them **you must mention** Sussex Maritime Farmer.

Minard's Liniment Co., Limited.

Gentlemen,—My daughter, 13 years old, was thrown from a sleigh and injured her elbow so badly it remaineh stiff and very painful for three years. Four bottles of MINARD'S LINIMENT completely cured her and she has not been troubled for two years.

Yours truly,

J. B. LIVESQUE

St. Joseph, P. O., 18th Aug., 1900.

first day at Mr. Wickfield's, where is she? Gooe also. In her stead, the perfect likeness of the picture, a child likeness no more, moves about the house; and Agnes, my sweet sister, as I call her in my thoughts, my counsellor and friend, the better angel of the lives of all who come within her calm, good, self-denying influence, is quite a woman.

What other changes have come upon me, besides the changes in my growth and looks, and in the knowledge I have garnered all this while? I wear a good watch and chain, a ring upon my little finger, and a long-tailed coat; and I use a great deal of bear's grease—which, taken in conjunction with the ring, looks bad. Am I in love again? I am. I worship the eldest Miss Larkins.

The eldest Miss Larkins is not a little girl. She is a tall, dark, black eyed, fine figure of a woman. The eldest Miss Larkins is not a chicken; for the youngest Miss Larkins is not that, and the eldest must be three or four years older. Perhaps the eldest Miss Larkins may be about thirty. My passion for her is beyond all bounds.

The eldest Miss Larkins knows officers. It is an awful thing to bear. I see them speaking to her in the street. I see them cross the way to meet her, when her bonnet (she has a bright taste in bonnets) is seen coming down the pavement, accompanied by her sister's bonnet. She laughs and talks, and seems to like it. I spend a good deal of my own spare time in walking up and down to meet her. If I can bow to her once in the day (I know how to bow now, knowing Mr. Larkins), I am happier. I deserve a bow now and then. The raging agonies I suffer on the night of the Race Ball, where I know the eldest Miss Larkins will be dancing with the military, ought to have some compensation, if there be even-handed justice in the world.

(Continued in next issue)

Farm Home Food.

French Beef Steak—Have ready a tender steak weighing about 1 pound, trim it neatly, and cut off all the fat Wash and prepare one carrot and a small turnip, and cut them into slices, slice half of a medium-sized onion, and cut three or four sticks from a head of celery into small pieces cross-wise. Put 2 oz. of butter into a stewpan, and when hot add the vegetables and fry them brown; then put in the steak and brown it well both sides. Pour in half a pint of hot water, add a bunch of herbs, and let all simmer together for an hour and a half, stirring occasionally to prevent the contents of the pan sticking to the bottom and getting burnt. Meanwhile have more carrot, turnip, onion and celery boiled in salted water until tender, and bake the trimmings of fat cut from the steak in the oven until brown. When done put the steak on a hot dish, strain the gravy round, arrange the fat on the top, and little heaps of the boiled vegetables round the edge of the dish and serve very hot.

Orange Gingerbread—Ingredients: ½ lb. of flour, half-teaspoonful of good baking powder, 4 oz. of butter, 4 oz. of golden syrup, 2 oz. of brown sugar one teaspoonful of ground ginger, 1 egg, the grated rind and strained juice of one large orange, 1 oz. of candied orange peel cut into small dice. Mix well together the flour, baking powder, ginger, grated orange rind, and candied peel. Put the syrup butter and sugar into a saucepan and warm them over a mild heat until well mixed; add the beaten egg and the orange juice, and stir these to the dry ingredients. Pour into a buttered Yorkshire pudding tin that has been lined with buttered paper, and bake in a moderate oven for about forty minutes.

The Rea' Irish Stew—A "Subscriber" would like us to repeat the receipe for a "Real Irish Stew," which he did not see when it appeared in a previous issue. We have great pleasute in acceding to his request:— The method adopted around here is as follows: In the first place, all the ingredients must be added to the stewpan in their raw state, as the real meaning of stew is a combination of flavors, blended together to suit the palate. What distinguishes the Irish stew from Seville, Exter, or any other stew is the predominating flavor of the potato, the stape food of Ireland since the days of Sir Walter Raleigh. If all is not cooked together the flavor of one ingredient cannot be imparted to the others. As to onions used here, we grow what

Flour trial is essential but—it is not your work!

Flour varies from time to time in baking quality. This is because wheat continually varies according to soil conditions, etc.

Therefore, if baking results are to be constantly high, baking tests are essential. It is unreasonable to expect you to make these tests at your expense.

PURITY

So from each shipment of wheat delivered at our mills we take a ten pound sample. This is ground into flour. Bread is baked from the flour. If this bread is high in quality and large in quantity, we use the shipment. Otherwise we sell it.

By simply asking for **FLOUR** bearing this name you can always be sure of more bread and better bread.

"More Bread and Better Bread" and "Better Pastry Too" 523

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience**, we know better than any doctor; and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment. If you suffer from **pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid**, to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured**, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—**young or old.** To **Mothers of Daughters**, I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask** for the **free treatment to-day**, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309, WINDSOR, ONTARIO

are known as "potato" onions. These are what ought to be used if procurable at all, for this particular stew, as they are not nearly so strong in flavor as Spanish onions and the meat used must be rather lean, as greasy stew is abominable. Then slow cooking, so much so, that the potatoes retain their shape when cooked. Irish stew, when properly made, is really an appetising dish, not something between a "hash" and a "stew."

Color in the Home.

Every housekeeper's library may well include Principles of Home Decoration by Candace Wheeler, which is a concise and complete authority. From it the following notes are taken

The general appearance of the interior of a house is very largely the result of the color treatment and the careful selection of accessories. The color of the walls dictates that for all else in the room, and creates the atmosphere, whether cheerful or sad cozy or repellant.

The relation of color to the beauty of the house has just recently been recognized, and beauty within the house may in a degree atone for the loss of nature's beauty. The color used in a room depends on (1) quality and quantity of light and (2) personal taste. A north room or one much shaded requires a warm treatment with yellow, red, or golden brown. South rooms are best treated with cool blues, water greens, grays, or greenish yellows. A limited amount of the warmer colors may sometimes be used here also, and no room should be without a touch of red. Personal preference should receive greater consideration than it usually does. It is not always necessary to know why a color is disliked, if it has an unpleasant effect, it should be discarded.

A material chosen in a strong light appears many shades darker in large wall masses or dark colors. Walls should seldom be more than moderately dark in color. The subject should be studied in all its phases.

Useful Hints.

Pour a strong and hot solution of soda water down the gutter gullies, and small sink traps occasionally; it keeps them sweet and clean. This is absolutely necessary for the kitchen and wash-house sinks.

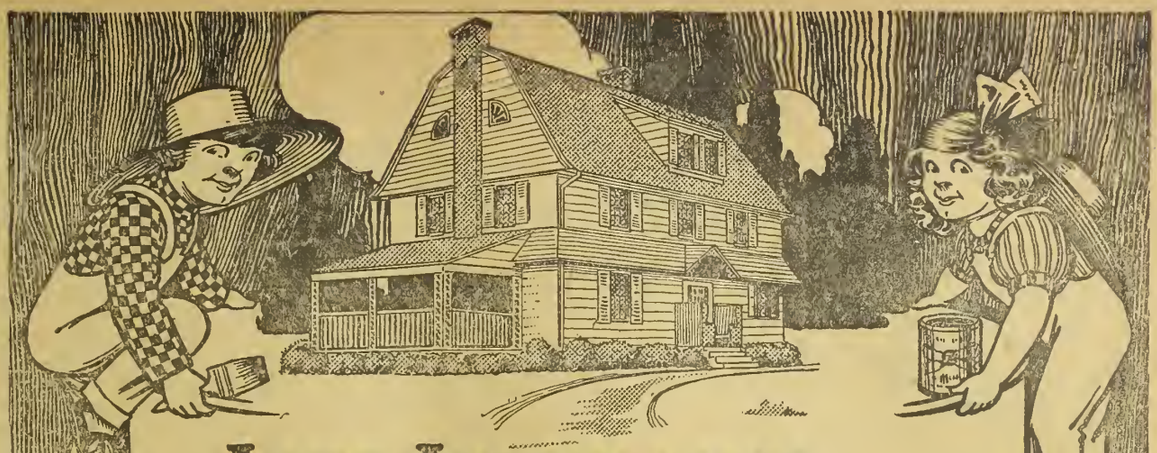
A cut lemon will often remove even obstinate stains, but strong spirits should on no account be used for removing them or grease spots.

Very badly stained and furred decanters can be quickly cleaned if half-filled with stale tea-leaves with the addition of a little vinegar. Shake vigorously, turn out the liquid and rinse. If the decanter is not quite clean repeat the operation. The final rinsing should be of cold water, turning the neck safely downward to drain and so dry.

To fill nail-head holes in wood mix a little sawdust of the same kind of wood with a little glue. Press this well into the hole or fracture, when well hardened it can be fined down with a piece of glass-paper, the repair being hardly noticeable and quite obliterated if the article is to be repolished or painted.

Even though a carpet may be underlaid with felt it is a good plan to place a few sheets of old newspaper between as the printing ink is a capital moth preventative.

Paper bags got at the fruiterer's or grocer's are usefuf for covering the hands when blackfeading a stove. They prevent hand soiling and can be put on the fire when done with, a much better plan than keeping gloves about the place.



LIFE INSURANCE FOR YOUR HOUSE

A TREE often lives several hundred years. Nature has protected the wood by covering it with bark to shield it from the elements.

When trees are sawed into lumber, Nature's protection is lost. Therefore, the wood used in your house must be paint protected to insure it against wear and weather.

"100% Pure" Paint is a good life insurance policy on your house. It protects against decay—pays for itself, over and over again, in the repairs it saves—adds value and beauty to the building as well as long life to the wood.

Martin-Senour "100% Pure" Paint

is most satisfactory for all outside and inside painting. ***"100% Pure"*** is genuine White Lead, Oxide of Zinc, purest Colors, and Linseed Oil—ground to extreme fineness by powerful machinery—the combination of which produces a paint that is greatest in hiding, covering and wearing qualities—and makes it the cheapest to use as well as the most satisfactory.

Write for our booklet, "Town and Country Homes". It gives you many helpful suggestions in Color Harmonies, and is free for the asking.

MARTIN-SENOUR 100% PURE PAINT & VARNISHES

The Martin-Senour Co.

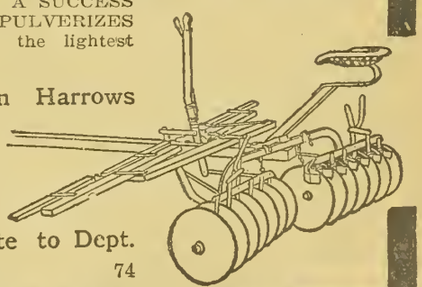
Prove the "BISSELL" by Its Work

Do the gangs on your Harrow crowd together and raise out of the ground if it is hard? They won't do this on the "Bissell." The "Bissell" is so designed that THE GANGS CAN'T CROWD OR BUMP together no matter how hard the ground may be.

Tough soil won't stick the "Bissell." It stays right down to its work and pulverizes the ground thoroughly.

We ask you to take a "Bissell" out into the field and test it beside other Harrows. Then you will HAVE PROOF that it is A SUCCESS ON HARD LAND—THAT IT PULVERIZES THE BEST—and that it is the lightest draught.



Post yourself fully on Harrows before buying. We put our name on every Harrow so that you will know it is genuine. Ask your local dealer, or write to Dept. M for free Catalogue. 74

Simple Cold Cures.

With the first indication of a cold all work should be suspended and treatment of the affection made the chief business. A hot bath of some kind should be taken, a simple foot bath often being effective. Place the feet in a small tub or bucket two-thirds full. The receptacle should be covered over with blankets or other material in order to retain as much of the heat as possible. The water should be as hot as can be borne, and as it cools may be reheated by the addition of fresh water at intervals. The patient should sip water or lemonade as hot as can be borne during the course of the treatment. The bath should continue until a good perspiration is secured. The feet should then be wiped dry and the patient undressed and put to bed with enough covering to insure warmth and to prevent chilling. In many cases where sneezing is the chief symptom, relief can be obtained by inhaling steam to which have been added 20 to 30 drops of camphor. For this purpose a bath towel and a small bowl filled with boiling water may be used. Arrange the towel so that it encloses the bowl and the head of the patient. Apply the treatment for ten minutes every two hours, after each treatment rubbing the face with a towel wrung out of cold or ice water. This simple remedy influences not only the inflamed mucous lining of nasal passages and throat, but also affects those parts of the skin area which have a direct nerve connection with the affected parts. An important feature of the treatment of colds consists in the hygiene of the alimentary canal. Particular care should be taken that the bowels are moved before any of the above sweating procedures are employed. The chief reliance should be placed upon a laxative diet. Water, which flushes the system and thus removes accumulated poisons, and which also exerts a laxative effect, should be drunk in large quantities. Aside from this, fruits and fruit juices may be used freely—in fact, they may be used exclusively for the first two or three days to advantage. Generally the appetite is in abeyance, so that fruit may be taken as freely as may be desired, especially such juicy frdits as apples, peaches, pears, oranges, and grapes. Cereal and vegetable foods may be added gradually until the cure is complete.

Infant Mortality.

It cannot be too strongly impressed upon mothers that by all means the safest food for babies is that which nature provides— the mother's milk. James Acton, of Toronto, discussing this question for the Women's Institutes of Ontario, has said·

"It is estimated that in the United States there are about 225,000 children die before the age of five years. In this country, I have not seen any figures, but I think it is a safe estimate that somewhere between 20,00 and 25,000 children die every year before they reach the age of five. It is claimed by eminent authorities that at least one-half of these deaths could be avoided. In other words, we have to face the fact that within the Dominion of Canada there passes away every year, of children under the age of five, somewhere in the neighborhood of 12,000 which could actually be saved. A doctor says that of 2,000 children who died, when he looked at the history of these cases, he found that four-fifths of them died from imperfect feeding, causing troubles of the intcstines and stomach. Another authority states that out of 943 cases, nearly 90 per cent of them died from imperfect nourishment, from bad feeding. In the city of Bir-

Make Your Stock and Poultry Pay Better with
Royal Purple
STOCK AND POULTRY SPECIFICS

At a cost of less than a cent a day per head of stock, it will increase their value 25 per cent. Permanently cures Colic, Debility, Worms, Bots and Skin Diseases. Tones up run-down animals so that they quickly gain weight and vigor. Increases the yield of milch cows three to five pounds a day, besides enriching the quality of the milk.

ROYAL PURPLE is not a food. It is a conditioner—the best ever so'd. If there was any better we would be making it. It enables your stock to eat the natural food they should eat and get the most benefit from it. Here is the advice of all thorough veterinary doctors—"Feed your stock on food of your own growing"—not pamper them with soft predigested mush so that after a time they cannot digest good, wholesome feed. Feed the good food grown on your own farm—hay, oats, bran, chop, etc. You know what these things cost you and what they will do.

ROYAL PURPLE is an aid to these natural foods and if you use it as directed, we can guarantee better results than if you feed any of the concoctions offered on the market as "prepared foods."

Try It On a Poor-Conditioned Animal

If there is a run-down, poorly nourished beast on your farm, see what **ROYAL PURPLE SPECIFIC** will do for it. A 50-cent package lasts a cow or horse 70 days. The cost is so trifling that no farmer in Canada has any excuse for having out-of-health stock around his place. Try it on the poorest-conditioned animal you have and we know you'll be surprised at the result of a short treatment. Cattle and hogs fatten up a month earlier than without it, which means you save a month's feed and a month's labor. You can bring six pigs to the pink of condition at the cost of $1.50. Steers treated in the same way cost no more than $1.00 each to put in prime state for market. **ROYAL PURPLE SPECIFIC** fattens and keeps well horses, mares, colts, cows, calves, steers, hogs. Sold in packages, 50c, and air-tight tins, $1.50.

Try ROYAL PURPLE POULTRY SPECIFIC on Your Hens

Do you know that **ROYAL PURPLE POULTRY SPECIFIC** makes hens lay in winter as well as in summer, and keeps them free from disease? It does, and helps them over the moult, fattens and keeps them in vigorous health. A 50c package lasts 25 hens over 70 days. Shouldn't you try it? We have hundreds of recommendations from all parts of the country. If **ROYAL PURPLE** does not give you better results than anything you ever used, or give you satisfaction, we will refund your money. No matter what your opinion of other preparations, we want you to give **ROYAL PURPLE POULTRY SPECIFIC** a chance to show what it can do for your poultry—and a 50c package will show you some fine results. Sold in 25c and 50c packages and $1.50 air-tight tins.

WE ALSO SELL

Royal Purple Cough Specific for cough and distemper. (Will cure any ordinary cough in four days). 50c, by mail 60c.

Royal Purple Sweat Liniment for lameness, rheumatism, sprained tendons, etc. 50c, by mail 60c.

Royal Purple Worm Specific for animals; removes the worms, also their larvae. 25c, by mail 30c.

Royal Purple Disinfectant, in 25c, 50c and $1.00 tins.

Royal Purple Lice Killer for poultry and animals. 25c and 50c, by mail 30c and 60c.

Royal Purple Gall Cure for scratches, harness scalds, open sores, etc. 25c and 50c, by mail 30c and 60c.

Royal Purple Roup Specific for roup, pip, diphtheria, typhoid fever, canker, white diarrhoea, swelled head, etc., in poultry. 25c, by mail 30c.

Free
TO STOCK AND POULTRY RAISERS

We will mail for the asking our new revised 80-page book on common ailments of stock and poultry. Tells how to feed light and heavy horses, colts, mares, cows, calves, steers, hogs; also how to feed and keep poultry so that they lay winter and summer. Cover lithographed in six colors, showing farm utility birds in their natural colors. This is a book that should be in every farmer's possession. IT'S FREE. Write for your copy today.

ROGERS FUR COMPANY,
Dept. 332 St. Louis, Mo.

Children are much more likely to contract the contagious diseases when they have colds. Whooping cough, diptheria, scarlet fever and consumption are diseases that are often contracted when the child has a cold. That is why all medical authorities say beware of colds. For the quick cure of colds you will find nothing better than Chamberlain's Cough Remedy. It can always be depended upon and is pleasant and safe to take. For sale by all dealers.

mingham, the health office in 1905 made a report that out of 178 cases, 133 were of children who died from imperfect feeding. This subject of 10,000 preventable deaths of children ought to interest every woman. Now the first thing that we need to lay down in this propaganda of life saving for children, is that the safest food for children is the mother's breast. One of the stastics that I have here states that only three per cent of the number of deaths could be traced to mothers who had nursed their own children. It is a wonderful provision of Providence; it is found in cattle as well as human kind, that the milk that comes from the mother is practically pure. The mother may be diseased. Why, where mothers are affected with contagious diseases, the doctor seldom thinks of taking the child away from the mother. The mother will not transfer disease to the child while she is nursing it. It is a provision of nature tbat the milk reaches the child in a pure uncontaminated form. The first thing we need to emphasize is that the safety of the child depends on being fed as much as possible by the mother."

Killing Diphtheria Germs.

Diphtheria is caused by the presence in the throat of a germ called Klebs Loeffler bacillus. It is different from many other disease germs in that the germ does not enter the blood, but remains localized in the throat, and produces toxins which are taken by the blood to all parts of the body.

After any infectious disease, the sick room should be disinfected. The best material to use for this purpose is formalin, which on evaporation gives off formaldehyde gas which kills any germs that are adhering to the walls, furnishings, bedding, etc. Use 10 or 12 ounces of formalin for every 1,000 cubic feet of air space in the room. Stop up all cracks in the room, close all chimneys, stovepipe holes, windows, etc., all openings of any kind must be closed. Make the room as nearly air-tight as possible, so that the gas cannot escape before killing the germs. Fasten up a line across the room to which a sheet can be attached. Open the bureau drawers and leave everything in situ. Mix the formalin with three times its bulk of water, throw it on the sheet with a dipper, then leave the room closed for twenty-four hours. At the end of that time all disease germs will be killed. Then open the room and air it. It will not be fit for a sleeping room for three or four days.

An Evening of Fun.

A hard times party can be made to yield more fun to the minute than almost any other form of entertainment. It can be held in the barn, the basement or attic if they are warm enough, but the usual rooms will do especially if the nice furniture is removed and boxes substituted for the chairs, etc.

For invitations tear off (don't cut) a piece of manilla wrapping paper, and write the invitation upon it, or have them printed upon strawboard, mailed in manilla envelopes. All the guests should come in ragged clothes or if these are not obtainable, the girls should wear gingham aprons and the boys overalls. A patch here and there adds to the costume.

Refreshments should be served from wooden plates, tin spoons, paper cups etc.— no fine dishes are to be used. Spread the table cloth upon the floor, and O my, what fun! Sandwiches, cake, pickles, candy, coffee and chocolate are enough to serve, but have plenty, as at a party of this kind the people are less bashful about taking a second helping. Dolls made from clothespins and dressed as boys and girls make fine favors. The head of the pin can be mane into a face with a few strokes of the pen. If the place be large, dance square and circle dances and an accordion player is the best for the occasion.

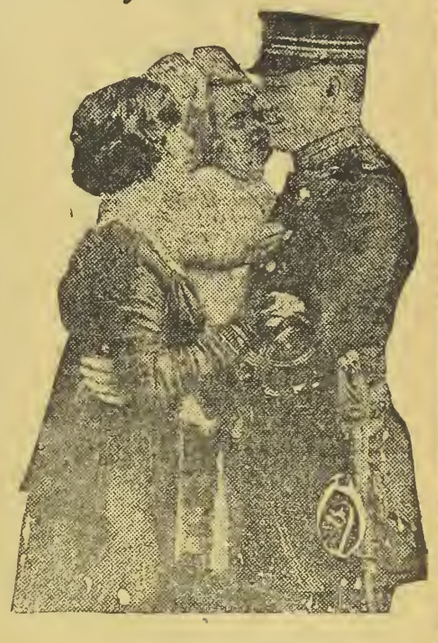
Special Advice For Men

Vitality Restored by New Method

The attached coupon entitles you to one illustrated copy of my pocket compendium and guide for the self-restoration of lost strength. (See description below) Upon hearing from you, this valuable little book of private information for men will be sent by return mail in plain sealed envelope. Please call or write today.

There is a new and marvelous method for restoring lost manly strength, for renewing the vigor of youth, which every man should know of, a self-restorer which operates without the use of drugs or medicines, a new way to treat yourself and by which it is my firm belief any man anywhere who is content to lead a decent life, free from excesses and dissipations may be almost certain to restore his full manly vigor snd strength, if he but makes the little effort that is called for in connection with the use of a little vitalizing appliance which I have patented and am now distributing all over the world.

Please remember that a man is not one day older than he actually feels, and therefore no matter what your age, if you are young or elderly, married or single, large or small, if I can show you reader, how you can yourself actually add to your system, nerves and blood the very nerve force or vital vigor which may have been drained away, and which is necessary to make you strong, vigorous, and capable again, then I have shown you the real secret of perpetual youth, and how you can again be filled with vitality and again be just as powerful in your influence and just as thoroughly manly in your capacity as the big gest fullest blooded, most successful fellow of your acquaintance.



HEALTH IS HAPPINESS

I call my vitalizer a HEALTH BELT because it is worn around your body in the position of an ordinary belt. It sends a great, soft, strength-giving supply of a force I call vitality into your body nights while you sleep. I would like you to call or to write and get my free book, that you may know the whole wonderful account of what my HEALTH BELT is doing for others who were looking for a safe and sure means to restore vigorous health and to rid the body of pains, aches and weaknesses.

Note—My HEALTH BELT, with special attachment, is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, etc.

86-PAGE BOOK SENT FREE

My 86- page illustrated booklet (pocket size) was compiled by me to answer fully and correctly those questions which are asked privately by any man needing new strength and who seeks personal advice pertaining to the ailments and weaknesses he wishes to overcome. The book, fully illustrated, with photo reproductions contains much that a single or married man should know. It also fully describes my HEALTH BELT and tells how you may secure one to use in your own case, should you decide you want to use one. Remember the book is sent absolutely free, in plain, sealed envelope. Why not write for a copy today?

DR. M. F. SANDEN,
140 Yonge St., Toronto, Ont.

Dear Sirs—Please forward me your book as advertised, free.

NAME.....

ADDRESS.....

Many sufferers from rheumatism have been surprised and delighted with the prompt relief afforded by applying Chamberlain's Liniment. Not one case of rheumatism in ten requires any internal treatment whatever. This liniment is for sale by all dealers.

To prevent accidents at the time of lighting the kitchen fire, fill the coal oil can with water. We have never known of a serious burning accident to follow such a course, but pouring coal oil on fires results in disaster right along.

Keep the "emergency shelf" well-filled so that unexpected company will not find you unprepared. It is not necessary to give such visitors an especially elaborate meal but ease and comfort are much increased if one feels "prepared."

A Severe Cold

Settled On Her Lungs.

Mrs. Geo. Murphy, Spence, Ont., writes:—"I have had occasion to use Dr. Wood's Norway Pine Syrup, and can say it most certainly is a wonderful medicine. Last winter my little girl, just a year old, took a severe cold which settled on her lungs. I tried everything, and was almost in despair, when by chance I read of Dr. Wood's Norway Pine Syrup, and decided to try it. I got two bottles, and as soon as I started to use it I could see it was taking effect. I gave her three bottles in all, and they completely cured her."

Dr. Wood's Norway Pine Syrup is a universal remedy for sufferers from all bronchial troubles. Coughs and Colds of all kinds, Bronchitis, Sore Throat, Hoarseness, Croup, Asthma, Whooping Cough, and Throat and Lung Troubles, disappear quickly after a few doses have been taken.

It will stop that distressing, tickling sensation in the throat which causes coughing and keeps you awake at night.

Price, 25c; large family size, 50c. Put up in a yellow wrapper; three pine trees the trade mark; manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Refuse substitutes.

Spray Mixtures and Spraying.

(Continued from page 372)

ple Scab begins to grow rapidly less and the all important thing is to get the apple safely through June, because there is seldom danger in July

All are aware that two years ago the injury by Apple Scab was done chiefly in the latter part of August and in September. This injury could have been largely percented by an application of spray mixture the last week in August, supplemented perhaps by another about two weeks later. This would also help greatly to prevent the Fly Speck, Inky Spot or Sooty fungus, all of which are supposed to be but different names for one disease.

MIXTURES TO BE USED FOR EACH APPLICATION.

For the first application use lime sulphur, (experiment if you wish on part of the orchard with soluble-sulphur), of the strength of 1 gallon of the commercial diluted to 0 or 10 gallons with water, or to a specific gravity strength of 1,030, that is if the spraying is done before the buds have burst. If it is postponed until the buds are bursting or have just burst, dilute each gallon to about 15 gallons, or to about specific gravity 1.020 Bordeaux in this latter case should also be satisfactory. If Tent caterpillars, canker-worms or other troublesome biting insects are present add 2 to 3 lbs Arsenate of lead to each 40 gallons of the mixture.

For the second application, the one just before the blossoms open, use either Bordeaux mixture with about 2 or 3 lbs. Arsenate of lead or about 1-3 lb. Paris green to each 40 gallons or Lime-sulphur of the strength of 1.010 specific gravity or the commercial diluted 1 gallon to about 50 and with it 2 or 3 lbs. Arsenate of lead to 40 gallons.

For the third applicatian, the one just after the blossoms have nearly all fallen, use lime-sulphur, 1 gallon, of commescial diluted to about 25 or 40 gallons ar about specific gravity 1.009 or 1.008 with a lbs. Arsenate of lead to 40 gallons.

For the fourth application the same strength of lime sulphur as for the third should be used, it will probably be better to add 1 lb. or 2 lbs. of Arsenate of lead as it usually increases the fungicidal action and seems also to help the sticking power. Do not spray at this time in the heat of a hot, calm, sunny day for fear of sunscalding the fruit

For any later applications such as a wet cold August or September may require use either the same strength of lime-sulphur or Bordeaux Mixture, the latter in the later applications not being nearly so likely to cause russeting as when the fruit is just forming or is still quite small.

EQUIPMENT FOR SPRAYING.

It is impossible to do good spraying without a fairly good outfit kept in good repair. The utmost precautions should be taken to see that the pump, hose, nozzles, shut off and everything is in good working order before starting, and to keep them so throughout the season.

Machines. If a man can afford a good gasoline outfit of a kind known to be reliable he will be delighted with it and do better work on large orchards of old trees than with any kind of hand pump, he will also do the work in less than half the time andnot require so many men. Many however, make the mistake of trying to cover too many orchards with one machine. I think one should not expect to do more than 25 acres of old trees with one gasoline outfit, and 12 acres with a good, double-acting pump. A barrel pump will do 8 ac-

100 p. c. Increase in Crops

The French Minister of Agriculture says that farms in Europe have doubled their productiveness in 100 years, and that 70 p. c. of this is due to the use of commercial fertilizers.

Such an increase could be obtained only by using good fertilizers. "Made at Windsor Fertilizer" is not only good fertilizer, but the best fertilizer.

It is manufactured at

WINDSOR, NOVA SCOTIA

in the largest—best equipped—and most up-to-date Fertilizer Factory in Canada.

When you buy your fertilizer ask "Is this Fertilizer made at Windsor, Nova Scotia?" If the man says "Yes", you are getting the best.—If he says "No", you are not.

Write us and we will give you the name of the nearest "Made at Windsor, Nova Scotia" Fertilizer Agent.

Don't Go On Getting Half or Quarter Crops!

Buy a Spramotor

There are too many men engaged in agriculture who think that when they have tilled and cultivated, they can wait for the fields and orchards to return them the full reward of their labor. A bigger mistake was never made. Only by protecting your trees and plants from pests and disease can you get all that they will produce.

Spraying is no longer on trial. It has been proven to be a necessary operation. The world's best authorities are unanimous in advocating proper spraying of orchard trees, row crops and grains. Find the men who make most money out of fruit growing, market gardening or grain growing and you'll find that they are the most consistent spray-users in their community.

The Spramotor Fills Every Need

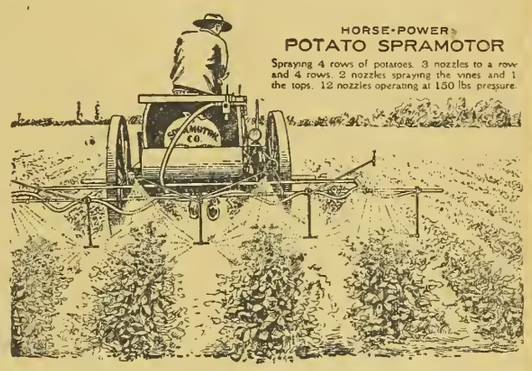
It is twenty years since the first **Spramotor** was sold. We continually receive letters from men who bought our machines away in the nineties, stating that their **Spramotors** are still in active use and doing good work. We have supplied the leading universities and agricultural experimental stations of this country and the United States, also the Governments of both countries. **Spramotors** have been shipped to India in 200 lots, for use in the tea gardens. We have also supplied them to the West Indies, Finland and Belgium.

We make a **Spramotor** for every need—for the small farm and for the largest. There are over 50 different styles and sizes in the **Spramotor** line, including hand machines horse-drawn and horse-operated outfits and gasoline power Sprayers.

Prices Range From $6.00 to $350.

No two men's requirements are exactly alike. We prefer to have you give us some idea of what you want a **Spramotor** to do and then to send you full details of the machine that will suit your case best. We go carefully over the information you supply and then determine which Spramotor will do your work to the greatest advantage at the least possible outlay on your part.

Bear in mind that we make only **Spramotors** We can't sell you you an engine or a pump or a windmill, but we **can** sell you what the greatest authorities in many countries have pronounced the best spraying outfit possible to make—the **Spramotor**!

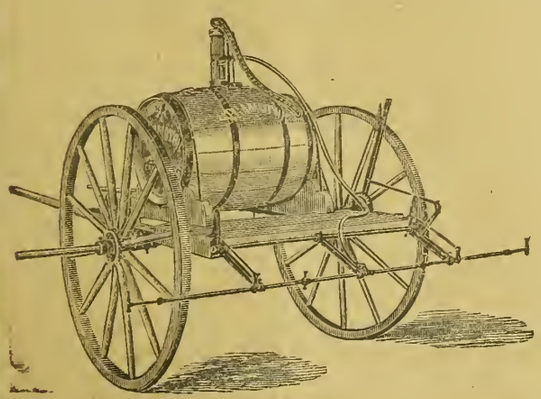


HORSE-POWER
POTATO SPRAMOTOR
Spraying 4 rows of potatoes. 3 nozzles to a row and 4 rows. 2 nozzles spraying the vines and 1 the tops. 12 nozzles operating at 150 lbs pressure.

We Make Every Part That Goes Into a Spramotor

Our plant is completely equipped for turning out every fitting and part used in **Spramotors.** We can make a better nozzle ourselves than we can buy anywhere in the country, and the same applies to every joint, coupling, and fitting that we use. We guarantee every machine shipped, therefore it pays us to be careful to see that each part works to perfection.

Twenty years unremitting attention to the manufacture of **Spramotors** alone, has enabled us to overcome all obstacles and solve many difficult problems. To protect the fruits of our industry and research we have taken out over twenty patents covering improvements that can be found on no other machine. All this experience is embodied in the **Spramotor** of today, and is yours at the same price as you are asked for inferior outfits.



FREE

Write us telling what your spraying needs are and we will mail you a copy of our valuable treatise on Crop Diseases FREE, also particulars of a **Spramotor** that will best suit your purpose. This entails no obligation what ever upon you, so write us without delay.

Read the Opinion of Prof. Bunting of MacDonald College

MacDONALD COLLEGE

Ste. Anne de Bellevue, P. Q
Jan. 19. 1914

The Spramotor Co.,
London, Can.

Dear Sirs:

We used one of your model C power sprayers in our 30 acre orchard last year with entire satisfaction. With two lines of hose we had no difficulty in maintaining a steady pressure with the pump running only about two-thirds of the time, each line of hose throwing as much spray as a man could handle efficiently. We could easily have carried an extra line of hose had we needed it.

I might say that this power sprayer was one of the first power sprayers ever used in this Province and from the interest now being taken in spraying there should be a large number of power sprayers brought in during the next few years, and I feel confident that from our experience with it, your machine will give good satisfaction to any one using it.

Yours very truly,
(Signed) T. G. BUNTING,
Professor of Horticulture.

The London Spramotor, 1724 King St. E., London, Can.

THE APIARY

Who May Keep Bees and Why.

It has been said that "any person who is cautious, observing and prompt will succeed in bee-keeping." This is all true, but he must have a splendid amount of that stick-to-it-ivness which is so essential to success in any business. He must expect to work with full energy, and persist, though discouragement and misfortune both confront him. Capital is good, but not necessary. Men of true metal will bespeak success in advance.

To the specialist, bees in the Maritime Provinces offer a bright future. Bees here in no place, is overdone, and our beekeepers' who combine intelligence with their work are obtaining large rewards. What should the specialist do who puts his whole thought on the industry? Our climate, flora and product is unsurpassed.

Fruit growers need and must have bees to pollenate the fruit blossoms and insure a crop. This opinion is getting stronger with our fruit growers, and our experimentalists annually is proving that bees are not only necessary for the production of quantity, but as much for the quality of fruit. All classes of farmers are giving bees more attention, for the same reason as the fruit grower, and not infrequently find the bees are their most profitable stock. Many of our best bee-keepers live in the town, and add bee-culture to their work in the shop, office or study, and receive health, pleasure and money as a reward. It is an ideal occupation for ladies, they being more observing, painstaking and thorough in their work, seldom meet with the mishap that befall the men.

To those who wish some recreation, there is nothing that has the fascination as the study of the honey bee. Bees from their wonderful instincts, curious structure and habits, and the interesting relation which they bear to vegetable life, are most fascinating objects of study.

The pleasures and profits of bee-keeping is not all. The bee-keeper is a public benefactor, for it is he who makes the "two blades of grass grow where only one grew before." By the increased pollenization of the fruits, clovers, etc., he increases the quantity and quality of the agricultural crops. His is the crop that displaces no other, and in the getting of the same, others are benefited

Now all cannot keep bees. Many are not adapted to such work. Only those who love the study of nature should venture bees. Start in a small way. Get advise from those you know are making a success under as near the same conditions as your own. If you are handy with tools, make your own hives. Read the best literature on bee-keeping you can get. In this way you will not spend much money, gain a lot of valuable information in a short time, and if you should find you are not suited to the business, you will be a broader man for this study and experience.

A last inducement for bee-keeping and certainly a worthy one, is the offering it brings to our table. It is true our sugars and especially our commercial syrups are not wholesome The apiary gives us one of the most delicious and wholesome of sweets, which has received praise from the most ancient time to the present day.

We often hear bees referred to as being profitable, because "they work for nothing and board themselves." Some get the mistaken idea that there is nothing to learn from so small an insect, and success depends wholly upon luck. A bee-keeper must know his bees, and must make the conditions ideal before they can

GIRLS Here is the biggest and handsomest outfit of Dolls and Toys ever gathered together and you can get them all free without a cent of expense. Just look at the picture and then

READ WHAT EACH OF THESE WONDERFUL OUTFITS CONTAINS

First, a big, roomy, red and green summer cottage with curtained windows, wide side verandah and the latest style bungalow roof. You will be delighted when you see how pretty the house looks at night when you place a light inside. Just like a fairy palace. Every girl wants a dandy big doll house. Next comes the dandy farmyard outfit consisting of a big barn, a horse, cow, sheep, pig, donkey, rooster and a motherly old hen with her little chicks. You can give dolly a real day in the country. Then we give you a dainty baby dolly who will enjoy being dressed up when company comes or put to sleep in her lovely little canopied bed inside the house. Of course, we give you the bed above complete with canopy, mattress, spread and all. It will delight you. NEXT COMES THE BEST GIFT OF ALL—this beautiful big Parisian sleeping doll fully dressed from hat to shoes in the latest fashion. She is fully 13 inches tall, is fully jointed so that she can sit down, move her arms, legs or head, and she shuts her eyes and goes to sleep just like a real baby. Last but not least we give you this doll's Fairy Kitchen set of 5 pieces—a good start toward furnishing dolly's kitchen. Girls, there are 17 pieces in this great outfit and no such delightful doll outfit as this has ever before been offered.

SEE HOW EASY THEY ARE TO GET. Simply send your name and address to-day and get by return mail 30 of Yvonne's Hearts of Flowers, the latest Parisian perfume, to sell among your friends at only 10 cents each. They are easy to sell because we send eight delightful odors, such as Beauty Rose, Lily of the Valley, Lilac, Wood Violet, etc., and everybody wants to try two or three kinds. Return our $3.00 when your sales are completed and we will promptly ship the whole outfit (17 pieces) exactly as illustrated above. Hurry girls and write to-day.

THE T. EATON Co LIMITED
TORONTO - CANADA

be made a success. Every bee-keeper has his own problems. Wintering, spring, dwindling, and the prevention of swarms are often a matter of location. The man who knows his conditions, can soon overcome those, but he who depends on luck, will never make a success. Mr. R. F. Holtermann, of Brantford, Ont., who harvested a crop of honey last season of over forty tons, says he neither looses or expects to lose any greater per cent of his colonies, than the successful stockman will loose of his live stock. This man is making bee-keeping a success, but it has only come with work and study. Put the same amount of intelligent work on your bees, as you would have to on any other branch of business, and success is assured.—E. L. Colpitts, Petitcodiac, N. B.

Make what you can out of this. It is taken from an English journal, which says: "At an agricultural meeting some remarks were made on the various remedies which had been recommended for the cattle plague, one of which was the following:—"That the therapeutic inferences drawn from the stgte of the peritoneum, the capillary engorgement of the omasum and the hyperdermic condition of the tissues, point to the organic hypsosulphites and the salicine with hypodermic and subcutaneous injection of morphia and ferruginous preparations as the best remedy."

Spray Mixtures and Spraying.

(Continued from page 386)

res or so well but more in an ordinary season.

Agitator. A good agitator kept constantly working is very essential. The importance of good agitation is often overlooked. It keeps the mixture of uniform strength.

Nozzles. Another requisite is good nozzles. We are all using in Ontario the large disc nozzles of various makes. Most of these have two or three plates with them, one with a large opening, one with a small and another with a medium size. This enables a man to get a fine or coarse spray by merely changing the plates. For the Codling Moth spray the angle nozzle is a necessity. I like it also for the other sprays as a rule. It enables a man to send the spray in whatever direction he wishes, and also helps to prevent unnecessary waste

Hose. The best hose is usually the only one that should be purchased. For the man on the ground I like about 35 feet of hose, and about 12 to 14 feet for the man on the tower. This long hose for the former enables him to spray the tree behind while the man on the tower is doing the top of the next tree. Thus the men do not drench each other.

Pole. A ten-foot spray pole made of bamboo with an aluminum rod inside is to my mind most satisfactary for the man on the tower. It is light and if properly used will last for years. For the man on the ground 7 feet is a long enough rod usually. To prevent drip we cut a circular piece of leather about three inches in diameter, make a hole in the centre and place it just behind the nozzle or nozzles.

Strainer. If we are to push the work along with as few stops as possible a good atrainer with about 10 meshes to the inch is absolutely necessary so that the mixture may not clog the nozzles.

Tower. For tall trees a good strong tower about 5 or 6 ft. high is very necessary for thorough rapid work. The spray machine should always be well cleaned after each day's work by pumping clean water through it. I also loosen the nozzles to prevent setting.

TESTING THE MIXTURE.

If Lime-sulphur is used it should always be tested with an hydrometer before diluting it. A good specific gravity hydrometer can be secured for 80. postpaid. The testing is easily done. See my bulletin No. 198 pages 10 to 13, or the lower part of the spray calendar. Unless each barrel of the commercial or home-made concentrated is tested one never knows what strength he is putting on his trees.

METHODS OF APPLYING THE SPRAY.

In most cases the spraying should be done with the wind and in most cases the stronger this is the better for large trees as it carries the mixture right through them. As we can never be sure that the wind will change to the opposite direction in time to get the other side done before the calyces close, it is necessary to spray at least two-thirds of the tree as thoroughly as possible from the first side. Ta accomplish this, stop the waggon just before it comes to the tree and spray as far as you can on this side. Then drive directly opposite the tree and do this part. then go a little past it and finish as much of this side as can be conveniently reached. If this is done it is very seldom that the wind will not veer sufficiently to enable the rest of the tree to be done, even though not so thoroughly as if the wind were to change directly opposite. Where trees are wide it is often a good plan

Do not Spend your Money on Incomplete Fertilizers

That is do not buy a fertilizer, low in POTASH, because you will not get maximum yields from your farm.

Agricultural Authorities prove that all crops remove from the soil more POTASH than Phosphoric Acid; therefore, the folly of using a fertilizer containing less POTASH than Phosphoric Acid.

We will tell you the right kind of fertilizer to use—one that will make more money for you.

Having **POTASH, Acid Phosphate, and Nitrate of Soda** in stock, can quote you attractive prices on these three fertilizer materials, and will show you

How to Mix Your Goods at Home and Save Money

Make up your mind to have bigger crops this year by using the right kind of fertilizer.

With a high grade POTASH fertilizer you can get crops that will pay you many times over for the cost of fertilizers.

Drop in and let us tell you HOW TO MAKE MONEY FROM YOUR FARM.

A. R. WETMORE,
CLIFTON, - - - N. B.

Big Ben

Hitch Your Sleeping Schedule to Big Ben

Big Ben will wake you early enough for profitable before-breakfast action. His gentle get-up *call* starts the day with a *flying start* on thousands of farms.

For your accommodation he rings TWO WAYS. He'll get you up by degrees or in a hurry. Set him either way you wish—to give one long five-minute ring, or ten short rings at one-half-minute intervals, until you're wide awake.

He stands 7 inches tall; is triple-nickel plated over a tested implement steel coat, the handsomest and truest thoroughbred in the clock world. He has big, bold numerals and hands that show the time plainly at a glance, large keys that anyone can wind easily, and such a pleasant tone that you are glad to get up when he calls.

Big Ben makes early rising easy. He's the leader of the early morning brigade. His cheerful "good morning" ring calls millions of live wires to action. Thousands of successful farms are run on a Big Ben schedule. He starts you off right in the morning and keeps you right all day. From "Sun up" to "Lights out" he regulates your day. He'll work for 36 hours at a stretch and overtime, if necessary. The only pay he asks is one drop of oil a year.

He is sturdy and strong—built to last a lifetime. Yet under his dust-proof steel coat is the most delicate "works." That's why his on-the-dot accuracy has won him fame.

Big Ben's wonderful sales are due to his having "made good." His biggest hit has been with folks with the "make good" habit. He stands for success—that's why you'll like him for a friend.

When 3 million families find Big Ben a good clock to buy and 20,000 dealers *prove* he's a good clock to sell, it's evidence that he is worth $3.00 of *your* money. Suppose you trade $3.00 for him today.

A community of clockmakers stands back of him. Their imprint, *Made in La Salle, Illinois, by Westclox*, is the best alarm-clock insurance you can buy.

Her HEART and NERVES

Were So Bad She Could Not Sleep.

To those who sleep in a kind of a way, but whose rest is broken into by fearful dreams, nightmares, sinking and smothering sensations, who wake in the morning as tired as when they went to bed, we can recommend Milburn's Heart and Nerve Pills. By taking them you can have your old, peaceful, undisturbed, refreshing sleep back again.

Mrs. Chas. Teel, Horncastle, Ont., writes:—"Just a few lines to let you know what Milburn's Heart and Nerve Pills did for me. My heart and nerves were so bad I could not sleep, and the least noise or excitement would make me feel so that I used to think I was going to die, and I would tremble until I could hardly stand. I took doctor's medicine, but it did not do me much good. At last I tried Milburn's Heart and Nerve Pills, and I can certainly say they did me a great amount of good. I can recommend them to anyone who is suffering as I was."

Milburn's Heart and Nerve Pills are 50c. per box, 3 boxes for $1.25 at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

when finishing to hold the nozzles high and let the spray drift through the top; because in wide trees it is very hard without high pressure to get every part of the leaves, calyx and fruit covered on account of intervening leaves and branches.

Sometimes weather conditions and the stage of the blossoms or buds make it imperative that the whole orchard be sprayed without any delay such as is caused by waiting for the wind to change. In such cases one can spray as follows: Suppose the wind is blowing from the East, drive in a direction parallel withthe wind, the horses always facing it, that is, spray along the roads running East and West, starting always at the west end so that the horses may not get wet. As soon as the east end is reached turn around and go back to the west end and up the opposite side of the row thus finishing each row as you go. In this method one has, of course, to spray the west end of each tree against the wind, but this is only a small part of the tree and the east end of it gets tull benefit of the wind. In spraying the north and south sides respectively it is necessary to reach as far in towards the centre of the tree as possible, and it is wise to turn the nozzles against the wind because in this way one will cover both sides of the fruit, leaves or calyces, since the wind will drive the spray back again through the tree. Very good and fairly rapid work can be done in this way. The only trouble is that the man on the ground is likely to be drenched by the man on the tower. To prevent this he should wherever possible work in advance of tne latter as being lower he is not likely to wet the other.

If the Codling Moth is not very troublesome I should advise using a fine mist spray as this saves the mixture, makes it easier to pump, and gives just as good results. The plate with the small opening will, of course, give the fine mist. Most books on spraying will advise you to stop spraying just as soon as the leaves begin to drip. In Ontario I always attack this statement and have never had any reason to regret doing so. My advise to our men is always this. "Stay at the trees until you are satisfied with every leaf, calyx or apple has been thoroughly covered and don't worry if this causes the mixture to drop like rain from the trees." It is only from this thorough work that we can get really satisfactory results. Every man who does this at the right time is getting results and is delighted, others who do not are blaming everything except themselves for the failure to destroy Codling Moth, Scab, Ccale or other pests.

We find it necessary to use about 6 or 7 gallons of mixture for a tree 40 years of age for the application just before the blossoms open and 10 gallons just after these have fallen. Of course, we probably have to spray heavier than you at this time because the Codling Moth is a great pest in many of our orchards. If it were not bad 6 gallons or 7 would probably do us.

The first application before or as the buds are bursting takes about the same amount or a little less. In it we spray from the topmost twig to the base of the trunk at the ground because we want to keep our trunks healthy as well as our branches and twigs. In any orchard where Canker is troublesome I should advise you to spray the bark as well as the leaves and fruit at each application to prevent canker spores germinating and causing new cankers.

As to pressure any one who has used a gasoline outfit at 200 lbs. pressure soon sees how helpful for thorough quick work high pressure is. I should urge that one use as high pressure as he can conveniently get. To get good pressure often means repacking the pump, it means also keeping all fittings tight and in good working order.

I think that it must be difficult for the fruit growers of Nova Scotia to learn what real thorougn spraying means, because unlike us you have not had to choose between this and the loss from 40 to 80 per cent. of your fruit from the Codling Moth, or in a few of our districts the destruction of the trees by San Jose Scale. So I cannot emphasize too strongly the need of using the greatest intelligeoce in soraying and seeing to it tnat the work is done promptly, and thoroughly. Remember that there is no miracle about it. Good work gives good results, poor work is most discouraging. If you are not going to spray thoroughly you will be disappointed with the results but if you spray thoroughly and at the right times you will be delighted with the results and will prove for yourself that the claims made for it are justified. W

Dr. Morse's Indian Root Pills

exactly meet the need which so often arises in every family for a medicine to open up and regulate the bowels. Not only are they effective in all cases of Constipation, but they help greatly in breaking up a Cold or La Grippe by cleaning out the system and purifying the blood. In the same way they relieve or cure Biliousness, Indigestion, Sick Headaches, Rheumatism and other common ailments. In the fullest sense of the words Dr. Morse's Indian Root Pills are 47

A Household Remedy

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

"NOW I have the best roof in this township. One that will last—one that's waterproof—one that will resist the hardest storms—and I didn't have a bit of trouble laying it."

That's about what every Amatite owner says. Its superiority over all other ready roofing is apparent to any one who uses it.

Amatite does away with all roofing troubles and unnecessary expenses because it is made with a real mineral surface that *needs no painting*. It is durable, fire retardant, practical, economical.

Don't buy any other roofing till you look up Amatite.

12 Tumors Removed Without An Operation

Silver Lake, Ont., Sept. 20, 1909.

Dear Mrs. Currah,—I am enjoying better health than I have for eight years, and I think I am entirely cured. I have none of the old symptoms. I am very grateful for my present health, and think Orange Lily is the greatest treatment for women the world knows. Its use in my case caused 12 tumors or growths of some sort to be expelled. Some were as large as a hen's egg, and others smaller, down to the size of a walnut. You may use my case in your advertisement, for it is the solid truth, and pen cannot describe all the good it has done for me. Mrs. Louise E. Boiteridge.

This letter gives an indication of the positive benefits that always follow the use of Orange Lily. It is an applied treatment and comes in direct contact with the suffering organs. It produces results from the start in all cases of women's disorders, including painful periods, failing of womb, irregularities, leucorrhoea, etc.

I will send a sample box containing 10 days' treatment absolutely free to any suffering woman who has not yet tried it if she will send me her address. Enclose 3 stamps and address MRS. FRANCES E. CURRAH, Windsor, Ont.

Wonderful New System That Even a Child Can Use.

He—"You surprise me! You told me yesterday you couldn't play a note!"
She—"I couldn't; I learned to play in one hour by the wonderful 'Easy Method Music.'"

Impossible, you say? Let us prove it at our expense. We will teach you to play the piano or organ and will not ask one cent until you can play.

A musical genius from Chicago has invented a wonderful system whereby anyone can learn to play the Piano or Organ in one hour. With this new method you don't have to know one note from another, yet in an hour of practice you can be playing your favorite music with all the fingers of both hands and playing it well.

The invention is so simple that even a child can now master music without costly instruction. Anyone can have this new method on a free trial merely by asking. Simply write saying, "Send me the Easy Form Music Method as announced in The Maritime Farmer

FREE TRIAL

The complete system together with 100 pieces of music will then be sent to you Free, all charges prepaid and absolutely not one cent to pay. You keep it seven days to thoroughly prove it is all that is claimed for it, then if you are satisfied, send us $1.50 and one dollar a month until $6.50 in all is paid. If you are not delighted with it, send it back in seven days and you will have risked nothing and will be under no obligations to us.

Be sure to state number of white keys on your piano or organ, also post office. Address, Easy Method Music Co., Wilson Bldg., Toronto, Canada. 13

The "New Century" SMILE

Is worn by every housewife who uses one of these washers. The reason is quickly found for the New Century makes washing easy. It removes the hard rubbing and does the work more thoroughly than any other way.

The New Century Hand Washer works quickly and easily. It gushes the water through the fabric, leaving it sweet and clean in a few minutes. It cannot injure the finest garment you possess.

The product of twenty-five years experience in making washers, the New Century is without an equal. Patented features make it the leading hand washer.

Examine it at your dealer's or send to us for information.

The Westmorland Poultry Show

(Continued from page 377)

Pen, Class 97—Won by Samuel Steeves.

Barrel Cornmeal, donated by the Fawcett Mfg. Co., for best Breeding Pen, Plymouth Rocks, Barred—Won by Watson Lutz.

Clock, donated by Mr. A. H. Melanson, jeweler, for best Cockerel and Pullet, S. C. White Legharns—Won by Odbur James.

Box Cigars, donated by Messrs. Baird & Peters, for best Cockerel and Pullet, any variety Leghorns, except S. C. White—Won by Hartland Poultry Yards.

$2.00 Cash, donated by Mr. A. B. Bray, for Whitest Bird in Show—Won by Samuel Steeves.

$3.00Cash, donated by Mr. C. S. E. Robertson, for best Cockerel and Pullet, English breed—Won by Hugh Jardine, Jr.

$2.00Cash, donated by Mr. J. H. McInnes, for best Cockerel and Pullet, White Wyandottes—Won by Samuel Steeves.

Pair Boots, donated by Doyles, Ltd., for best Cockerel and Pullet, S. L. Wyandottes—Won by S. E. McKie.

$2.00Cash, donated by Mr. B. A. Lutz, for best pair Barred Rock Pullets, utility—Won by Allison Lutz.

Pair Boots, donated by J. J. Bourgeois & Co., for best Cockerel and Pullets, Light Brahmas—Won by Harry Day.

1 Ton Coal or $5.00 in Gold, donated by Moncton Fuel, Ice & Cartage Co., for best Cock and Hen, White Wyandottes—Won by Samuel Steeves.

$2.00Cash, donated by Mr. A. R. Whimby, for best Cockerel and Pullet, Rhode Island Reds—Won by Wm. J. Major.

1 Poultry Book, donated by the Reliable Poultry Journal, of Quincy, Illinois, for youngest exhibitor—J. E. McEachern.

For 4 Best Birds, Wyandottes, any variety, $2.50, donated by Mr. J. Edington—Won by Samuel Steeves.

For 4 Best Birds, Leghorns, any variety, $2.50, donated by Mr. J. Edington—Won by Odbur James.

The usual annual banquet of the Association was held in the course of which the various speakers were most optimistic in regard to the future of the poultry industry in general and the Westmorland Poultry and Pet Stock Association's Show in particular.

The Cape Breton Poultry Show.

The third annual show of the Cape Breton Poultry Association was held in St. Marv's Hall, Sydney Mines, on January 20th, 21st, and 22nd. The display of birds was above the average in quality. Many birds brought in from outside points at large figures were not successful in getting first money. The poultry men of Cape Breton are now breeding some very fancy show stock and expect to make a good showing at next winter's fair at Amherst. Prof. Landry judged the show in his usual prompt and pleasing style.

There was not one protest lodged with the management against his decisions. Which fact is certainly pleasing to everybody.

An entry list of 600 birds shows the awakening interest in the poultry business.

Single Comb Rhode Island Reds led in quantity of birds in any one class, there being 52 birds in the open class not including pens.

There was a splendid showing of White Leghorns, White Wyandottes, and Barred Plymouth Rocks.

The attendance at this first poultry show held at Sydney Mines was very poor. Not nearly up to the expectations of the management.

Barred Plymouth Rocks—Cock (5)—W. B. Ross, W. M. Voognt, T. C. Munn. Hen, (8)—T. C. Munn; 2 and 3, W. M. Vooght. Cockerel, (9)— 1 and 3, W. M. Vooght; 2, T. C. Munn Pullet (14)—1 and 3, W. M. Vooght; 2, W. B. Ross; 4, T. C. Munn.

White Plymouth Rocks—Cock, J. Barrington; Hen, 1, 2, 3, J. Barrington; Cockerel, C. W. Lovett, George Musgrove, J. Barrington. Pullet, C. W. Lovett, Geo. Musgrave, J. Barrington.

Buff Plymouth Rocks—All prizes went ta Rev. W. R. Turner.

Silver Wyandottes—All prizes went to S. H. Rudderham.

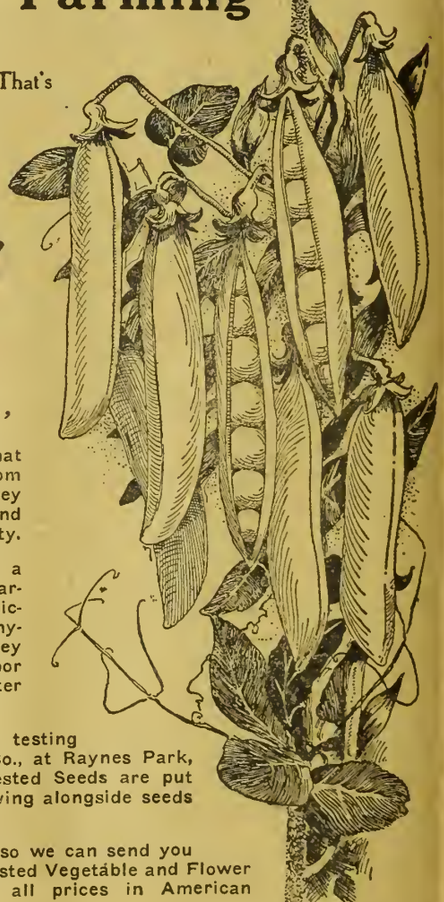
"Intensive" Seeds for Intensive Farming

Bigger crops per acre!

That's intensive farming. That's what every farmer wants.

But to get bigger crops, you must sow better seeds,—intensive seeds,



Carters Tested Seeds

"Seeds With a Lineage"

By "Tested" we mean first, that Carter's Seeds are free from dirt and weeds, second that they are tested for germination and production as well as for purity.

Carter's test, therefore, is a triple, threefold test, and Carter's Tested Seeds are practically a sure thing, as sure as anything on earth can be. They never waste your money, labor or time. They net you a greater profit.

At the famous trial and testing grounds of James Carter & Co., at Raynes Park, London, England, Carter's Tested Seeds are put to the real test of actual growing alongside seeds produced by rival growers.

Please write us your address so we can send you a free catalogue of Carter's Tested Vegetable and Flower Seeds—special edition, with all prices in American currency.

TALK No. 3
ON THE
"GEORGE" STEEL GALVANIZED SHINGLE

Now for a little talk on the QUALITY of
PEDLAR'S PERFECT PRODUCTS

IN this respect our customers get the fullest protection. All steel used is specially selected. It is actually higher priced stock than is considered standard.

It must be level and free from surface defects.
It must be galvanized to stand the copper sulphate test for coating.
Care in manufacture, retrimming of sheets and triple inspection guarantee a perfect fit.

"Pedlarize" your buildings by using the big "GEORGE" Shingle (24 in. x 24 in.) on your barns, and the smaller "OSHAWA" Shingle (16 in. x 20 in.) of identical pattern and quality on your houses, sheds and smaller buildings. They will outlast the building and the builder.

PEDLAR'S METAL SHINGLES PROTECT YOU FROM
FIRE, WIND, WATER AND LIGHTNING

Get our prices on Siding, Corrugated Iron, Vents, Eaves Trough, Conductor Pipe, Finials and Ornaments. Every article is standard throughout Canada.

The All-perfect Metal Shingle. No greater cost, but greater service and satisfaction. : : : :

Silver Cup donated by the Cape Breton Poultry Association awarded for the highest aggregate in the Single Comb Rhode Island Red Class. won by T. C. Munn.

N. B. Farmers and Dairymen in Annual Session.

(Continued from page 367)

bury, Henry Wilmot; Westmorland, J. R. Taylor; Victoria, A. J. Jensen; York, Ludlow Hoyt.

The convention, which closed on Friday, was one of the best in the history of the organization. The attendance reached over the 200 mark and a lot of practical work was accomplished. One measure which will be promptly dealt with is that con- in thegoods . A request will be made percentage of plant food is contained zers, so as to show exactly what cerning the proper marking of fertili- to tne Dominion Government tc amend the act so as to compel this. Hon. J. A. Murray has undertaken to present the claim in person at Ottawa and in response to his request that the association appoint a man to accompany the minister to Ottawa, Mr. Durost was named.

The last day of the convention was as busy as the others and many important subjects were discussed.

Potato culture was treated by Dr. Robert Newtown and C. Fred Fawcett, and these men brought many points in regard to the planting, cultivation and harvesting of potatoes.

Dr. Newton explained the best means of culture and advised each farmer to have an experimental plot of his own where he could try out different kinds of seed and methods. He thought this was a good plan for other crops besides potatoes.

The speaker soon had all the delegates interested and there was a discussion that brought out the different phases of the potato business that proved particularly helpful.

New Brunswick he thought presented ideal conditions for potato growing and he urged the farmers to secure as large a yield as possible.

During the meeting it was decided to rearrange the by-laws governing the organization and the following committee was appointed to draw up the new regulations and submit them at the next meeting: W. W. Hubbard R. G. Murray, S. L. Peters, Thos. Strong and A. R. Wetmore.

In the afternoon R. P. Gorham talked on potato diseases. He enumerated the different infections found in New Brunswick and described ways of treating these. He particularly warned the farmers of the Powdery Scab infection and urged them to unite with the Department of Agriculture in stamping out this plague.

After the judging of the seeds entered in the provincial seed fair, the meeting adjourned.

It is likely that a mid-summer meeting will be held when the members will assemble at the experimental farm at Doak and besides transacting business will have an opportunity of seeing the produce of the farm and investigate the methods of farming.

Farmers from all sections of the province had seed entered at the fair and the specimens were said to be better than usual.

The winners at the Provincial Seed Fair were as follows:

White Fife Wheat—1st, E. Lorne Hume, Florenceville; 2nd, Bertrand Goodspeed, Penniac; 3rd, Henry Gordon, Chatham; 4th, A. R. Gorham, Gorham's Bluff.

Red Fife Wheat—1st, Henry Gordoa, Chatham; 2nd, Donald Innis, Tobique.

White Russian Wheat—1st, T. Coy Goggin, Elgin; 2nd, H. B. Parlee, Sussex; 3rd, G. J. Dickson, Chatham; 4th, Henry Gordon, Chatham; 5th, Walter Payne, Lake Edward.

Any Other Variety Wheat—1st, Edward M. J. Jarvis, Stanley; 2nd, R. N. Underhill, Underhill.

Special Competition (open to all)—

"Staying" Quality

WHEN you buy a horse the important thing is—what will he do, and can he keep it up; not merely what is his price. A horse always looks like a horse, but what is *in* him cannot always be seen.

This also applies when selecting a fertilizer; they all *look* alike—but looks don't tell whether they are able to start a crop and keep it growing. Those that won't do it you do not want at *any* price.

A good fertilizer, like a good horse, has "staying qualities" and these qualities are possible only when the plant feeding elements are rightly balanced, with the right proportion made soluble and ready for rapid assimilation by the plant when it most needs them. When it wants to *grow* fast it must *feed* fast, and having made a good growth, must be fed to maturity. A good fertilizer will not forsake the crop half-way through its growing period.

BOWKER'S FERTILIZERS

are built on a quality basis; they are made to feed fast and also to hold out; they are made to bring the bushel cost low and the quality high.

In our recent Potato Contests, fifty-three crops in fifty-three different parts of New England, raised by fifty-three different farmers averaged 326.2 bushels per acre. Weather and cultivation differed in each instance; the only condition that was alike in every case was the use of Bowker's Fertilizers. Can you beat such a record? Not with any other fertilizer.

Apply your horse-buying principles, and good "horse sense" in buying your fertilizers. All your life you have known Bowker's Fertilizers and their reputation—this year give your crops a chance to show what they can do in quantity and quality on Bowker's. Your profit can come only from your yield—therefore, you **must have able help in the soil.** This, Bowker's will give you—and through its use you get quick action and profitable yields.

Only a quality fertilizer can produce a quality crop.

Our Local agents will supply any quantity you desire. If, however, none are in your section write us for further information. Also, ask for our book "Plant Food." No advertising in it. It is helpful and it is sent free.

The Independent Desk Set.—The Very Latest thing in Magneto Desk Telephones

Merely to Show the Up-to-Dateness

WE print the above illustration of the very latest thing in desk telephones merely as an example of the up-to-dateness of our telephones and equipment. We claim that our telephones are superior in design, material and workmanship to any others on the market. We are prepared to furnish the proof by allowing you to try them on your line, free of charge. In that way you can judge their quality and efficiency before risking a cent. Write for illustrated description of this set.

Information Gladly Supplied

WE are prepared at all times to supply you with any information desired about telephones and telephone materials. We maintain a big, strong organization of experienced telephone men and qualified telephone engineers, who will plan the construction of your system on the most up-to-date lines, and solve any operation problem you may have.

The service we render our customers is certainly very complete and efficient But we are so closely interested in the success of all independent local and municipal companies, as their success means our success, that it is to our advantage to look after them well.

Write for our No. 3 Bulletin, which gives full particulars about the latest methods of building telephone lines. A copy will be mailed to you free on request. We also send you an illustrated description of our portable telephone or test set if you are interested.

If there is no telephone system in your locality, there certainly should be. Your locality surely shouldn't lag behind others which are enjoying the business and social benefits of up-to-date telephone service.

Write us and we will tell you the necessary steps to take to organize a local or municipal system for your locality Let us quote you on your year's supply of Dry Cell Batteries.

To Make Perches for Poultry.

If there is anything about the furniture of the poultry house that needs careful attention it is the perches or roosts. On these the hens spend over half their time and it is necessary that they be given considerable attention.

The instinct of self preservation prompts fowls to perch on the highest point possible when taking their quarters for the night. They naturally desire to be above danger from below. For this reason the perches in the house should all be on the same level and not one higher than the other in the form of stairs, or there will be crowding and fighting for the high est positions. At some time the weaker hens will be pushed off these high perches, thus resulting in a cripple or death.

The perches should be low. There is no advantage in high roosts. Instead there are several disadvantages. Fowls of heavy breeds are almost certain to injure their feet flying down from a high roost to a hard floor, and the disease known as bumble feet then results. For the sake of superior ventilation perches should be low. The warmest air in the poultry house is near the roof, and the most impure air is there also. The lower air is purer, more plentiful and more enjoyable than that at the top of the house. Eighteen inches above the floor is plenty high enough to place the roosts.

Perches should be built so that they do not touch the walls at any place. When they do it is much easier for lice to thrive. The fewer creases and cracks wherein lice may find a lodging place about the perches, the better.

The roost poles should be two or three inches wide. Two or three scantling, slightly rounded on the upper edges, will make desirable perches. Then place them so they will be movable in order that they may be taken out of the house and cleaned once in a while.

Effect of Oats on Flavor of Milk.

It has been asserted by some dairymen that the feeding of crushed oats to cows will improve the flavor of milk. To ascertain the correctness of this theory a series of experiments was made by the Bureau of Animal Industry at the experimental dairy farm at Beltsville, Md. Six cows were used in the experiment; three were fed a grain ration of corn meal, bran and cottonseed meal; the other three were fed a grain mixture of five parts crushed oats and one part cottonseed meal. A number of samples of milk from the cows fed these rations were submitted to various persons in the dairy division and they were asked to indicate their preference. In all fifty opinions were passed on various samples. Of these, sixteen showed a preference for the milk from cows fed on crushed oats, twenty-five preferred that from the bran and corn ration, while nine expressed no choice. The results show that in these rations, not only was there no marked difference in favor of the crushed oats as a feed to improve flavor, but, if anything, the ration cantaining bran and corn was more successful in producing a fine flavored milk.

Bruce's Seed Oats

Bruce's Conqueror: A new variety from Northern Europe, very heavy yielder, straw is strong, of medium height, grain is plump, thin skinned, pearly white, and makes splendid Oat Meal. It is hardy and ripens medium early. Peck 40c, bushel $1.25 here.

New O.A.C. No. 72. A new variety, of exceptional merit, an immense yielder and of fine appearance. It is a branching White Oat, early, and the straw is good and strong, the hull is thin and the grain weighs well. Peck 60c, bushel $2.00 here.

New 2½ bushel cotton bags 30c each extra.

Prices of above postpaid, 1 lb. 30c, 2lbs. 55c, 3 lbs. 80c, 4 lbs. 95c, 5 lbs. $1.10. 6 lbs. $1.25.

We can also offer Daubeney, American Banner, Siberian, Abundance, Scottish Chief and Green Mountain, also Black Tartarian and Black Victor.

FREE—Our illustrated 112-page Catalogue of Vegetable, Farm and Flower Seeds, Bulbs, Plants, Garden Implements, Poultry Supplies, etc.

Seed Merchants
HAMILTON, - ONTARIO

Three Weeks Course in AGRICULTURE

At Woodstock Agricultural School

March 9 to 28, 1914

SUBJECTS OF STUDY

1st Week

HORTICULTURE—Orchard sites and soils; varities and nursery stock; planting, cultivation, and cover crops; spraying, pruning and grafting; picking, packing, and judging; insects and diseases. Also small fruits and vegetables.

BEE-KEEPING—Life of the bee; care and management of the colony; honey production and marketing.

2nd Week

FIELD CROPS—Judging and production of grains, grasses, clovers and alfalfas, potatoes, roots and corn.

SOIL MANAGEMENT—Cultivation; drainage; fertilizers; crop rotations; control of weeds.

3rd Week

LIVE STOCK — Breeding, feeding, management and judging of horses, cattle, sheep, and swine.

DAIRYING—Milk production; cream separators; Babcock testing; butter-making.

POULTRY—Egg production; housing; incubation and rearing; judging; marketing.

Outside men of high standing will assist the men of the Department of Agriculture.

SPECIAL NOTICE—Railway fare amounting to $2.00 or more refunded to any New Brunswick Student who remains during the whole three weeks.

Board and lodging in Woodstock at $4.00 per week upwards. A list of boarding houses will be handed to each student on arrival.

NO FEES **NO BOOKS REQUIRED** **NO AGE LIMIT**

For further particulars apply to

POWDERY SCAB OF THE POTATO

Concerted Effort Needed For Its Extinction.

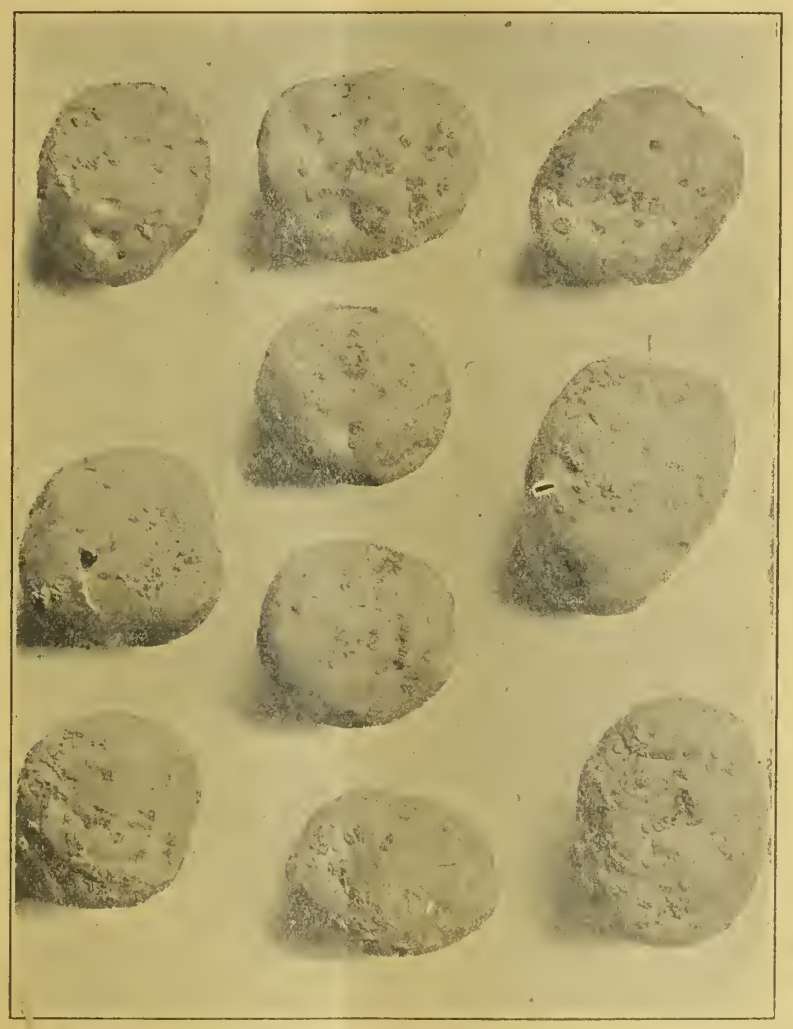
By A. G. Turney, Provincial Horticulturist, Fredericton, N. B.

This disease has been known for many years in parts of Europe and has had a number of different names. It was not until it invaded Ireland about twenty years ago, however, that it began to be recognized as a really serious disease of the potato.

The fungus causing the Powdery Scab of the potato is put in the genus spongospora which according to Professor Stevens, belongs to one of the lowest groups of soil organisms—the Myxomycetesi or slime fungi. None of the fungi belonging to this group form any regular mycelial or root like growth such as characterizes most other fungi. They are more nearly live some of the bacteria or low forms of ameboidal animal life and develop as small foreign bodies with n the cells of the host plant. By their growth they cause the production of abnormal forms or deformities such as the club-root of cabbage, the most common disease caused by fungi of this group. The particular fungus causing Powdery Scab on the potato closely follows this habit in its bad stages by producing gnarled and misshapen tubers showing large sores and areas of corky tissue.

The most characteristic feature of the disease in its mild form is the production of scab spots on the surface of the tubers. These spots vary in size but are usually about one-eighth inch in diameter and either raised or depressed. These burst up through the skin of the potato and if rubbed are found as dark raised sori with the skin at the edges turned back exposing the dark spore mass beneath. When rubbed the raised portions of these sori crumble into a mass of what appears to be dust. This leaves the spot as a slight depression in the skin of the potato. Each little grain of the dust-like powder rubbed off is a single "spore ball" and is composed of numerous spores bound together in a sponge-like mass. These are the spores that spread the disease from field to field and from farm to farm and that cause the soil where the diseased crop has been grown to become a source of infection for succeeding crops.

In the early stages, the disease takes the form of small pimples on the skin of the potato, later on these burst through and expose the mass of alive black spore balls. If the attack is only mild it does not amount to more than a number of these



Potatoes Affected by Mild Type of Powdery Scab

spots on the skin of the potato. Unfortunately, however, the disease often assumes a more injurious stage and causes the formation of open spores and misshapen tubers that are unsaleable and almost unfit for home use. A still worse feature about the disease is that the soil, where a diseased crop has been grown becomes infested with the spores and any succeeding crop of potatoes grown on the same field within eight years is almost sure to become affected. This makes it doubly hard to fight after more than one field on a farm has become infested. There is also the danger of introducing the disease on farms previously clean by the use of the infested seed. Tubers in themselves clean, may carry the spore balls adhering to the skin if they have been in contact with affected tubers or have been handled in barrels or bags previously used for diseased stock.

Inspection work in the province disclosed several districts where the use of a planter in common by a number of farmers appeared to be responsible for the spread of the fungus. In one district in particular over twenty farms were found along one road that showed more or less infestation, not generally amounting to more than 3 per cent. One farm was found where nearly 70 per cent. of the potatoes were infested. A planter had been used for two years on this farm and on all the others where the disease was found. This seemed to point to the badly infested farm as having been the seed ground from which the seed spread to the others. It was further learned that as all were growing the same variety of potatoes it was a common practice to carry on from farm to farm in the hopper of the machine whatever seed was left over from the last farm planted. To emphasize more strongly the spread of the disease in this way three farms were found in the midst of the infested area where a private planter had been used. This planter had never been used on any other farms or with any other than the seed grown on these farms. No signs of the disease were found on the potatoes there.

In another case the disease was found is a somewhat isolated district where it was hard to explain how it had gained an entrance. Enquiries brought out the information that each year a number of young men went from that district to help in the Maine potato harvest and that many of them brought back in their suit cases and grips samples of the Maine potato for seed. This seemed a possible explanation of the way in which the disease reached that district.

Some of the important features about the disease may be summarized as follows:

1. The disease in its mild stages causes unsightly scab spots on the skin of the potato.
2. In the severe stages of the disease it causes the production of deformed and spore-bearing potaeoes that are practically unsaleable.
3. The spores of the disease remain virile in the soil for eight or nine years at least and will start an infection in crops of potatoes planted on the land within that time.
4. The disease once established in one field is spread by succeeding potato crops to other fields until the whole farm becomes infested.
5. The presence of the disease in the soil of any one farm depreciates the value of that farm for any system of agriculture that involves the growing of potatoes.
6. The presence of the disease on one or two farms in a district depreciates the value of all the farms in that district for the sale of export of seed potatoes.

Mutton--From Field Across the Block to the Kitchen

By T. G. Paterson, Division of Animal Husbandry
University Farm, St. Paul, Minn.

Cuts by Courtesy of University of Minnesota

The food value of mutton is practically the same as that of beef except that as a rule mutton is a little fatter and consequently carries a smaller percentage of water than beef. Good mutton should be covered evenly with firm white fat. The color of the flesh varies from a very dark red in old, thin mutton to a cherry red in the best grade of fat, native mutton. It should be free from disagreeable odors and the carcass should be dry to the touch. In mutton of best quality the lean meat should be fine grained, smooth or velvety to the touch and have an admixture of fat with the lean is not so great as is found in beef.

All classes of sheep carcasses should carry an even, moderately thick covering of fat, to make really high class cut. Fat meat always has more flavor than thin meat. It contains less water and does not shrink much in cooking.

Mutton and lamb should be used to a greater extent by our people for the following reasons: It is as cheap as beef and the stewing cuts are generally the cheapest meats that can be purchased. Cleanly dressed mutton and lamb is just as palatable as any other class of meat and many people maintain that it is a better flavor.

Fig. 1. Handling a Sheep
(A) Right Way
(B) Wrong Way

Fig. 2. Sticking a Sheep on a Box to Prevent Soiling the Fleece.

Whole or half carcasses of mutton may be used by the family before the meat spoils. They furnish a change from the constant use of beef and pork. Sheep have very few contagious diseases and fewer sheep carcasses are condemned in packing plants than any other class of animals. Mutton is not excluded by any large class of people on religious grounds.

DRESSING SHEEP AND LAMBS

Tools.—The tools and conveniences necessary for dressing sheep are; a good sharp knife, a steel or whet stone, a small platform or box to keep the carcass off the ground, some convenience for hanging the carcass,

MUTTON OF QUALITY

strong piece of twine, a few wooden pegs or skewers, a pail of warm water, a cloth for washing the carcass, and a towel with which to keep the hands clean and dry.

Preparing the Sheep.—Wherever possible, it is advisable to take the sheep off feed for from twelve to twenty-four nours before slaughtering, with the exception of lambs, which will fret too much if taken from the dams and will consequently be in a feverish condition when slaughtered. As with all stock, however, sheep should be given all the water they want to drink.

Handling.—Always handle the sheep quietly so that they do not become excited and overheated before killing. Special care should be taken to see that sheep are not handled by the wool. Pulling the fleece by grabbing a sheep on the back or on the side as shown in Figure 1, B, will leave discolored, bruised spots on the carcass Kicking or pounding the animal has the same effect. Always catch a sheep by the neck, rear flank, or hind leg and hold it by placing one hand in the groove of the lower jaw and the other at the dock as in Figure A.

Besides causing bruises and discoloration of the carcass, handling by the wool is painful to the sheep. The fleeces of sheep selected for slaughter should be dry, as it is hard to obtain a clean, untainted carcass if the fleece is wet.

After such careful preparation for slaughter, the animal bleeds more thoroughly, the carcass cools out more rapidly, the entrails are easier to handle, the danger of cutting is lessened, the carcass makes a better appearance, and the flesh has a better color.

Dry, Clean, Killing-Place.—Sheep should be slaughtered on a dry, clean place and provision should be made to prevent the blood from coming in contact with the fleece. Remember that the cleaner and dryer the fleece is kept the easier it is to keep the carcass clean. An old door, a wagon box, or a few boards laid on the ground will make a suitable place on which to dress a sheep. A clean piece of grass sod could also be used.

Sticking.—The sheep should be laid on the left side on the edge of the killing floor or placed on a box as shown in Figure 2, to let the blood flow away from the fleece. Also see that there is nothing on which the sheep can get a foothold while struggling. Stand behind the sheep, place the knee firmly in the fore flank just back of the forelegs, pulling it over on its back with your knee until the feet are clear of the floor. Grasp the sheep by the under jaw with the left hand and turn the head slightly. This helps to keep the sheep on its side, but do not pull the head back so far that its wind is shut off causing violent struggling. Stick the knife into the angle of the jaw below and behind the ear, running the back of the knife close to the neck bone and then cut outward, thus severing all the veins and arteries.

Lay the knife down and break the sheep's neck by placing the right hand on the forehead and pulling upward with the other at the point of the jaw. Breaking the neck stuns the sheep and if for any reason the neck cannot be broken, the spinal cord should be cut at the atlas joint to accomplish the same result. Hold the sheep until it ceases to struggle, so that the fleece will not be spoiled with blood. Sheep may be stuck through the neck at the angle of the jaw without cutting out, but the other method is more successful for the beginner. Remember not to lay the sheep on the right side unless you are left-handed and never put the knife where the sheep is likely to hit it with its feet.

Fig. 4. Opening the Pelt Behind.

Opening the Fleece.—After the sheep is dead begin to open up the fleece with the knife. From this point on, it is best to have some definite system to avoid unnecessary work and the chance of forgeting to do things at the proper time. Start at the head and remove the tongue by cutting off the skin from the lower jaw, then cut down each side of the tongue close to the jaw bones loosening the tongue at the point and cutting it off at the root. The tongue should be cleaned in cold water by scraping it from the tip backwards with a knife.

Now start on the right front leg. Put the sheep's foot between your knees letting the carcass lean away from you and keep the leg pulled tight. Then start somewhere on a line between the knee and the shoulder point and cut out a small strip of skin down the front of the leg to the ankle, being sure to take all the pelt from the front of the knee as shown in Figure 3, B. Continue the opening down over the shoulder point to a point in the center of the neek in front of the brisket, and follow the opening down the center of the neck.

Fig. 3. Method of Opening the Fleece

The knife should run flat and the pelt raised as the cut is made so as to avoid cutting turough the fell, which covers the outside of the carcass, and making unsightly gashes in the carcass. Do the same thing on the left front leg, meeting the opening on the right side in front of the brisket. By opening the pelt in this manner a triangular shaped piece is obtained in front of the brisket as shown in Figure 3. A, which is necessary to secure easy skinning of the brisket.

To open the fleece on the hind leg, hold the hind leg by placing the foot between your knees, letting the body of the sheep lie away from you and pull the foot forward, so as to

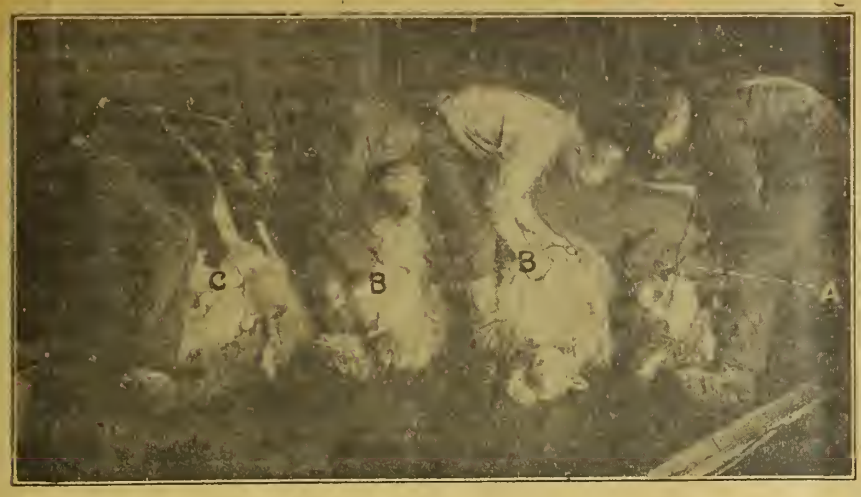


Fig. 5. Fisting-Off the Front End

tighten the pelt as shown in Figure 4, A. Start on the back of the leg somewhere on a l ne between the hock and the tail and cut out a piece of and pelt down to the foot being sure that both dew-claws are removed, then continue the opening to a point just below the tail, running the knife flat so as to avoid cutting the carcass. One should be more careful opening the hind leg than the front because it is the higher priced cut. This method leaves another triangular piece of pelt to aid in skinning off the flank as shown in Figure 4, B. Remember that the opening is made over the back of the hind leg and the front of the front leg. This is practically all the skinning that should be done with a knife.

Fisting-Off.—The next step is to fist-off the pelt from the under side of the sheep. Before beginning, the hands should be clean and dry and be kept so until the pelt is removed. Grasp the triangular shaped piece left in front of the brisket and pull the pelt back over the brisket as far as possible as shown in F g. 5, A. Standing with one foot on the sheep's head will hold the carcass steady. In case of young sheep and lambs the pelt can be pulled back over the brisket, but in case of older animals it may give a little trouble. Begin at either side of the brisket as shown in Figure 5, B, and work off the entire front part of the belly by working the fist between the pelt and carcass as shown in Figure 5, C, keeping the pelt tight with the left hand.

Very often a pelt that sticks at the brisket can be removed by working it loose behind and then pulling it forward. Fist down as far on the sides as is convenient. It is a good plan to fist-off a piece on each side of the opening made along the center of the neck. This will prevent tearing the neck when the pelt is pulled down the back.

Next, start at the V-shaped piece left in the rear and pull it upward, as shown at B in Figure 4, so as to start the pelt. Standing on the dock will hold down the carcass while starting the pelt. Be careful not to tear the flank or pull off the cord or udder, as the case may be, from the carcass. Start to fist along the middle line until the opening has been made that meets the loose pelt. Now work to either side, pushing down the side from the naval and working back across the flank, stifle, and the inside of the leg. If this method is followed there is little danger of teaing the flank muscles, which is nearly always done by a beginner who tries to fist-off the rear part by working straight in from behind.

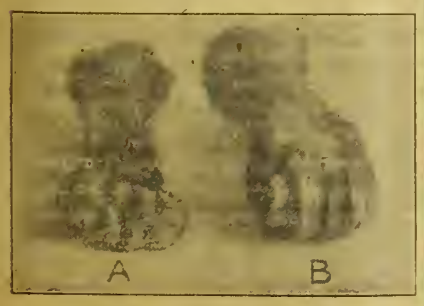

Fig. 6. (A) Break ot Lamb Joint
(B) Mutton or Round Joint

Next, loosen the tendons in the hind leg so that they may be tied together to hang up the sheep. To do this, hold the hind leg in the same position as when opening the pelt and skin around each side of the hock so that a finger can be inserted between the pelt and the hock, then loosen both tendons by cutting between the bone and the tendon on the back of the leg somewhere between the hock and the ankle. Then turn the knife so that the back of the blade is pointing towards the hock and pull the pelt off the leg starting at the place made by skinning around the hock. Skin the leg right down to the foot, then remove the foot at the lowest joint as shown at C in Figure 3. Never remove the foot at the ankle joint because the tendons will pull out and the sheep will then have to be hung by the hock. Next tie the tendons together with a stout cord and hang at a convenient height. By the method described no part of the carcass is exposed until the sheep is hung up.

Removing the Pelt from the Body.—Split the pelt down the center and remove the front toes. The joint, at which the toes are removed will depend on the age of the sheep. In the case of lambs, yearling wethers, and a few young yearling ewes, the toes should be removed at the lamb or break joint, Figure 6, A, by cutting across the raise on the cannon bone just above the ankle and twisting the foot. In the case of long-yearling ewes and all sheep over two years old ,this joint will not break. Therefore the toes will have to be removed at the ankle or mutton joint, Figure 6, B. The best guide in doing this is to cut below and under the dewclaws until the joint is exposed. The point at which the toes are taken off determines to a large extent the selling value of a carcass for it practically differentiates between lamb and mutton. If the break joint is porous and red it is a safe indication that the carcass is that of a lamb, and if dry and brittle the carcass is that of a yearling.

Fig. 7. Steps in Removing the Pelt

Fig. 8. Removing the Head.

The next step is to begin fisting the left side by starting somewhere near the center of the belly and working upward on the leg as shown in Figure 7, A. As a rule always work upward on the leg to avoid pulling the fell from the carcass. Continue fisting-off until the leg is clear and the pelt is loosened to the tailhead or dock on the rightside. Then begin to fist downward to the fore flank working the arm downward over the point of the shoulder through to the opening made in the neck, and pull the pelt from the front leg as shown in Figure 7, B. If the knee has been skinned off in opening the fleece and the toes have been removed, the front leg may be skinned out easily.

The right side should be fisted-off the same way using the left hand but in case you do not use your left hand readily there is no objection to continuing fisting from the left side round to the right side with the right hand. Be careful in fisting-off the pelt on the rump to avoid tearing the rump fat and always work the leg off first because the pelt will then roll away from the carcass and prevent undue soiling of the carcass by the wool. The tail w ll need to be loosened with a knife by cutting a piece from the under side. While doing this it is best to cut around the rectum and loosen it by pulling it out a short distance. Next pull the pelt from the tail down back to the head, being careful not to tear the fell. Pull the pelt down the head as far as possible, then cut off the head where it has previously been broken at the atlas joint. It is best to cut from the under side of the neck outward, as shown in Fugure 8, A, so as to leave all the muscle and fat on the neck, thus avoiding a scraggly, bony neck. After removing the head cut off the ends of the gullet and the windpipe as shown in Figure 8, B, then raise the front legs and make a deep incision immediately in front of the breastbone and continue to cut down the center of the neck. This allows the blood that may be held in the large arteries near the heart to escape and also loosens the windpipe and gullet so that they may be easily pulled out when removing the pluck.

Washing the carcass.—If the carcass has been neatly and cleanly dressed, there will be little need for washing. All that is necessary will be to wipe it with a dry, hot cloth but if it is badly soiled, it is best to wash it thoroughly with hot water being sure to dry it carefully. The hot water will bleach the carcass and give it a whiter appearance. In summertime it is possibly a good plan to wash the carcass on the outside with cold water as this will tend to cool it. If the veins and capillaries on the outside are filled with blood, it is a good plan to scrape along the vein with a knife pushing the blood back to improve the appearance.

Evisceration.—Before commencing to remove the vicera, be sure the windpipe and rectum have been loosened as already described. Begin by making an opening in front of the cod or udder, as the case may be, and open the carcass down the middle line to the breastbone, placing the point of the knife between the fingers to guard against cutting any of the internal organs.

In the case of lambs, or yearling wethers, that are not too fat, remove the caul fat from the stomach being careful not to tear it and lay it on the pelt to keep it warm In case the pelt is dirty, the fat may

THE VALUE OF GOOD SEED.

If you have not already prepared your seed grain do so without delay. Don't sow grain taken indiscriminately from the bin. If you do you will be perpetrating one of the leaks that rob the efficacy of your farm. Fifty percent of such grain is absolutely wasted when used for seed. In the rapid race of growth made by the grain when sowed under favorable conditions only the fittest survive. Small, shrunken grain is no more fit to produce a bumper crop than is unkempt scrubby stock to produce show ring winners. Always bear in mind that one of the laws of nature is that "like produces like," and you cannot change it. You may spend valuable time and money in preparing the soil on which you wish to grow a grain crop, but if you use inferior seed your efforts will be next to wasted. At this season of the year there is only one selection that you can make and that is a farming mill selection. There are sure to be some stormy days between now and seeding time when it will be too disagreeable to work out-of-doors, when it would not pay you to work outside, but if you apply yourself to the work of grading your seed grain on such days, we know of no work that you can do in the course of the year that will prove more remunerative.

If you have no grain that is fit to grade for seed it will pay you to buy from some reliable grower who practices a good system of selection. If there is no such farmer in your vicinity write to some reliable seed firm for your needs, you will find their ads. in the MARITIME FARMER.

What the MARITIME FARMER would advise its readers to do in this line would be to purchase some registered seed, get in touch with the Canadian Seed Growers' Association and in future select their own seed according to the methods recommended by that body.

"From small beginnings," we heard Dr. Robertson say at the annual meeting of the Association recently held in Ottawa, "the Association has grown until in 1913 no fewer than 1054 farms were growing special seed and it is estimated that the results of this better seed will put at least $3,000,000 more into the farmers' pockets the coming fall." He also said "the members of the Association are now growing better strains of grain than the world has ever known before.

The members of the Canadian Seed Growers' Association are today doing the best work that is being done on this Continent for the improvement of seed. It will not cost you anything to co-operate with them and it will mean bigger returns from your various crops. The MARITIME FARMER will be pleased to furnish you with any information you may require along this line. Start right by using good seed this spring and you will have no difficulty in keeping right.

VALUE OF EDUCATION.

It may be rather difficult to estimate the value of education for the farmer. It was not more than a hundred years ago when an education was considered undesirable for anyone who was not intended for one of the so-called learned professions, the ministry, law, or medicine, with an occasional exception in favor of the man or woman who was intended for a literary career. Literature as a profession, apart from the other learned professions, is something comparatively new, however, which accounts for the fact that so many of the great writers of the past have been doctors, lawyers or clergymen, or men who were originally intended for one or the other of those professions.

There was a time when it was not supposed to be necessary for a person to be even well educated in the ordinary acceptation of that term, in order to engage in literary work, certainly not to the extent of having a college education. As for the man in business, or the farmer, the three r's were supposed to be all that was at all desirable; for the farmer a very little of those was considered all that was necessary.

Great is the injury that has been done to the cause of the greatest industry, the most noble profession in the world—agriculture—by the malevolent influence of that anti-education idea. It has kept a great many otherwise sensible and enterprising men from accomplishing the most and best of which they have been capable. It has to a great extent kept the business of farming down to a grade below that of other less important and less elevating occupations. It has made of a great many farmers simply more of the laborers who have been struggling for the bare means of existence rather than supporters of the rest of the world, men and women who have not had the strength of character to rise above their enforced conditions. It has made of many a farmer a sordid, miserly, burden-bearing being, instead of the man he should be, capable of enjoying the finer things of life, capable of pleasure and satisfaction in his labor and appreciation of the good things of the world.

Read Page 439 of the MARITIME FARMER and read about how the campaign for better Agricultural Education for the farmer is progressing in Nova Scotia. Short courses and a continuous system of Institute meetings are being held in Prince Edward Island and much good is resulting therefrom. As we go to press a very successful series of short courses is being completed in the Fisher Vocational School, Woodstock, N. B., and the Dairy and Domestic Science School is opening in Sussex. Before we go to press with our first April issue the Maritime Horse Show will have been held in Amherst. It too is an educational function that you should attend. Remember the dates April 1st to 4th. The Prince Edward Island Horse Show will be held on the 25th and 26th inst.

LEARN TO DO THINGS.

The way to learn to do a thing is to do it. To know the theory of it will help, but after all one learns to walk by walking. The boy who has had a chance to do all manner of work on the farm is in a distinctly better case than the one who has been constantly in school. But the boy who has been to school and has worked hard and successfully on the farm too is happiest, for he can do and do with intelligence. There is a considerable demand for young men to manage farms. There is soon to be great demand for capable young men to undertake the uplift of counties. Assuredly they must have the theories right, but then they must also be able to do. The young man who meets the skeptical farmer in the field and quietly adjusts his defective plow so that it does good work has that man's confidence from then on. The young man who wishes to have the fun of helping in the big agricultural uplift should begin by getting into the game as an effective worker on the best managed farm he can find. There let him study efficiency, his own effciency chiefly. Happy is the boy whose father is a farmer; he can train himself in efficiency on the home acres. It brings out self-reliance and confidence in one's ability to do things.

FOOD FOR THOUGHT.

Some day we will learn that it is just as important for us to see that the child of somebody else is given an education as it is that our own should be trained.

The law that we should love our neighbor is not a Sunday School goody-goody platitude. It has teeth and claws.

We must keep all the children in school all the time, or we must pay the penalty.

We must train the other family's boy, if even only for self protection.—FRANK CRANE.

"I have been watching the career of young men in the city for 30 years and I find that the chief difference between the successful men and the failures lies in the single element of staying power."—THEODORE CUYLER.

"He also that is slothful in his work is brother to him that is a great waster." PROVERBS 18:9.

The farmer needs a discerning eye to tell friend from foe among insects, birds, brutes and men. Nearly all profess friendship for him.

Not much use in buying expensive farm machinery unless you take good care of it. Building sheds is lots cheaper than buying utensils that are rusted out—not worn out.

When a fellow is all wrapped up in himself he usually thinks he's a pretty warm proposition.

Review of Women's Institute Work in New Brunswick

This Branch of the Departmental work is under the regular charge and direct control of Miss Hazel E. Winter, of Fredereiton, who was appointed by the Government, as Supervisor in January 1913. Miss Winter devotes her entire time to the Institutes. The Secretaries send her monthly reports of their meetings and Miss Winter is always willing to assist in preparing programs for the year and to help any member anxious to obtain material in the preparation of a paper.

In June, 1911, two lady speakers were sent out to organize for the first time in the history of New Brunswick, what is known as "Women's Institutes." An organization which has for its object the introduction of higher ideals and nobler sentiments is bound to live, and as a result of New Brunswick's first trial sixteen organizations were formed. During the following months some of these affiliated, (being near together) while others, through lack of a leader, or for other reason, failed to exist, but those living proved to be a power of good to the individual and the community.

Again, in August, 1912, it was deemed advisable to send two more delegates to visit the Institutes already organized, and to assist in forming Societies in other localities where the women of these districts might desire. The field work of these ladies increased the branches in number to twenty-five. These, with the exception of two, have lived, and the field work accomplished last fall has shown that the Women's Institute is an organization that has come to stay. It exercises a beneficial influence upon the individual and the community, especially in rural districts, and although this work is yet in its infancy as compared with Ontario, the work in New Brunswick is rapidly coming to the front and has indeed a very important part to play in the lives of New Brunswick homemakers.

Not until within the last year has it been possible to obtain much money from the Government for Institute work. Being a new Society, they were somewhat afraid it might not succeed, but after being shown what ambitious and intelligent women are in the Province of New Brunswick, the Government readily set aside a substantial sum and the Department of Agriculture was then in a better position to aid the women in this noble work. A Grant of Five Dollars was given to each Branch having a paid-up membership of at least fifteen, and all Branches were provided with Minute Books, Report Forms, Hand Books and literature sent out from the Department.

Last February a Convention was held at Fredericton, which resulted in a large gathering of women from every part of the Province. The Convention was a success in every sense of the word, and the women were eager to return to their respective localities and tell their fellow-workers how the local Institute could be made a greater influence for good. Preparations are now being made for the second Annual Convention, to be again held at the Capital, in June. The members have increased so in numbers, that a much larger attendance is expected this year.

The months of September, October and November of 1913 were devoted to field work. It is a recognized fact that more good can be done by visiting the different Institutes than in any other way, and it has become a custom for lady lecturers to be sent

Miss Hazel Winter

Supervisor of Women's Institute for New Brunswick. A leader in the "For Home and County" Movement.

out once a year to visit the many localities where Institites are in existence. Four ladies, including an organizer, lecturer, demonstrator in Household Science and demonstrator in Home Nursing were sent out, at the time above mentioned, visiting in all fifty-one places and effecting organizations at eighteen new places. There are at the present time, forty-one Branches of Women's Institutes in New Brunswick, with a membership of one thousand.

Last September, at the Fredericton Exhibition, four rooms, comprising Model Kitchen, Dining-room, Bedroom and Ladies' Rest Room were provided for the Women's Institutes Demonstrations were given each day along nursing and cooking lines, which members as well as visitors were much benefited by. It is the intention of the Department to have a Ladies' Rest Room at the St. John Exhibition this fall.

Bulletins have been printed and distributed among the members on,—"Making Homes Attractive," "Valuable Hints on Nursing," "Uses of Fruits in the Household," and "Children." During the year more are to be printed along lines of special interest to all homemakers.

It was also the intention of the Department to spend part of the funds on a Travelling Library, but afterwards it was decided to make a present of six books to each Branch and to pay half the price on all books bought by the different Branches, thus encouraging them to start a Library of their own. These books are to be given to the delegates representing the different Institutes at the Convention in June.

The Department of Agriculture is giving and is prepared to give special attention to the developing and extending of Women's Institute work. The work has grown steadily since its organization. The subjects taken up at the meeting are such as bear directly upon the every dav activities of the women and cannot but be of great assistance to those who take advantage of these meetings.

The following is a programme mapped out by the Upper Keswick and Scotch Lake Branch of the New Brunswick Women's Institute. It will give one an idea of the range of subjects dealt with:—

January:—Resolved that 1914 be the best year yet; Care of Child during firstyear, Mrs. E. Jewett; Invalid Cookery, Mrs. H. Jewett.

February:—How to put out a fire, All; Remedies for Scalds and Burns, All.

March:—Window Box Plants, Mrs. H. Sargent; The value of keeping Household Accounts, Mrs. Robertson; The disease "Rheumatism" discussed, Dr. Robertson.

April:—Governing of New Brunswick; our advantages living in New Brunswick, Mr. Wm. Moore; Systematic Housecleaning.

May:—Fly Peril; Prevention of Moths, Mrs. F. Coburn; Beautifying of Highways, All.

June:—Noted Women of Canada, Mrs. Robertson; Sweeping and Dusting; Care of Lamps, Mrs. F. Gordon.

July:—Simple desserts for warm weather, Mrs. C. Sloat; Defects in Buttermaking, Mrs. Wm. Coburn.

August:—Picnic.

September:—The relation of the parent to the public school, Miss N. Moore; Canning of peas, beans, tomatoes, etc., All.

October:—Poultry Hints, All; Demonstration, Pumpkin Pie, Mrs. H. Jewett; Good Books that we should read, All.

November:—Cooking without eggs, Mrs. G. Hagerman; The 20th Century Farmer's Wife, Mrs. J. Jewett.

December:—Simple meals, well cooked and nicely served, their refining influence, Mrs. Jackson; Infectious Diseases, Dr. Robertson.

One may ask the question, "In what way have the communities where organizations have been formed been benefited by the Women's Institute?" Ans.—Circulating Libraries; building and repairing Public Halls as well as furnishing them; suppressing the sale of cigarettes and tobacco to minors; improving parks and schools; planting of trees; giving prizes to schools for nicely kept gardens; presenting the schools with flags, drinking cups, etc., providing fountains, lights, side-walks and last but not least, erecting a band-stand for the town.

"The Institute is for women what the public school is to the nation. All denominations and classes meet together and they are one. Class, social position, wealth, religion, are all swept aside, and each one must find her own level and each one must be taken on her own merits." The Institute is not for the amusement of a select few; it is a strong, live, active organization, and every woman and girl, whether in village, town or city, should be brought under its beneficial influence.

Mothers and daughters who are not members of this grand body of women, should make a special effort to get in touch with Secretaries near their homes and become members. Mothers and daughters who live too far away from a Women's Institute to join, but are eager to belong to an organization which stands for all that is noble and high and good, should communicate with Miss Winter, the Supervisor, who will be only too glad to go to their locality with the view of organizing a Branch which has for its motto, "Home and Country."

FERTILIZER ANALYSIS

Editor The Maritime Farmer:—

In buying fertilizer the object is to obtain actual plant food. It is not sufficient to purchase merely fertilizer or even Jones' Bumper Crop Produce or Smith's Potato Grower since all mixtures contain plant food in varying quantities. The analysis should be the factor influencing the choice of fertilizer. By selecting a fertilizer according to the analysis the most economical and efficient one for the crop and soil intended can more easily be chosen.

The fertilizer act requires that every package, bag, barrel, etc., of fertilizer should carry a statement of the analysis of the fertilizer contained giving the percentage of plant food therein. This applies to the separate ingredients as well as to the complete fertilizers which contain the three plant food essentials, nitrogen, phosphoric acid, and potash.

The following is an example of a statement of analysis is found on a bag of fertilizers.

Niteogen	2.47 to 5.29 p.c.
Equal to Ammonia ...	3.00 to 4.00 p.c.
Soluble Phosphoric Acid	6.00 to 7.00 p.c.
Reverted	2.00 to 3.00 p.c.
Available	8.00 to 10.00 p.c.
Insoluble	1.00 to 2.00 p.c.
Total	9.00 to 12.00 p.c.
Actual Potash	3.00 to 4.00 p.c.
Equal to Sulphate of Potash	5.55 to 7.40 p.c.

The analysis as published by the various manufacturers differ. Some use a long complicated statement as the above while others have simplified their statements to little more than the essentials. All that is of value in the fertilizes analysis is as follows:

Available Phosphoric Acid .....p. c.
Nitrogen .... p. c.
Actual Potash .... p. c.

It should be noted, however, that some manufacturers express the nitrogen only as "equal to ammonia." The only value of the ammonia is the nitrogen contained. It should be remembered that when the nitrogen is expressed as equal to ammonia the percentage reads a little higher though actually of the same value.

In the above, two percentages are given lowest and the possible highest Since the manufacturer is responsible only for the percentages of plant food as expressed in the first column only those percentages need be considered.

Each fertilizer manufacturer puts out a number of different mixtures varying in the plant food content. In a general way these can be grouped as low grade, medium grade and high grade mixtures. These terms are in no way indicative of the availability of the plant food content nor of the quality of the ingredients used but refer only to the percentage of plant food contained.

The following would be examples:—

Grade	Per cent. Nitrogen	Per cent. Available Phos. Acid	Per cent. Actual Potash
Low	1.5	7	3
Medium..	2.0	8	5
High.....	3.25	8	10

The high grade mixtures are the cheapest. Necessarily they cost more per ton, but the cost of the actual plant food per pound is less. This is easily understood since the cost of actual mixing, bagging, freighting, and selling is the same in all cases. This makes the cost of all mixed fertilizers the same up to a certain point. The difference in the price of the different brands, then, is due to the different amounts of plant food contained. With a high grade fertili-

be put into a pail of lukewarm water.

Next, tear the paunch loose at the spleen, and then pull the large intestine downward being careful to leave all the fat possible and also be careful not to loosen the kidney fat. It will be necessary to loosen the viscera just back of the pancreas with a knife and then loosen the liver and pull the viscera forward and cut the gullet below the stomach. It is much safer for a beginner to remove the liver with the stomach and intestines and detach it from the remainder of the viscera after they have been taken from the carcass. Remove the gall bladder from the liver and examine the liver thoroughly for parasites. If it is healthy it should be put in a pail of cold water so that it will cool out quickly.

Fig. 9. The Caul Fat.
(A) Caul Fat Not Wrapped About Hind Legs.
(B) Wrapped About the Hind Legs as Usual in Case of Lambs.

To remove the pluck, cut around the inner edge of the muscle of the diaphragm leaving the hanging tenloin, the thick muscle that supports the diaphragm, on the carcass. Then cut across the large blood vessel and loosen it from the backbone and the pluck can be pulled out.

Wipe blood stains from the inside of the carcass with a dry cloth and see that the bottom of the chest cavity is open to allow any blood to drain out. Never wash the inside of the carcass, unless it has become badly soiled and then be sure to dry it thoroughly.

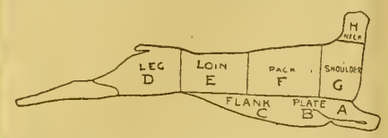

Fig .11. Side of Mutton Showing Main Divisions

(A) Front Leg	(E) Loin
(B) Plate	(F) Rack
(C) Flank	(G) Shoulder
(D) Leg of Mutton	(H) Neck

See that the bladder has not been missed in removing the viscera. Wipe the carcass thoroughly, then, it is a lamb or a yearling wether, attach the caul fat to the hind legs and flank, wrapping the heavy end of the fat around the hind legs, spreading the thin end over the flank and cutting a few holes in the caul to aid in cooling the carcass as shown in Figure 9, B. The caul fat is not put on mature sheep carcasses, bnt they are left plain as shown in Figure 10. Fold back the legs and fasten them to the shank with a skewer or a clean nail. Folding the front legs gives the carcass a thicker and neater appearance. Ordinarily a sheep's carcass is opened as just described but it will cool out more quickly if it is split part way to the breastbone and a spreader put in to hold it open. In warm weather it is a good policy to split the carcass in halves so as to allow it to cool more quickly. Any dry, clean, cool place is suitable for hanging the carcass until it is cool, but any bad odors should be avoided as they are rapidly absorbed. If the carcass is to be sent to a local butcher it should be kept clean and fresh in appearance perhaps by wrapping in cheap white muslin which will keep it clean and prevent it from becoming fly blown, at a slight extra expense.

Fig. 10. A Fancy Mutton Carcass

Fig. 12. The Front Leg.

CUTTING THE CARCASS

The sheep carcass is the easiest of all carcasses to prepare for the table as each main division yields roasts and stews right in size for the average family without further subdivision. This holds true of all cuts of mutton with the exception of those which may be used for chops. For instance, the round or beef is divided into rump, round steak, pot roast, and shank, and some of these divisions have to be subdivided to make cuts that are ready for the table, while the leg of mutton, which corresponds to the round of beef is nearly always used whole for roasting.

The tools necessary for cutting mutton are a meat saw and a sharp knife. A solid bench or block should also be provided.

Two general rules may be given for cutting any kind of carcass: (1) Always cut across the grain of the meat and (2) separate the thinner from the thicker parts of the carcass. Always try to make clean, smooth cuts and to leave as few ragged edges on the meat as possible because these ragged edges are more or less wasted in cooking. The method of cutting will depend to a certain extent upon the class of trade or the size of the family that is consuming the meat, but in general the following method has proved very satisfactory. No matter how good the method, however, neat cuts cannot be obtained unless one is interested in the work and does it carefully.

A sheep carcass is not ordinarily split before cutting it when it is intended for home use, it is best to split it and cut from each half as needed, for by this method there is less surface exposed, the meat keeps much better and there is less waste by evaporation.

The mutton carcass is divided into the general cuts shown in Figure 11.

The method of removing these follows:

The Flank, Plate, and Front Leg—The flank, plate, and front leg may be removed by starting with the udder or cod and cutting out straight to the edge of the flank, just deep enough to expose the large gland that lies in the flank region. Then cut forward to the end of the last rib and continue to cut forward to a point just above the elbow, taking the front leg, plate, and flank off together. Then cut the front leg from the plate. If the caracss is thin this cut should be made higher upon the ribs than mentioned above.

The Leg.—The leg of mutton is ordinarily cut off at the point where the first sacral vertebra begins, that is, where the spinal column bends upward to form the pelvic arch. If a small leg of mutton is wanted, cut farther back, and if a large leg is wanted, cut farther forward.

The Shoulder.—The shoulder is removed by cutting between the third and fourth ribs. This cut may be made longer or shorter, but if made as above, a shoulder of convenient size is obtained and very little of the shoulder blade is left on the rack. The neck is removed by turning the shoulder front side downward and cutting the neck off squarely level with the back. This leaves a square shoulder.

The Loin, Rack, and Kidney Fat—The loin, rack, and kidney fat make up the middle piece. The back part of this piece, including one rib, constitutes the loin, and the front part, the rack. The kidney fat should be pulled from the loin, but enough should be left on the loin for roasts and chops.

TRIMMING AND USES OF SHEEP CUTS

The Front Leg—The front leg, or the front shank, as it is also called, is a tough piece of meat that contains a large percentage of bone. It is used altogether for broths and stews. The leg bone Figure 12, A, is removed at the knee and the shank, is cut into three or four pieces as shown in Figure 12, B. Always use a saw when cutting this bone because round bones will shatter when cut with an axe or cleaver and the small pieces of bones are very objectionable even in broths or stews. This is a comparatively cheap piece of meat.

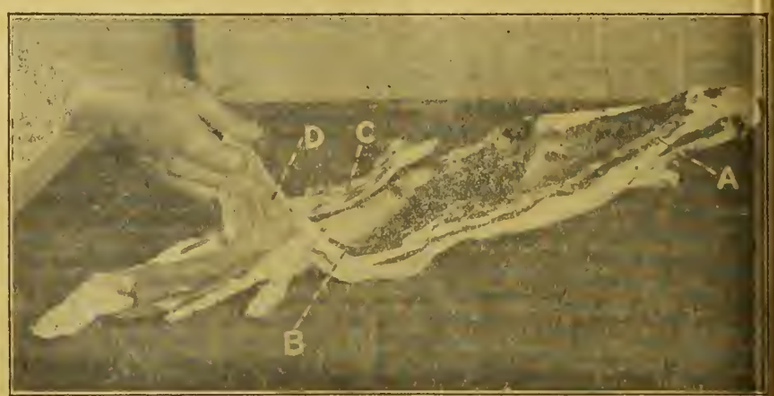

Fig. 13. (A) The Plate (B) Flank

The Flank and Plate.—The flank and plate are ordinarily cut up into small pieces and used for stews. The plate of the lamb is very often called the breast and this cut is used for a pocket of lamb. In trimming the flank and plate, cut a narrow strip, Figure 13, C, along the inside edge from the udder to the breastbone. Then the thin tough membrance should be pulled from the inside of the flank. To do this, start just back of the diaphragm at the breastbone and pull back the membrance until a heavier, whiter membrane is reached. Cut across this membrane and pull it off as illustrated in Figure 13, D. This thin membrane is tough and removing it improves the quality of the stew. If the plate and flank are to be used for stews they should be cut up into small squares. The pocket of lamb is made from the breast or brisket end of the plate by parting the muscles so as to form a pocket to hold dressing. The plate and flank make one of the very best pieces to use for stew. It is one of our cheapesr and most economical cuts of meat for which the demand is

Fig. 14. The Leg of Mutton as Removed from the Carcass

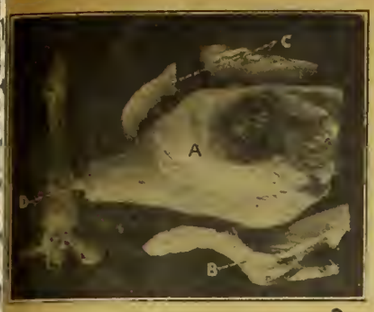

Fig. 15. French Leg of Mutton, Illustrating Method of Trimming.

unsteady. Consequently there are times when this cut can be bought very cheaply, especially at markets that have a heavy chop and roast trade.

The Leg of Mutton.—The leg of mutton is one of the most popular cuts of the sheep carcass as it is thick and meaty. It is largely used for roasting, though it is also sought for boiling purposes and for steak. The steaks should be cut from the loin end or front of the leg. In case a leg of mutton makes too large a roast for the family, a few steaks may be cut from it. In this way a leg of mutton can be used to better advantage than if the whole leg were roasted. A leg from an old, thin animal should be boiled rather than roasted.

While the leg of mutton is one of the high-priced cuts for which there

Fig. 16. A Plain or American Trimmed Leg of Mutton

is a rather steady demand, in economy it compares favorably with some of the cheaper cuts owing to the relatively small percentage of bone in a trimmed leg.

The leg of mutton as it is cut from the carcass has some of the thin flank muscles, the tail bone, and the shank attached to it. These should be trimmed off before cooking. The leg is trimmed to make two different styles of roast. The French-trimmed leg of mutton is shown in Figure 15, A, and the American or plain-trimmed leg of mutton in Figure 16, the difference being altogether in the way the shank end of the leg is trimmed.

In trimming the body of a leg of mutton, start just back of the cod or udder, trimming off the soiled and surplus fat and continue this cut around to the flank, taking off the

Fig. 17. Removing the Fell from a French-Trimmed leg of Mutton

thin part of the flank as shown in Figure 15, B, then trim around on the other side taking off part of the tail bone as shown in Figure 15, C. Trim off any loose end or soiled part that may be left in the leg, making it neat and round in appearance but be careful not to expose or cut into the lean meat as it will shrink more in cooking and the roast will be less juicy than if the lean muscle is left covered.

To make a French-trimmed leg of mutton cut around the leg where the large tendon enters the muscle just above the hock. Scrape back the flesh clean from the bone and saw off the shank leaving the bone projecting half or three-quarters of an inch as shown in Figure 15, D. This bone serves as a handle to aid the carver.

The American or plain-trimmed leg of mutton is made by unjointing the stifle and cutting out the bone as shown in Figure 16, A. The piece of meat left hanging is then skewered over the joint. To unjoint the stifle cut about a half or three-quarters of an inch in front of the bony projection just below the stifle The French method gives a trimmer and neater roast. The sheep carcass is covered by a thin membrane or fell which may be removed from the leg of mutton if there is any reason to believe that it is tainted. Begin at the front end of the leg and pull the fell backward, being careful not to tear the fat, as shown in Figure 17. While this removes the possibility of taint the roast will shrink slightly more in cooking, especially if it is not very fat.

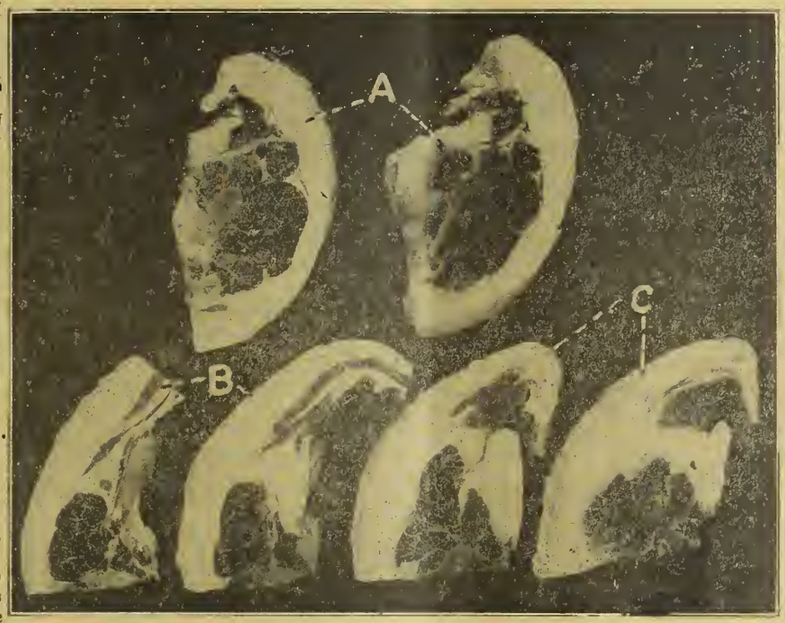

Fig. 19. Loin Chops.

The Loin.—The loin is usually the highest priced cut of the sheep carcass for the reason that it is a tender piece of meat and because it is cut into the best chops and it is also makes one of the best roasts. The loin can always be recognized by the tenderloin, Figure 18, A, which is the small muscle located underneath the spinous processes, in this region. There is very little trimming to be done on the loin. To prepare this cut for roasting cut it in suitable pieces, then cut through the joints along the backbone to aid in carving the meat after it is cooked, being careful not to cut deeply into the flesh as this exposes the lean muscle, causing more waste in cooking and making the roast less juicy.

If the loin is cut for chops the thickness of the chops will depend upon the taste of the people using them, but good chops should not be cut less than three-quarters of an inch thick. The loin chops vary in quality and appearance as can readily be seen in Figure 19. The chops that are cut from the rear end, Figure 19, A, and the rib end of the loin, Figure 19, B, are not as good as the chops cut from the center of the loin, Figure 19, C, owing to the fact that they have more tough muscle and there is less of the tenderloin in them. To make chops of the very best quality, the fell should be removed as shown in Figure 20.

The Rack or Rib.—The rack or rib is used for the same purpose as the loin. Some people prefer the loin while others prefer the rib. As a roast the rib is used either as a plain rib roast, Figure 21, or as a crown roast or coronet, Figure 22. To prepare for roasting, cut through the joints along the backbone and once across the rib. Whenever conditions will permit, it is a good plan to cut off the lower, thinner part of the ribs and use them for stew. The remaining piece makes a neater roast of better quality than the whole rib.

The crown or coronet is made by rolling back the flesh from the lower end of the ribs. The joints in the backbone are opened and the rib is bent backwards and the ends tied or skewered together as is shown in Figure 22.

Rib Chops.—Rib chops are ordinarily cut one chop to each rib but if this makes too thick a chop to suit the taste, one chop may be cut with the rib and one between theribs. However, chops cut this way are too thin to make a high-class, juicy chop The chops that are cut from the tenth, eleventh, and twelth rib, Figure 23, A, are the best, as the lean part of the meat is composed of one big tender muscle, while those that are cut near the shoulder, Figure 23, B, contain more muscles which are inclined to be tougher than the chops mentioned above. From the standpoint of amount of lean meat obtained, however, the chops cut from the shoulder end of the rib are more economical than those cut from the loin end. The fell should be removed from these chops the same as from the loin chops. The French chop, Figure 23, C, is made from the rib chop by cutting away the meat about an inch from the end of the rib. This gives a neat appearance and the rib serves as a handle, which is often decorated after it is cooked. Rib chops are often boned, rolled, and held together with a small

Fig. 18. The Loin
(A) The Tenderloin

skewer. These are known as rolled chops. Ordinarily, it is the thinner chops that are treated in this way.

The Shoulder.—This cut of a sheep carcass may be rightfully called a handy piece of meat for it may be roasted, stewed, or cut into steaks, depending upon the ability of the cook to handle this comparatively cheap cut of the sheep carcass. A good lamb or mutton shoulder of good quality, such as that shown in Figure 25, makes a very good roast though it is harder to carve than a leg of mutton on account of the many

Fig. 20. Method of Removing the Fell from a Chop

small muscles and the arrangement of the bone. However, the shoulder may be boned before cooking to obviate this inconvenience. If used for a roast all the soiled and bloody parts should be trimmed off. The ribs should be sawed across once and the backbone should be unjointed with a cleaver.

Two kinds of steak are cut from the shoulder, the shoulder blade steak, shown at A, in Figure 25, which is cut with the rib and the shoulder or arm steak, shown at D, cut across the lower part of the

HORTICULTURE.

Fertilization of Orchards.

Editor The Maritime Farmer:—

The fertility needs of an orchard may be the most important check on its prodcction.

In general the characteristics of an orchard that needs fertilizer are those of starvation.

They are found most commonly in the older orchards, especially in those that have once borne well but are no longer doing so, although still fairly free from diseases or improper drainage. The foliage is sparse and pale green in such orchards, and the annual growth stops early and is short, often not over an inch or so long. In such orchards one can apply fertilizers rather liberally with confidence of profits providing other conditions are right. Under opposite conditions such as obtain in some young orchards or in any orchard that is making rapid growth and retaining its foliage late in the season fertilization is less likely to show a profit.

The best method of application is merely to scatter the fertilizer or manure broadcast over the surface of the ground, taking care not to get it too close to the tree trunks, where there are few feeding roots and extending the applications well out beyond the spread of the branches, but by examination it will be found that the feeding roots of an orchard from fifteen years old and upward extend over the whole surface even when the trees are 33 feet apart. This fertilization is usually harrowed in with cutaway harrows. With this done it should be remembered that the fertilizer applied in any given season can hardly materially affect the yeild of that year. Since the fruit buds are formed in the latter part of the preceding season, important results therefore should not be expected before the following season, at the earliest.

It has been stated on good authority that there is still in the average soil enough dormant plant food to supply the trees for long periods of time to come. Yet in actual practice we have never been able to break it up sufficiently fast to supply the actual demands of the trees for plant food. It is, therefore, very important that once a year fertilizers in various forms and humus in barn manures or cover crops be added that the young trees may have a liberal amount of food that they need to supply bud formation, wood, leaves, roots and fruit.

The total plant food draft of a mature and active orchard is greater than a 25 bushel crop of wheat in every important constituent except phosphorus. It is practically inevetible, therefore, that soooer or later the output will be reduced in any productive orchard because of lack of sufficient plant food.

The mineral requirements of wood are comparatively low. This largely accounts for the fact that young trees do not make a profitable response to fertilizer applications, although they respond to manure or methods of conserving moisture.

The relative amounts of the various food elements required by the other parts of the apple tree are also of interest, but as a whole they are not reliable for making fertilizer applications. The latter is best determined by experiment.

The application of nitrogen and phosphates and also of manure have been very beneficial in the orchards under my immediate care. In my orchards potash does not seem to be of much service but in some soils the use of potash is very important. The time required for results to appear are generally short where fertilizers were really needed not later than the middle of the second season.

Phosphoric acid when applied alone does not seem of much benefit but when nitrogen is added then results are plainly visible.

Basic Slag is now being used on orchards in the Annapolis Valley with profitable results in most orchards. Large applications of Muriate of Potash have been used and the slag containing free lime tends to neutralize the acids in the soil left by the use of Muriate. The lime also helps the growth of leguminous intercrops.

High grade Sulphate of Potash does not by experiment show any superiority over Muriate as a carrier of Potash. The low grade Sulphate may be superior on account of its magnesia content, but this is not positively known.

The influence of proper fertilization is not transcient. The gains from it seem to be greater as the years go by and when the crops of full years are not too high the yields have usually been greatly steadied by proper fertilization.

In using barn manure the action has proved to be as good as commercial fertilizers rich in nitrogen and phosphoric acid.

The application of ground fish and slag has proved a good fertilizer on my orchard.

As a rule, the influences that have materially increased the yields of fruit have also increased the growth of wood.

There does not seem to be anything in fertilizers to determine the size of the fruit. The size of the crop on the tree determines the size of the fruit. Proper trimming and moisture conditions are the important means of increasing the average size of the fruit.

The red color of apples cannot be increased materially by the kind of fertilizer applications though potash and phosphates may be of some slight assistance. These colors are directly dependent on sunlight and maturity, with the latter occuring preferably on the tree. Late picking, open pruning, light soils, sod culture and mildly injurious sprays tend to increase the red color of fruits, while thick trees, early picking, clay soils, excessive culture and over fertilization with nitrogen tend to opposite results.

From our experience of thirty years in orchard fertilization it would appear that the fertilization of a given orchard is still largely a local problem.

As a result of using fertilizers for a long period, I would recommend per acre, the following:

Nitrate of Soda ....100 lbs
Fish Fertilizer ....200 lbs
Basic Slag or Acid Phosphate 500 lbs
Muriate of Potash ....150 lbs

To the above fertilizers the cover crop of vetches or clover will be ploughed under in the autumn, which will add more plant food and give the humus needed. If you would keep up the soil fertility the supply of humus must be overlooked; it is the most important problem confronting the orchardist of the present day.

Great results have been obtained with nitrogen and cover crops alone on some soils.

The amount of manure per acre varies with the condition of the soil but twelve tons per acre is considered a liberal dreesing. The time of application, we believe, to be of distinct importance, especially in the case of nitrates. There are good indications that nitrates can easily be applied too early in the season and thus be wholly lost to the trees. From our experience, we feel that nitrates should not be applied earlier than petal fall in apples and not later than the middle of July. In using nitrate of soda two applications are better than one as this fertilizer is so easily dissolved and is in danger of being washed over by rains. An incidental advantage of the delayed applications appears in the fact that it gives an opportunity to vary the rate somewhat in accordance with the size of the crop set on the trees. When the crop is light much smaller applications are required because of the natural tendency of the trees to develop a sufficient number of fruit buds in the off season. In the full year on the other hand the applications should be rather liberal in order to prevent the total abstinence of a crop the following year and in the long run to steady the yields.

In the case of the mineral fertilizers with their slower solubility and slower action the time of application is less important. Some orchardists apply these fertilizers in the fall with good results. We feel that the time of application of mineral fertilizers is not of much importance as they are quickly fixed in the soil. Manure can be applied at any time except in late summer, which is never done.

In the use of fertilizers in my orchards, I am of opinion that the liberal fertilization pays best. The plant food is not all used up the season it is applied and as it is fixed in the soil it is not lost and an orchard where a regular application of fertilizers is made the crop increases as the years go by. It is poor policy that, because the prospect of a crop is not promising, that the supply of fertilizer should be withdrawn. Steady and regular feeding of an orchard results in profit and is as sensible as the steady and regular feeding of a horse.—W. H. Woodworth, Berwick, N. S.

The Brown Tail Moth Situation.

Editor The "Maritime Farmer,"

I shouldbe pleased if you would permit me to call the attention of your readers to the Brown-tail Moth situation in the Province. The serious character af this insect as a pest of fruit and shade trees, and as a

Eureka Potato Planter

Catalog sent free

No matter whether you grow large or small quantities of potatoes we have a size of planter that is just what you need. The Eureka line of Potato Planters is the largest manufactured. This machine takes only *one* man to operate it. That means less trouble and expense for *you*.

Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if desired) —covers up—marks for next row.

It's an easy machine to operate. The steel and malleable iron construction mean lightest possible weight and increased life of machine. Your repair bill will be practically nothing. Plants uniform depth at *all* times because plow is directly under the axle. Dropping mechanism in plain view of driver. Does not injure seed.

We supply planters in three sizes, for one or two rows—with or without Fertilizer Attachment.

For 15 years the Eureka Potato Planter has been successfully used throughout the world.

We also make Eureka Potato Cutters and the Eureka Mulcher and Seeder—a mulcher, smoothing harrow, cultivator, weeder, seeder.

cause of physical discomfort and possible illness, owing to the poisonous nature of the hairs of the caterpillar, needs no emphazing, as most of your readers will be acquaninted with the experiences of the New England States in regard to this insect and the Gypsy Moth.

The Dominion and Provincial Departments of Agriculture are making every possible effort to keep the insect in check by collecting the winter webs or nests on the trees, each of which webs contains on the average about 250 young caterpillars. On this work a body of ten inspectors employed by the Dominion and Provincial Governments, is engaged, and they are covering the whole of the infested territory. Owing to the enormous flight of moths which were blown across the Bay of Fundy irom Maine in July, 1913, the infestation has been very greatly increased. With the annual increase of the infestation in Maine we may expect a recurrence of such a re-infestation by wind-carried female moths in the future, and it is therefore more than ever necessary to call the attention of the owners of orchards and trees to the requirements of the law in this regard.

Regulation 8 of the Dominion "Destructive Insect and Pest Act" states:

"Any inspector entering any lands nursery or other premises where there is reason to believe that any of the insects, pests or diseases hereinafter specified or may be present, shall give instruction for the treatment or destruction of any tree, bush, crop or other vegetation or vegetable matter or the containers thereof, which may be found or suspected to be infested with any of the insects, pests or diseases hereinafter specified, and such instructions shall be carried out by the owner or lessee of the infected or suspected vegetation, vegetable matter or containers thereof, and such remedial treatment shall be carried out and continued until the insect, pest or disease shall be deemed by the inspector to have been exterminated."

The penalty for contravention of the regulations under the Act upon summary conviction is a fine not exceeding one hundred dollars or imprisonment for six months, or both fine and imprisonment.

The conditions in the Province are such as to demand the strict observance of this law. While the respective Governments are leaving no stone unturned, the duties of their officers are to inspect, and the fact that they are collecting the webs on infested premises does not relieve the owners of such premises of the necessity of conforming with the aforementioned regulation and taking steps to eradicate the Brown-tail Moth when the same occurs in their premises.

Orders have been issued to the inspectors to instruct the owners of properties on which the Brown-tail Moth has been found in any abundance to spray their trees thoroughly with a spray solution containing not less than two pounds of arsenate of lead (the arsenate of lead is to contain not less than 15 per cent. of arsenic oxide) to every forty gallons of water after the leaves appear and before the blossoming of the trees. This spraying is to be carried out in a satisfactory manner, and all cases in which the instructions have not been carried out will be reported by our officers in charge to the Department.

Those fruit growers who are accustomed to spray thoroughly and at the proper time need fear no defoliation or trouble, but it is to their interests to co-operate with the Dominion and Provincial Departments of Agriculture in seeing that the less progressive persons carry out the necessary requirements.

Yours faithfully,
C. GORDON HEWITT,
Dominion Entomologist.
Department of Agriculture, Ottawa.

Amatite

The Roofing that Needs No Painting

WHEN your roof is covered with Amatite, there is an end to the roof painting nuisance. Amatite has a real mineral surface and needs no painting.

The mineral surface makes painting unnecessary and it will stand rain and hail and wind and snow, for years, without attention.

When you paint the old-fashioned roofings you are practically trying to keep them from getting wet. Amatite is made to get wet, for water won't hurt it a bit. Next time your old-fashioned roofs need painting, cover them with Amatite instead.

A sample of Amatite and booklet about it will be sent on request. Address nearest office.

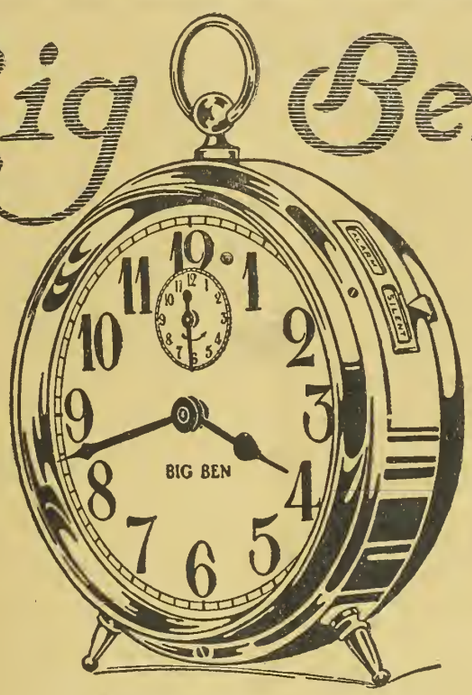
Big Ben



8,760 Hours On a Drop of Oil

7,000 Canadian dealers say that Big Ben does *more efficient work* for less pay than any other clock built. He's a regular glutton for good work.

In return for one little drop of oil Big Ben will work for you a full year. From "Boots on" to Lights out"—365 times—he'll guarantee to tell you the time o'day with on-the-dot accuracy. He has made the same guarantee over 3,000,000 times and made good every time. He'll make good for you. More than $8,000,000 has passed over good dealers' counters for Big Ben and his brothers.

A Big Ben battalion, over 3,000 strong, leaves La Salle, Illinois every day. Every one of them feels proud of his triple nickel-plated coat of implement steel; his dominating seven-inch height; his large, bold figures and hands, and his big, easy to-wind keys. No other clock can match their looks and ability to serve.

Things move with a will when timed with Big Ben. He'll wake you *gradually* by ringing every other half-minute for ten minutes or rout you out in a hurry with one long musical ring. Suit yourself how he does it. You can shut him off short in the middle of his call, if you wish.

He is built in a live town for live wires. And his best work has been on the farm. Before-breakfast chores are started *right on time* when Big Ben time is set. *He never oversleeps.* He runs on time, rings on time and stays on time.

If your dealer doesn't sell Big Ben, send a money order for $3.00 to his makers—*Westclox, La Salle, Illinois.* He will come to your house by express duty charges prepaid.

DAIRYING.

Cost of Milk Production.

Editor Maritime Farmer:—

In these times when the dairy farmer is facing the high costs of foodstuffs and labour and the proportionately low values of his milk, it is necessary that he should strike a careful balance between costs of production and gross returns. Only by such a step can he eliminate the unprofitable cows or methods in order to cheapen the gross costs.

The following tables are submitted from data gathered from the Experimental Farm system and careful calculations made from the same. Table 2 is an estimate balance sheet, which cannot be absolute and may be remodelled slightly to suit more closely the different conditions in the Maritime Provinces. Table 1, the actual production sheet, is correct, and warrants the estimate of cost of feed for production as in table 2.

PURE MILK.

It mustbe carefully noted that this is for the production of pure milk, not necessarily certified milk. This means a good, wholesome milk that is clean and has good keeping qualities. The average milk in Eastern Canada is not such, nor could it be where such a high percentage of the barns and cattle are dirty, barns dark and not ventilated, and the milking conducted in dusty and dirty stalls by attendants wearing dusty and dirty clothes, and with dirty hands; to say nothing of many of the utensils being either dusty or ill sterilized.

CREDIT TO COW

1:	Value on her milk at $1.00 per cwt.	57.27
2:	...Chemical value of manure, 10 tons in 300 days @2.25	22.50
3.	Humus value of manure (300 days)	22.50
4.	1 Grade calf yearly	5.00
5.	Bedding not calculated as it is worth its average estimate as manure	
	Total credit per year	107.27
	Profit not considering mortality and other risks per cow	5.16

VALUATION OF MILK

Milk is often estimated at $2.00 per cwt., but to suit Maritime conditions it might be set at $1.00 per cwt., which is about what is paid by cheese factories. Nevertheless this does not strike a fair average, for milk suppliers to the cities undoubtedly get more than this valuation, which as you will see amounts to only 10 cents per gallon, or 2½ cents per quart. You are at liberty to change this to suit your individual condition. In table 1, milk was valued on a butter basis, in which butter sold for from 26 to 30 cents per pound.

VALUATION OF FEEDS

Table 1 is compiled from the following valuations of foodstuffs:—

Hay	$7.00 per ton
Green feed	3.00 per ton
Roots and corn ensilage	2.00 per ton
Meals and grains	$20 to $25 per ton

Note particularly that pasture on the Central Experimental Farm, Ottawa, is very limited, which undoubtedly increases the cost af production during the summer months. Roughly speaking, there is no more than one month's pasture for the dairy cows. Hence tne somewhat high cost of foodstuffs per annum.

AVERAGE OF PRODUCTION OF MILK
CENERAL EXPERIMENTAL FARM, OTTAWA
1805 to 1913.

Breeds—all ages	No. of Years	Days in Milk	Lbs. Milk	% Fat	Cost of Feed	Cost of 100 lbs. Milk.	Profit on Cow above feed
Average 3 best Canadians	8	303	6,871	4.54	50.53	74.	54.41
Average 3 best Ayrshires	8	317	8,887	3.94	57.30	64.6	64.11
Average 3 best Guernseys	8	322	6,167	4.93	49.43	82.6	52.03
Average 3 best Shorthorns	6	300	6,454	3.9	50.44	80.	30.73
Average 3 best Holsteins	1	429	14,125	3.48	84.41	60.8	115.81
Average 3 best Grades (Ayrshires and Guernsey)	6	310	6,655	4.66	52.63	76.5	47.54
Average 368 Lactations (all breeds and grades)	8	280	5.565	4 26	45.99	87.	34.41

TOTAL ESTIMATED EXPENSES BASED ON AN AVERAGE GOOD GRADE HERD OF 24 COWS, AND PRODUCING PURE MILK (NOT CERTIFIED).

1.	Cost of feed for cow producing 5.727 lbs. milk	52.21
2'	Barn for housing cows and feed (45.00 per cow) Interest,taxes and depreciation, repairs, insurance, etc. 10 per cent.	4.50
3.	Value of cow (65.00 per grade cow) Interest @ 6 per cent	3.90
	Depreciation @ 10 per cent	6.50
4.	Value of tools, dairy implements, etc., per cow (5.00) Interest and depreciation on same @ 10 per cent	.50
5.	Value of brushes, aprons, towels, ice, record sheets, soap, veterinary supplies etc	1.00
6:	Cost of pure bred bull per cow (including 6 per cent int. of $150. and maintenance)	3.00
7.	Care of cow and milk for year, Men at 16c. per hour	30.50
	Total cost per year	$102.11
	or total cost per 100 lbs. milk	1.78

VALUATION OF BRAN.

This valuation of $45.00 per cow on a good fair dairy barn is all too conservative, but you can remodel this to suit your individual conditions. It is doubtful if many Maritime Province dairy farmers at the present time could begin to build a good dairy barn for this sum or even 50 per cent more.

VALUATION OF COW.

Probably the average cow of the above type, on the market, is worth a little more than $65.00 per head, but I am informed by authorities that good cows, producing as above, can be purchased on an average for this valuation, namely, $65.00.

VALUATION OF LABOUR

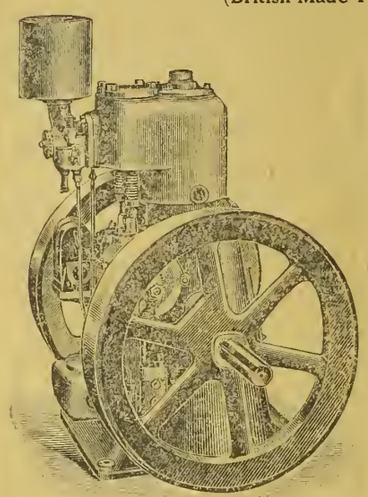
Here is an item that demands your full consideration. The average farmer in the Maritime Provinces has a large amount of assistance in the milking, cleaning out of the barns, feeding, handling of the milk, washing milk utensils, driving milk to the station or the factory, from members of his own family, such as the boys and girls and in many cases the housewife. It is doubtful if one per cent of these farmers ever estimate the value of this labour. Certainly, every cow in every herd should give full account for the labour, not only expended in milking, cleaning out of the barns and the feeding, but also of the handling and marketing of the milk from the same.

VALUATION OF MANURE

It is admitted that the above valuations of manure seem abnormally high. Nevertheless, one is safe in saying that the majority of farmers in the Maritime Provinces buy a certain amount of commercial fertilizer. If these farmers pay 18 cents a pound for their nitrogen and proportionately for potash and phosphates included in their commercial fertilizer, why should they not value the same ingredients in their manure as highly? Hence my valuations are based on this conclusion. It is plain to be seen that the average farmer in eastern Canada does not take this stand, else we would see fewer manure stacks under the eaves of the barn or manure pits which are seeping away the liquid manure, the best by 50 per cent of the total manure value. If the average farmer considered the above statement, he would not only take better care of manure before being applied to the land, but he would work his manure into the soil with greater consideration, and hence would get a great deal more value from this most important farm by-product.

DON'T take our word only, but examine the Lister Engine at work alongside any other, compare its quality, efficiency, economy—In a word, let the engine speak for itself and you will become another delighted user of

THE LISTER
GASOLINE ENGINE
(British Made Throughout)



The most reliable, best quality and value.

Starts instantly — every time, with Bosch Magneto ignition—no batteries to run down and give trouble.

Self-oiling, no oil cups to fill—no oil to waste.

Self-regulating at all loads. No attention needed when at work.

Fitted with phosphor-bronze bearings throughout, the best money can buy.

No babbit metal to wear and run out.

In a word, the best quality engine ever seen in Canada

We have sold over 50,000 Melotte Cream Separators in Canada during 15 years. Ask any Canadian user how he likes the Melotte.

Well—**we guarantee** the Lister as good an engine as the Melotte is a cream separator. We can't say more.

116

CHEAPENING PRODUCTION.

How we can show a greater profit per cow should be the outcome of such calculations and discussions. Briefly, the methods which we are using are as follows:—

BETTER FARMING

Better farming will certainly cheapen the cost of roughages. This can only be done by thorough, systematic and careful methods, incorporated in which shall be better rotations of crops, better seed, better methods of cultivation, the use of larger and more improved implements, the use of more horse power and less manual labour, and all such features, with which we are acquainted.

MORE SUCCULENT AND ROUGHAGE FEEDS

The most important method of cutting down cost of production is the raising of more succulents. It must be admitted that the average farmer in these provinces does not produce the quantity of turnips and mangels which he could feed most profitably to his dairy cows. Again, the average farmer feeds altogether too much grass hays to his cattle. The best quality of clover hay gives greater profits than any other quality of hay. It is well known that clovers give a double profit in this way, for not only are they worth a half more for milk production, but a good crop of clover hay leaves on the land, in the fertilizing value of roots, the equivalent of approximately ten tons of barnyard manure per acre. When the times comes, if it does, when the Eastern Provinces can raise corn ensilage and alfalfa hay as economically as they can now raise turnips and clover hay, another most radical step in the cheapening of cost of production will be taken. Another point in which the most of us dairy producers in eastern Canada are backward is the production of green feeds for summer use to tide over shortage of pasture, poor quality of pasture and droughts. The growing of such green feeds materially cheapens production from every viewpoint, for not only is it a cheap foodstuff, but at the same time it holds cows up in their milk to tide over a shortage of succulent feeds, thus holding them to a higher production when environments are more advantageous toward economic production of milk.

GRAINS.

It is undoubtedly most economical for the average dairyman to purchase quite a large proportion of the meals fed to the cows, nevertheless closer study of markets and better methods of buying meals would save many dollars, which the dairy cow must pay for. Again, often it may be noticed that meal feeds are so high that it would pay farmers to feed a large proportion of their home-grown grains, such as ground oats, ground barley and ground pease. This is a big subject in itself and one which demands closest attention.

PASTURE

The question of better pasture is one also which will materially assist you in cutting down the cost of foodstuffs per annum for your dairy cows The renovating of old pastures, either by reseeding, applications of direct or indirect commercial fertilizers, orthe application of a light top-dressing of manure, to suit you own individual and local couditions, is money well spent andwill return to you a very heavy percentage in the form of a cheaper summer food for your dairy cows.

From a careful study of the above figures and valuations you will agree with me that there are only three ways in which we can hope for larger profite from our cows, namely, (1) to cheapen the cost of production, (2 to use as much up-to-date dairy machinery as will decrease our labour account, and (3) to have better cows. We cannot decrease the cost of buildings, for the average buildings in this province demand greater expenditure in order to make possible the production of a good pure product. We cannot hope for an immediate or marked advance in the value of milk, although undoubtedly for city consumption above valuations are ridiculously low. Applying every effort toward the improving of our cows, cheapening of food stuffs and better ing our methods through the closer study of each term of the above accounts and through the assistance of cow testing associations, or cow testing methods, is the only salvation.—E. S. Archibald, Dominion Animal Husbandman, Ottawa.

SHARPLES MILKER

The Modern Way In Dairying

"To get away from hired help troubles and to ensure the production of clean milk on an economical basis I decided, after investigation, to put in the SHARPLES MILKER. I was convinced inasmuch as it is milking the best herds in the country, it should be worth a trial.

"I can milk, strip and weigh the milk from 25 cows in an hour and a half with my two-unit outfit. With the regular one-man equipment of three units 30 cows an hour can be milked. I can do this work easily single handed. I have used the machine seven months and intend to increase the equipment."

Such endorsement by actual users says all that need be said. The name of this user will be furnished on request.

THE HORSE.

Special Kinds of Horse Shoes.

In a recent article dealing with the form of horse shoes in ordinary use, allusion was made to various other kinds of horse shoes of modified pattern or special design, the use of which is resorted to in certain contingencies, notably in cases of defective action or in the case of specific forms of unsoundness, and it is proposed in this article to give a brief description of the shoes included in this category. The contingency which most frequently necessitates a modified form of shoeing is when horses brush or cut themselves on the leg, in which case recourse is often had to what is known as a

FEATHER-EDGED OR KNOCKED-UP SHOE.

In this pattern the inside quarter and heel are made quite narrow or skate-shaped (feathed-edged), and instead of the nail-holes being arranged in the usual manner, only a couple are punched on this side, which are placed at the toe, an extra nail-hole very usually being made on the outer half of the shoe as a compensation. This shoe is so fittted as to keep the inside half well within the circumference of the wall of the foot, the protruding horn subsequently being raped away until it is flush with the edge of the shoe. Another kind of shoe occasionally used with a view to counteracting the tendency to brush is the three-quarter shoe. This is aptly described by its name, it having a portion of one of its branches cut off, leaving it only about half as long as usual on that side of the toe, while the other branch is left the full length. Thus the entire circumference of the shoe is not much more than about three-quarters of that of an ordinary one. While it may sometimes prove useful in a case of brushiog, the three-quarter shoe, is, however, principally for use in the case of horses suffering from corns. By applying this pattern to the affected foot, that part of the heel where the corn is located is not touched by the shoe, and thus is relieved of all pressure from the latter. This will, in the majority of cases, afford immediate relief, and ensure the horse going sound again as soon as the acute pain in the bruised corn has subsided.

THE BAR-SHOE.

Another well-known special pattern is the so-called bar-shoe, the distinceive feature of which consists in the ends of the branches being connected by a bar of iron. Thus there is no open space between the heels, as is ordinarily the case, but we have instead a completely closed rim of iron. The purpose of this bar is to obtain an increased bearing surface for the foot, and to take some of the weight or bearing of the parts where the bar, upom which the frog largely bears, where as this part does not, of course, take any bearing on a shoe of the usual type. Consequently, by using a bar shoe we, to a certain extent, relieve those parts of the hoof which usually have to take all the bearing. There are two kinds of this form of shoe, namely, the straight and the heart-shaped. In the first the connecting bar between the heels is straight; in the second it is curved inwarns, the purpose of this being to prevent the risk of the horse catching the toe of the hind foot in the bar and pulling off the shoe, a contingency not unlikely to happen with the straight bar-shoe, more particularly if the horse is used at fast paces. A bar-shoe is used in various complaints or forms of unsoundness affecting the foot, in cluding cases of corn, sand crack, false quarter, seedy toe, and chronic laminitis; and it is found to be particularly valuable under these circumstances if the heels are low and inherently weak. Both horses employed in slow work and in fast work may suitably be shod with it, should its use be indicated, the latter preferably with the heart-shaped pattern. One great drawback connected with the bar-shoe is the fact that it impairs the security of the foothold on streets and slippery tarred roads.

HIGH-HEELED SHOE.

Next there is the high-heeled shoe, distinguished by its having very high heels, to which recourse is often had when horses are lame with curb or suffer from a sprain of the back sinews. The object of this shoe is to raise the heel of the foot well off the ground, and so to relax, relieve and partially rest the strained structures thus accelerating their recovery. When a high-heeled shoe is applied in it exclusively falls when an ordinary shoe is used, and to transfer it on to

a case of sprained back tendons, it is however, necessary to take good care that it does not reamin on too long, otherwise, instead of proving beneficial, it may easily entail serious mischief through causing the tendons to become contracted, for the fact of their being kept constantly relaxed, and not at their normal degree of tension will naturally tend to induce contraction in them, more especially as there is usually an inherent tendency that way in the case of bad sprains. High-heeled shoes, having a bar at the back, which joins the two heels—a principal type of this description of shoe—are known also as pattern shoes, but, although in repect of the heel bar between the branches, the pattern shoe is some what similar to a bar-shoe, its similarity with the latter ends here, and the two kinds of shoe are not to be confused with one another, for they serve entirely different purposes. At one time the use of high-heeled or pattern shoes in cases of lameness from sprains was in very common vogue, but more recently their use has become much restricted.

THE ROCKER SHOE.

Another occasional type of shoe is the rocker or rocking shoe, which is designed for use in cheonic laminitis. Its special feature is that it imparts a rocking motion to the foot, it being made extra thick—about double the usual thickness—in the middle, while it is thinned off in gradual fashion, both towards the toes and the heels. This naturally causes it to rock, like the rocker of a cradle. The iron used in making a rocker shoe is extra wide, so that, in addition to the wall of the foot, the sole also takes a comparatively wide bearing upon the shoe. It is often made in the form of a bar-shoe, and in this shape probably proves the most efficient. Rocker shoes are adapted for use only in the case of a horse worked at a walking pace, and they are altogether comparatively seldom seen nowadays. A somewhat similar pattern is that known as Broad's shoe, which is also used in cases of chronic laminitis and kindred foot troubles.

THE CHARLIER METHOD.

At one period a great deal was heard of the Charlier shoe and the special method of shoeing which its use involved. It never, however, gained any extended vogue, despite the stir it made, and, although its possibilities are still sometimes dilated upon by theorists, it can no longer be regarded as a practical proposition, and has become obsolete. Horses used for hacking are sometimes shod with tips instegd of with full-sized shoes, and occasionally these are also applied to the feet of hunters. Tips may be described as light and thin plates, only about half the size of the ordinary shoe, as regards the length of the branches, and they protect only the anterior portion of the foot, leaving the heel part uncovered. In its way this type of shoe is useful and practical, its chief advantage consisting in the fact that it does not interfere in any wise with the natural functions and play of the foot, and allows the frog to take a full bearing upon the ground, the same as if the horse were not shod at all, which is very beneficial. Horses given to cutting or brushing will also, in the majority of cases, be found to be less liable to do so when shod with tips than when wearing the ordinary shoe. But tips, on account of their thinness, have little wear in them, and consequently they can be used only on horses which are kept almost entirely to soft going. Apart from this, they will not afford enough protection to the feet of horses used on roads and streets. Even as regards saddle horses, confined mainly to going of a soft order, they would, in many cases, not sufficiently protect them in the long run, so that discretion must be used in having recourse to them. Finally, a new kind of non-slipping shoe may briefly be referred to which has recently been introduced. It is of the ordinary form, but is studded with transverse ridges or projections on the ground surface, intended to confer a better grip. This shoe appears to be a practical one, but whether it will stand the test of general use and gain any favour remains to be seen.—Argus in Farm and Home, England.

Gombault's Caustic Balsam

The Worlds Greatest and Surest

Veterinary Remedy

HAS IMITATORS BUT NO COMPETITORS!

SAFE, SPEEDY AND POSITIVE.

Supersedes All Cautery or Firing. Invaluable as a CURE for

FOUNDER,

IN THE FIELD MAKING MONEY—

or in the Barn Wasting It

Whether your horses work or not, their feed costs you big money. When a horse is laid up you not only lose the cost of *feed*, but also the profit that the horse would have paid if *able* to work in the field.

Since there is no way to *prevent* spavin, curb, splint, ringbone, sprains and lameness, your thought should be given to the quickest, surest and most economical *cure*. And for over 35 years, thousands of horsemen have depended on Kendall's Spavin Cure. It's the old, reliable, *safe* remedy that has saved thousands of dollars' worth of *horse flesh*, to say nothing of the *worry*, *time* and *trouble* it has saved horse owners. *You* should get and keep a bottle of—

Kendall's Spavin Cure

for emergencies. You never can tell when you'll need it, and when the time does come, you'll be mighty glad you had the foresight to prepare. Here are samples of the thousands of letters we receive from grateful horse owners every year Mr. C. E. Hull, Kingston, Ont., writes:—"I have used Kendall's Spavin Cure for years with never failing success." Mr. E. A. Coon, Carnduff, Sask., says:—"I have used your Spavin Cure with great success on my stock as well as for domestic purposes. It is the best thing I can get for Sprains and Rheumatism—also for Splints, Galls and Sore Shoulder in horses." Mr. W. Shaults, Hand Hill, Alta., writes:—"I have used your Spavin Cure for years and keep it on hand at all times. It is good for man and beast." And Mr. Wm. Booth, of Grovette, Ark., writes:—"I have cured both Blood and Bone Spavins, taking the bunch all off and leaving the horse as sound as he ever was. The horse does not need entire rest while using Kendall's Spavin Cure. Light work and careful handling are better than standing in the barn. If the horse was in the pasture, not many people would take proper care of him. I use the Spavin Cure a week at least, sometimes three, according to the severity of the trouble. There is enough in one bottle to cure three large Spavins if used according to directions. It is excellent for bruises, both for man and beast. Your Spavin Cure will cure Thoropin in a hurry. With over twenty years' experience with this remedy I know what I say to be true. If one doubts my my word he may bring me a horse with a Blood Spavin on one leg, Bone Spavin on the other and Thoropin on both and I can make him a sound horse in six months. What I have done, I can do again and what I have done others can do."

Why experiment with other remedies—when you know what Kendall's has done and can do. You can get Kendall's Spavin Cure at any druggist's. $1.00 per bottle, 6 for $5.00. Ask for free book. "Treatise on the Horse," or write direct to

shoulder. These steaks should not be cut as thick as loin chops or rib chops because coming as they do ... the
from the shoulder the muscles are tougher and stringier than the muscles in the loin or rib chops. However, these chops are economical and serve as a change in kind of meat served when the more popular and higher-priced loin and rib chop

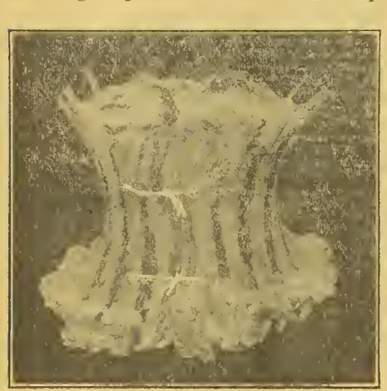

Fig. 22. A Crown Roast

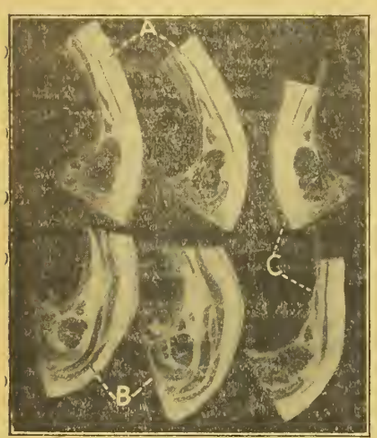

Fig. 23. Rib Chops.

cannot be afforded. The shoulders are also largely used for stews. When used for this purpose, they should be cut into small squares to suit the consumer. It should be remembered that commercially the shoulders are cut one or two ribs shorter than just described.

The Neck.—The neck is used entirely for stews and broths. All soiled parts should be trimmed off and the neck cup up in convenient sizes. The quality of the stew is improved by removing some of the large bones from the neck.

Trimmings.—All the lean, clean trimmings obtained in the preparation of sheep cuts for the table, should be used for stew. Such trimm ngs as those coming from the leg, the shoulder, or the rib ends, that are taken off in making French crops should not be wasted. These trimmings make as good stews as the plate or flank. The kidneys may be fried, stewed, or used for soup. The

Fig. 25. Shoulder Steaks

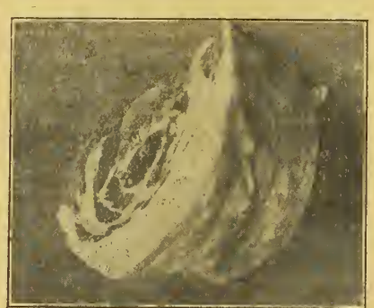

Fig. 26. The Neck

heart and tongue may be used fresh or pickled. Care should be taken to see that these are kept clean while dressing the sheep and they should be cooled out as quickly as possible afterwards. The liver can be used for the same purpose as livers from other animals, though they should not be used unless healthy and free from parasites.

Construction of Silos.

In compliance with the requests of of several of our Lunenburg County readers we publish the following article on The Construction of Silos:—

The silo and silage are matters of great interest to the stock raiser, as there is no branch of the business that strikes deeper into the pocketbook than that of feed. All over the country the most progressive farmers are using silage as a prominent part of the dairy feed, as the average cost of raising silage will not be much over $1.25 per ton when properly conducted. Good silage ought to yield at the rate of from ten to twelve or more tons per acre.

THE SILO

A full grown cow will consume from one and one-half to two cubic feet of ensilage per day, but generally it has been found advisable to make one of three feedings per day.

At one and one-half cubic feet per day, a cow would consume in six months, 270 cubic feet, allowing for waste, say 300 cubic feet. If we multiply 300 cubic feet by the number of animals we wish to feed, it will give the size that is required to build in cubic feet.

The following table gives the capacity in tons of different sized silos. It is reckoned at forty cubic feet per ton and a ton to each cow one month That is about sixty-six pounds per day, which is liberal feeding. The quantity is computed for six months, estimating fifteen tons per acre.

As to height, the modern ensilage cutters have carriers to almost any length. The silo should not be too large on top. It is best to uncover

the whole at a time, taking off the entire top each day.

In locating the silo, it should by all means be placed so as to open into the cow stable and on a level with it, but not directly into the stable. The idea is to keep the odor from the barn except when feeding.; that is, in a barn for dairy cows, as the milk, while being taken from the cows, absorbs the odor, and has been the cause of condemned milk from ensilage fed cows. This contamination comes from the odor in the barn and not because the animals feed on ensilage.

STAVE SILOS

There are several styles of silos in use, which are constructed of various materials. The style which is preferable will depend to a certain extent upon circumstances. The round stave silo has certain advantages. It is [illegible] construction and is cheapest. The cost will be about $1.00 per ton. That is a silo of one hundred tons capacity will cost about $100.00. Most farmers will have no difficulty in constructing a round stave silo. The staves are cut generally two by six inches, the length varying according to the height of the silo. For a thirty foot silo use staves sixteen and fourteen feet joined alternately, so that the joints will not be opposite each other. The joints are made by sawing a groove in the ends, and fitting in a piece of hoop iron. It is advisable to have a cement floor in the silo. The hoops may be made of heavy band iron or three-quarter inch round, each hoop in two sections, so arranged that they can be tightened or loosened as required. In making connections use a block of wood or castings. Openings eighteen by twenty four inches each, three feet apart, can be cut after the silo is built, to throw out the silage. Cut in a slant so that they will fit closely.

The stave silo can be improved very materially, by bricking it up inside, four inches thick, the same as wells are bricked and plastered inside with cement. This makes the silo airtight and frost-proof, which are two very important factors necessary to secure and maintain a good quality of silage.

A second form of wooden silo is more substantial than the stave silo and is perfectly airtight. The frame work is made of two by six upright and fifteen inch centres for a silo thirty feet high. The uprights may be farther apart for a lower silo. The inside sheeting is two layers of half inch lumber with tar paper between. The outside is of half-inch matched lumber. Openings must be made at the top and bottom for air, between the outside and inside sheetings. These should be covered with wire screen to prevent mice getting in. The cost of the above silo is about one dollar and one-half per ton capacity.

A recent issue of The Farmers Advocate had the following description of a new type of silo. The particular described is 38 feet high and 13 feet in diameter, and was built by the owner for the comparatively small sum of $150.

"The method of construction is rather unique to those who are not familiar with such a silo. The outside is hemlock, tongued and grooved lumber, and bands to which this is

THIS year ten disk harrows will be sold where one was sold five years ago. Why? Because so many farmers have learned that the proper use of a disk harrow is the best guarantee of a successful crop.

Proper use of a disk harrow means the purchase of a McCormick disk harrow because they are the ones built to do the best work. The frames are strong, to stand the strain of following the binder or of disking hard ground. The set levers keep the gangs to their work at even depth. The bearings are the most durable that can be put on a disk harrow.

The full line includes disk, peg tooth, and smoothing harrows, drills and cultivators. See this line before you buy. We send catalogues on request.

"The Disk Harrow," a book which illustrates and explains the proper preparation of a seed bed, and gives examples of the value of disking—32 pages of valuable information—is yours for four cents to cover postage and packing.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

My passion takes away my appetite and makes me wear my new neckkerchief continually. I have no relief but in putting on my best clothes and in having my boots cleaned over and over again. I seem then, to be worthier of the eldest Miss Larkins. Everything that belongs to her, or is connected with her, is precious to me. Mr. Larkins, a gruff old gentleman with a double chin, and one of his eyes immovable in his head, is fraught with interest to me. When I can't meet his daughter, I go where I am likely to meet him. To say "How do you do, Mr. Larkins? Are the young ladies and all the family quite well?" seems so pointed, that I blush.

I think continually about my age. Say I am seventeen, and say that seventeen is young for the eldest Miss Larkins, what of that? Besides, I shall be one-and-twenty in no time almost. I regularly take walks outside Mr. Larkin's house in the evening, though it cuts me to the heart to see the officers go in, or to hear them up in the drwaing-room, where the eldest Miss Larkins plays the harp. I even walk, on two or three occasions, in a sickly, spoony manner round and round the house after the family are gone to bed, wondering which is the eldest Miss Larkins' chamber (and pitching, I dare say now, on Mr. Larkins's instead); wishing that a fire would burst out; and the assembled crowd would stand appalled; that I, dashing through them with a ladder, might rear it against her window, save her in my arms, go back for something she had left behind, and perish in the flames. For I am generally disinterested in my love, and th nk I could be content to make a figure before Miss Larkins and expire. Generally, but not always. Sometimes brighter visions rise before me. When I dress (the occupation of two hours), for a great ball given at the Larkins's (the anticipation of three weeks), I indulge my fancy with pleasing images I picture myself taking courage to make a declaration to Miss Larkins. I picture Miss Larkins sinking her head on my shoulder, and saying, "Oh, Mr. Copperfield, can I believe my ears!" I picture Mr. Larkins waiting on me next morning, and saying, "My dear Copperfield, my daughter has told me all. Youth is no objection. Here are twenty thousand pounds. Be happy!" I picture my aunt relenting, and blessing us; and Mr. Dick and Doctor Strong being present at the marriage ceremony. I am a sensible fellow, I believe—I believe, on looking back, I mean—and modest I am sure; but all this goes on notwithstanding.

I repair to the enchanted house, where there are lights, chattering, music, flowers, officers (I am sorry to see), and the eldest Miss Larkins, a blaze of beauty. She is dressed in blue, with blue flowers in her hair—forget-me-nots—As if she had any need to wear forget-me-nots! It is the first really grown-up party that I have ever been invited to, and I am a little uncomfortable; for I appear not to belong to anybody, and nobody appears to have anything to say to me, except Mr. Larkins, who asks me how my school-fellows are, which he needn't do, as I have not come there to be insulted.

But after I have stood in the doorway for some time, and feasted my eyes upon the goddess of my heart, she approaches me—she, the eldest Miss Larkins!—and asks me pleasantly, if I dance?

I stammer, with a bow, "With you, Miss Larkins."

"With no one else?" enquires Miss Larkins.

"I should have no pleasure in dancing with anyone else?"

Miss Larkins laughs and blushes (or I think she blushes), and says, "Next time but one, I shall be very glad."

The time arrives. "It is a waltz." I think," Miss Larkins doubtfully observes, when I present myself. "Do you waltz? if not, Captain Bailey—"

But I do waltz (pretty well, too, as it happens), and I take Miss Lark ns out. I take her sternly from the side of Captain Bailey. He is wretched, I have no doubt; but he is nothing to me. I have been wretched too. I waltz with the eldest Miss Larkins! I don't know where, among whom, or how long. I only know that I swim about in space, with a blue angel, in a state of blissful delirium, until I find myself alone with her in a little room, resting on a sofa. She admires a flower (pink camellia japonica, price half-a-crown), in my button-hole. I give it her, and say:

"I ask an inestimable price for it, Miss Larkins."

"Indeed! What is that?" returns Miss Larkins.

"A flower of yours, that I may treasure it as a miser hoards gold."

"You're a bold boy," says Miss Larkins. "There."

She gives it to me; not displeased; and I put it to my lips, and then into my breast. Miss Larkins, laughing, draws her hand through my arm, and says, "Now take me back to Captain Bailey."

I am lost in the recollection of this delicious interview, and the waltz, when she comes to me again, with a plain elderly gentleman, who has been playing whist all night, upon her arm, and says:

"Oh here is my bold friend! Mr. Chestle wants to know you, Mr. Copperfield."

I feel at once that he is a friend of the family, and am much gratified.

"I admire your taste, sir," says Mr. Chestle. "It does you credit. I suppose you don't take much interest in hops; but I am a pretty large grower myself; and if you ever like to come over to our neighborhood—neighborhood of Ashford—and take a run about our place, we shall be glad for you to stop as long as you like."

I thank Mr. Chestle warmly, and shake hands I think I am in a happy dream. I waltz with the eldest Miss Larkins once again. She says I waltz so well! I go home in a state of unspeakable bliss, and waltz in imagination, all night long, with my arm around the blue waist of my dear divinity. For some days afterwards, I am lost in rapturous reflections; but I neither see her in the street, nor when I call. I am imperfectly consoled for this disappointment by the sacred pledge, the perished flower.

"Trotwood," says Agnes, one day after dinner. "Who do you think is going to be married to-morrow? Some one you admire."

"Not you, I suppose, Agnes?"

"Not me!" raising her cheerful face from the music she is copying. "Do you hear him, Papa?—The eldest Miss Larkins."

"To—to Captain Bailey?" Ihave just power to ask.

"No; to no Captain. To Mr. Chestle, a hop-grower."

I am terribly dejected for about a week or two. I take off my ring, I wear my worst clothes, I use no bear's grease, and I frequently lament over the late Miss Larkins's faded flower. Being, by that time, rather tired of this kind of life, and having received new provocation from the butcher, I throw the flower away, go out with the butcher, and gloriously defeat him.

This, and the resumption of my ring, as well as of the bear's grease in moderation, are the last marks I can discern, now, in my progress to seventeen.

CHAPTER XIX

I Look About Me, and Make a Discovery.

I am doubtful whether I was at heart glad or sorry, when my school days drew to an end, and the time came for my leaving Doctor Strong's I had been very happy there, I had a great attachment for the Doctor. and I was eminent and distinguished in that little world. For these reasons I was sorry to go; but for other reasons, unsubstantial enough, I was glad. Misty ideas of being a young man at my own disposal, of the importance attaching to a young man at his own disposal, of the wonderful things to be seen and done by that magnificent animal, and the wonderful effects he could not fail to make on society, lured me away. So powerful were these visionary considerations in my boyish mind, that I seem, according to my present way of thinking, to have left school without natural regret. The separation has not made the impression on me, that other separations have. I try in vain to recall how I felt about it, and what its circumstances were; but it is not momentous in my recollection. I supposed the opening prospect confused me. I know that my juvenile experiences went for little or nothing then; and that life was more like a great fairy story, which I was just about to begin to read, than anything else.

My aunt and I held many grave deliberations on the calling to which I should be devoted. For a year or more I had endeavoured to find a satisfactory answer to her oft-repeat- nuestion, "What I would ,ike to be?" But I had no particular liking, that I could discover, for anything. If I could have been inspired with a knowledge of the science of navigation, taken the command of a fast-sailing expedition, and gone round the world on a triumphant voyage of discovery, I think I might have considered myself completely suited. But in the absense of any such miraculous provision, my desire was to apply myself to some pursuit that would not lie too heavily upon her purse; and to do my duty in it, whatever it might be.

Mr. Dick had readily assisted at our councils, with a meditative and sage demeanour. He never made a suggestion but once; and on that occasion (I don't know what put it into his head), he suddenly proposed that I should be a "Brazier." My aunt received this proposal so very ungraciously, that he never ventured on a second; but ever afterwards confined himself to looking watchfully at her for her suggestions, and rattling his money.

"Trot, I tell you what, my dear," said my aunt, one morning in the Christmas season when I left school; "as this knotty point s still unsettled, and as we must not make a mistake at our decision if we can help it. I think we had better take a little breathing-time. In the meanwhile, you must try to look at it from a new point of view, and not as a schoolboy."

"I will, aunt."

"It has ocurred to me," pursued my aunt, "that a little change, and a glimpse of life out of doors, may be useful, in helping you to know your own mind, and from a cooler jndgment. Suppose you were to take a little journey now. Suppose you

A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write to-day. Address: Mrs. M. Summers, Box. . 509 Windsor, Ont.

THE CHARM OF MOTHERHOOD

Enhanced By Perfect Physical Health.

The experience of Motherhood is a trying one to most women and marks distinctly an epoch in their lives. Not one woman in a hundred is prepared or understands how to properly care for herself. Of course nearly every woman nowadays has medical treatment at such times, but many approach the experience with an organism unfitted for the trial of strength, and when it is over her system has received a shock from which it is hard to recover. Following right upon this comes the nervous strain of caring for the child, and a distinct change in the mother results.

There is nothing more charming than a happy and healthy mother of children, and indeed child-birth under the right conditions need be no hazard to health or beauty. The unexplainable thing is that, with all the evidence of shattered nerves and broken health resulting from an unprepared condition, and with ample time in which to prepare, women will persist in going blindly to the trial.

Every woman at this time should rely upon Lydia E. Pinkham's Vegetable Compound, a most valuable tonic and invigorator of the female organism.

In many homes once childless there are now children because of the fact that Lydia E. Pinkham's Vegetable Compound makes women normal, healthy and strong.

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

JUST THE COLLAR FOR THOSE WHO WORK

The CHALLENGE BRAND WATERPROOF COLLARS

No shiny celluloid or hard rubber about "Challenge" Waterproof Collars.

S. KERR Principal

were to go down in the old part of the country again, for instance, and see that —that out-of-the-way woman with the savagest of names." said my aunt, rubbing her nose, for she could never thoroughly forgive Peggotty for being so called.

"Of all things in the world, aunt, I should like it best!"

"Well," said my aunt, "that's lucky, for I should like it too. But it's natural and rational that you should like it. And I am very well persuaded that whatever you do, Trot, will always be natural and rational."

"I hope so, aunt."

"Your sister, Betsey Trotwood," said my aunt, "would have been as natural and rational a girl as ever breathed. You'll be worthy of her, won't you?"

"I hope I shall be worthy of you, aunt. That will be enough for me."

"It's a mercy that poor dear baby of a mother of your's didn't live," said my aunt, looking at me approvingly, "or she'd have been so vain of her boy by this time, that her soft little head would have been completely turned, if there was anything left of it to turn." (My aunt always excused any weakness of her own in my behalf, by transferring it in this way to my poor mother). "Bless me, Trotwood, how you do remind me of her!"

"Pleasantly, I hope, aunt?" said I

"He's as like her, Dick," said my aunt, emphatically, "he's as like her, as she was that afternoon, before she began to fret. Bless my heart, he's as like her as he can look at me out of his two eyes."

"Is he indeed?" said Mr. Dick.

"And he's like David, too," said my aunt decisively.

"He is very like David!" said Mr. Dick.

"But what I want you to be, Trot," resumed my aunt, "—I don't mean physically, but morally; you are very well physically—is, a firm fellow. A fine firm fellow, with a will of your own. With resolution," said my aunt, shaking her cap at me, and clenching her hand, "With determination. With character, Trot. With strength of character that is not to be influenced, except on good reason, by anybody, or anything. That's what I mean you to be. That's what your father and mother might both have been, Heaven knows, and been the better for it."

I intimated that I hoped I should be what she described.

"That you may begin, in a small way, to have a reliance upon your self, and to act for yourself," said my aunt, "I shall send you upon your trip, alone. I did think, once, of Mr. Dick's going with you; but on second thoughts, I shall keep him to take care of me."

Mr. Dick, for a moment, looked a little disappointed; until the honor and dignity of having to take care of the most wonderful woman in the world, restored the sunshine to his face.

"Besides," said my aunt, "there's the Memorial."

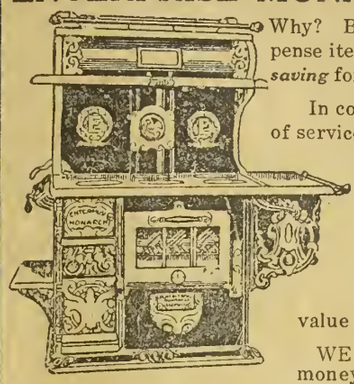
"Oh, certainly," said Mr. Dick, in a hurry, "I intend, Trotwood, to get that done immediately—it really must be done immediately! And then it will go in, you know—and then—," said Mr. Dick, after checking himself, and pausing a long time, "there'll be a pretty kettle of fish!"

In pursuance of my aunt's kind scheme, I was shortly afterwards fitted out with a handsome purse of money, and a portmanteau, and tenderly dismissed upon my expedition. At parting, my aunt gave me some good advice, and a good many kisses: and said that as her object was that I should look about me, and should think a little, she would recommend me to stay a few days in

Everybody's Talking---"THE HIGH COST OF LIVING"

but it isn't everybody who can help to lessen it. We can do so by providing you with an

ENTERPRISE MONARCH STEEL RANGE



Why? Because Food and Fuel are two big expense items and the MONARCH can effect *a big saving* for you in these.

Ladies' Short Course

HOUSEHOLD SCIENCE

SUSSEX, N. B.

March 31st, April 1st, 2nd and 3rd.

ALL INSTRUCTION FREE

The Short Course for Ladies will start Tuesday morning, March 31st and close Friday evening, April 3rd. A Household Science equipment has been installed in the Dairy School. All women present will have the opportunity of cooking and testing each recipe. The lectures will include talks on "Food Values," "Food and Diet," "The Preservation of Food," etc. It is to be hoped not only members of the Women's Institutes will take advantage of this opportunity, but every woman interested in "Better Homes," will attend.

The demonstrations are as follows:—

Lesson I.—Meats and Fish—Their preparation and Cooking.
Lesson II.—Flour Mixtures:—drop batters and soft doughs
Lesson III.—Cream Soups.
Lesson IV.—Sandwiches.
Leason V.—Cake Mixtures.
Lesson VI.—Cold and Frozen Desserts.
Lesson VII.—Cheese:—Various methods of cooking; its high food value compared with other more expensive foods.
Lesson VIII.—Puddings and Pudding Sauces.

For information about Ladies' Short Course, address

MISS HAZEL WINTER,

Supervisor of Women's Institutes for New Brunswick, Fredericton, N. B.

Board can be secured at current rates. The Superintendent will have a list of suitable places.

At nearest I. C. R. Station purchase a single first-class ticket to Sussex and get a Standard Certificate from the Ticket Agent.

Refund will be made on all tickets of $3.00 and upwards.

WISENER, Pictou, N. S.

Many sufferers from rheumatism have been surprised and delighted with the prompt relief afforded by applying Chamberlain's Liniment. Not one case of rheumatism in ten requires any internal treatment whatever. This liniment is for sale by all dealers.

London, if I liked it, either on my way down into Suffolk, or in coming back. In a word, I was at liberty to do what I would, for three weeks or a month; and no other conditions were imposed upon my freedom than the before-mentioned thinking and looking about me, and a pledge to write three times a week and faithfully report myself.

I went to Canterbury first, that I might take leave of Agnes and Mr. Wickfield (my old room in whose house I had not yet relinquished), and also of the good Doctor. Agnes was very glad to see me, and told me that the house had not been like itself since I left it.

"I am sure I am not like myself when I am away," said I. "I seem to want my right hand, when I miss you. Tough that's not saying much much; for there's no head in my right hand and no heart. Every one who knows you, consults with you, and is guided by you, Agnes."

"Every one who knows me, spoils me, I believe," she answered smiling.

"No. It's because you are like no one else. You are so good, and so sweet-tempered. You have such a gentle nature, and you are always right."

"You talk," said Agnes, breaking into a pleasant laugh, as she sat at work, "as if I were the late Miss Larkins."

"Come!" It's not fair to abuse my confidence," I answered, reddening at the recollection of my blue enslaver "But I shall confide in you, just the same, Agnes. I can never grow out of that. Whenever I fall into trouble, or fall in love, I shall always tell youi if you'll let me—even when I come to fall in love in earnest."

"Why, you have always been in earnest!" said Agnes, laughing again.

"Oh! that was a child, or a schoolboy," said I, laughing in my turn, not without being a little shamefaced. "Times are altering now, and I suppose I shall be in a terrible state of earnestness one day or other. My wonder is, that you are not in earnest yourself, by this time, Agnes."

Agnes laughed again, and shook her head.

"Oh, I know you are not!" said I "because if you had been, you would have told me. Or at least," for I saw a faint blush in her face, "you would have let me find it out for myself. But there is no one that I know of, who deserves to love you, Agnes. Some one of a nobler character, and more worthy altogether than anyone I have ever seen here, must rise up, before I give my consent. In the time to come, I shall have a wary eye on all admirers; and shall exact a great deal from the successful one, I assure you."

We had gone on, so far, in a mixture of confidential jest and earnest. that had long grown naturally, out of our familiar relations, begun as mere children. But Agnes, suddenly lifting up her eyes to mine, and speaking in a different manner, said:

"Trotwood, there is something that I want to ask you, and that I may not have another opportunity of asking you for a long time, perhaps. Something I would ask, I think, of no one else. Have you observed any gradual alteration in Papa?"

I had observed it, and had often wondered whether she had too. I must have shown as much, now, in my face, for her eyes were in a moment cast down, and I saw tears in them.

"Tell me what it is," she said, in a low voice.

"I think—shall I be quite plain, Agnes, liking him so much?"

"Yes," she said.

"I think he does himself no good by the habit that has increased upon him since I first came here. He is often very nervous, or I fancy so."

"It is not fancy," said Agnes, shaking her head.

"His hand trembles, his speech is not plain, and his eyes look wild. I have remarked that at those times, and when he is least like himself, he is most certain to be wanted on some business."

"By Uriah," said Agnes.

"Yes; and the sense of being unfit

You can say goodbye to constipation with a clear conscience if you use Chamberlain's Tablets. Many have been permanently cured by their use. For sale by all dealers.

for it, or of not having understood iti or having shown his condition in spite of himself, seems to make him so uneasy, that next day he is worse, and next day worse, and so he becomes jaded and haggard. Do not be alarmed by what I say, Agnes, but in this state I saw him, only the other evening, lay down his head upon his desk, and shed tears like a child."

Her hand passed softly before my lips while I was yet speaking, and in a moment she had met her father at the door of the room, and was hanging on his shodlder. The expression of her face, as they both looked towards me, I felt to be very touching. There was such a deep fondness for him, and gratitude to him for all his love and care, in her beautiful look; and there was such a fervent appeal to me to deal tenderly by him, even in my inmost thoughts, and to let no harsh construction find any place against him; she was at once, so proud of him and devoted to him yet so passionate and sorry, and so reliant upon me to be so, too; that nothing she could have said would have expressed more to me, or moved me more.

We were to drink tea at the Doctor's. We went there at the usual hour; and round the study-fire found the Doctor, and his young wife, and her mother. The Doctor, who made as much of my going away as if I were going to China, received me as an honored guest; and called for a log of wood to be thrown on the fire that he might see the face of his old pupil reddening in the blaze.

"I shall not see many more new faces in Trotwood's stead, Wickfield" said the Doctor, warming his hands; "I'm getting lazy, and want ease. I shall relinquish all my young people in another six months, and lead a quiter life,"

"You have said so, any time these ten years, Doctor," Mr. Wickfield answered.

"But now I mean to do it," returned the Doctqr. "My first master will succeed me—I am in earnest at last—so you'll soon have to arrange our contracts, and bind us firmly to them, like a couple of knaves."

"And to take care," said Mr. Wickfield, "that you are not imposed on, eh! As you certainly would be, in any contract you should make for yourself. Well! I am ready. There are worse tasks than that in my calling."

"I shall have nothing to think of, then," said the Doctor, with a smile, "but my Dictionary; and this other contract-bargain—Annie."

As Mr. Wickfield glanced towards her, sitting at the tea-table by Agnes, she seemed to avoid his look with such unwonted hesitation and timidity, that his attention became fixed upon her, as if something were suggested to his thoughts.

"There is a post come in from India, I observe," he said, after a short silence.

"By-the-bye! and letters from Mr. Jack Maldon!" said the Doctor.

"Indeed!"

"Poor dear Jack!" said Mrs. Markleham, shaking her head. "That trying climate! Like living, they tell me, on a sand-heap underneath a burning glass He looked strong, but he wasn't. My dear Doctor, it was his spirit, not his constitution, that ventured on so boldly. Annie, my dear, I am sure you must perfectly recollect that your cousin never was strong; not what can be called robust, you know," said Mrs. Markleham, with emphasis, and looking round upon us generally; "from the time that my daughter and himself were children, together, and walking about, arm-in-arm, the live-long day."

Annie, thus addressed, made no reply.

"Do I gather from what you say, ma'am, that Mr. Maldon is ill?" asked Mr. Wickfield.

"Ill!" replied the old soldier. "My dear sir, he's all sorts of things."

"Except well?" said Mr. Wickfield.

"Except well, indeed!" said the old Soldier. "He has had dreadful strokes of the sun, no doubt, and jungle fevers and agues, and every thing you can mention. As to his liver," said the Old Soldier, resignedly, "that, of course, he gave up altogether, when he first went out."

"Does be say all this?" asked Mr. Wickfield.

"Say? My dear sir," returned Mrs. Markleham, shaking her head and her fan, "you little know my poor Jack Maldon when you ask that question. Say? Not he. You might drag him at the heels of four wild horses first."

"Mamma!" said Mrs. Strong.

(Continued in next issue)

NA-DRU-CO TASTELESS PREPARATION OF COD LIVER OIL

The Wonderful Spring Tonic

If you have had a hard winter, Na-Dru-Co Tasteless Preparation of Cod Liver Oil will help you to recuperate quickly and avoid the coughs and colds so prevalent during the changeable spring weather.

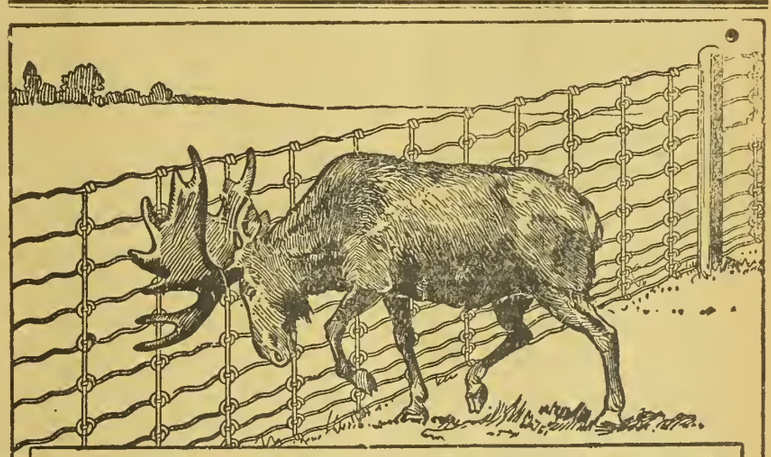
In this preparation the nutritive and curative properties of the best Norwegian Cod Liver Oil are combined with Hypophosphites, Cherry Bark and Malt Extract in a form that is really pleasant to take and easily digested even by the most delicate.

Thus the great objection to Cod Liver Oil is removed and every one who is run down or suffering from throat or lung troubles can take advantage of its unique medicinal and strengthening qualities.

Add to this the Tonic Hypophosphites, the healing Cherry Bark and the invigorating Malt Extract, and you have probably the finest food-tonic known.

Get a 50c. or $1.00 bottle from your Druggist. 314

NATIONAL DRUG AND CHEMICAL CO. OF CANADA, LIMITED.



This Fence Has Vast Strength

For a fourth less than the price we pay, we could get hard-drawn steel wire. But that kind, though used in most other wire fence, hasn't the *life*, the springiness, the strength we insist on for Maritime Wire Fence.

• • • •

So we make this fence of extra-heavy hard drawn steel wire of nine-gauge. Constantly we test it for quality. And so we *know* this fence has *more* strength than it probably will ever need.

• • • •

Yet the price of Maritime Wire Fence is no higher than you must pay for ordinary fence. But the life of the Maritime Fence is far longer—and the fence surely reliable.

• • • •

On this extra-quality wire we put a smooth, even heavy coat of galvanizing. We put on more than enough—that's our way. You gain by the longer life of this better fence. And we lock laterals and upright wire rigidly, yet springily, with a cross-leverage lock that simply CANNOT let go under the hardest strain.

• • • •

You can bank on the strength of this fence Make the test for yourself and your neighbors. Then get the agency—it will pay you well. Address

The Way to Solve the Dress Question.

The way to dress well at little cost is to purchase one or two packages of dyes, specially prepared for Home Use, from your nearest Druggist or Dealer. Now-a-days, they have dyes that are adapted for All Kinds of Cloth, which does away with the old trouble of having to know for certain what one's goods are made of. You can Dye anything right at home with these Dyes, with just as good results as Professional Dyers can give you. Thousands of women are Dyeing their clothes every day, and their dresses look just like new. If the goods you intend to Dye are already colored, you will have to find out what color they will take satisfactorily. Your Druggist or Dealer will be able to give you this information from his Color Card, or better still he will be able to supply you with a Booklet which is very complete in regard to the matter.

You no doubt have a dress that is hardly worn at all, but is out of fashion as to color and pattern. Here is where Home Dyeing steps in to help things out. Rip it up, Dye it a fashionable shade, and with a new pattern make it up into a most stylish gown, that will be the envy of your lady friends.

White Summer Dresses can be Dyed delicate shades of any color by using the dye very weak—say about an eighth of a package to about five gallons of water.

When on shopping expeditions, you have often noticed on the "Bargain Counters" Remnants offered at ridiculously prices. The reason for these low prices, was not by any means on account of the materials being of poor quality, but because the shades or colors were out of style; the materials often being of superior quality.

Now these bargains can be taken advantage of, and by the use of these Dyes, the colors can be changed to the most delicate shade of any of the fashionable colors popular at the time.

It is not alone to Wearing Apparel that Home Dyes lend their service. Portiers, Couch Covers, Table Covers, Shade Curtains, Draperies or in fact anything that is made of cloth can be made to look just like New by the aid of these Dyes.

White or very light colored goods can be Dyed any darker shade of any color.

Never try to color anything a lighter shade than the article is originally.

Just as soon as you have decided what you are going to Dye, you will want to know how much you will require. For lighter shades and for small articles such as Ribbons, Silk or Cotton Gloves, Stockings, Blouses, etc., one package as a rule will be enough. For Heavy Suits, Coats, Curtains, etc., it is best, if possible, to weigh the goods before they are wet, and use a package for about a pound of goods.

Something New for Men

Restore Your Own Strength--No Drugs

Manly Men Fascinate the Whole World

The free illustrated pocket compendium of private advice for all men, whether young or elderly, single or married, whether well or ailing (explained below), not only contains a great fund of necessary information upon certain avoided private subjects, telling you what to avoid, what to do and what not to do, but also fully describes a new small mechanical appliance called a VITALIZER which generates a natural force and which is now being worn by men all over the world who seek new manly vigor. You, yourself, no matter where you live, may easily have one of these little VITALIZERS to try out in your own case. Therefore, please use the coupon below and get this free pocket compendium by return mail. SANDEN. AUTHOR.

How would YOU, reader, like to be strong, vigorous, vital and manly once more, without an ache, pain or weakness? If you really seek and want this new vigor, this rugged manly strength, then please call at my office or write today and get my free book that you may know the whole wonderful story of this great, drugless, self-treatment, this marvellous little VITALIZER of my invention, which you wear comfortably on your body, and which sends its steady gentle, silent supply of FORCE into your nerves, blood and organism while you sleep.

Real manhood with a perfect manly strength is not only nature's own gift, but, according to my belief, may easily be within the reach of practically any man. Of course, we all know that it is the husky, vigorous, vital fellow who attracts both women and men to him, and it is he, also, who is ever sought out and who achieves the really big things of life. Sturdy, vital manhood is, without doubt, the one great, silent universal power which fascinates us all, no matter how we may argue to the contrary. Therefore, reader, I care not what may be your age, nationality or creed, whether you are married or single, whether you are a bank president or work on the farm or in the shop, nor do I care how unstrung or nervous you may feel, or what past acts may have left you debilitated and enervated, I say to you in all seriousness, if I can show you an easy, drugless way by which you may treat yourself with the object of bringing back full vigor to your organism, then I will show you the road to new hope and new manhood. A man may be small in stature, yet as strong and attractive as a giant, or he may be big in stature, yet unstrung, nervous and unmanly. It is all a question of your own vigorous strength. Therefore, let me suggest that you call or write at once, then, after reading my book, if you decide you want to try out my little vitalizer in your own case, and will write to me saying so, I will reply to your letter and guarantee to make an easy proposition which should enable you to have one of the vitalizers at once. At all events, you need the knowledge that my little book contains, whether you ever get a vitalizer or not, so please call or fill in and send the coupon.

NOTE—With special attachments my VITALIZER is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, nervousness and general ill health.

Free Self-Help Book For Men

I publish a little illustrated pocket compendium in booklet form, as mentioned above, which is meant to guide both single and married men along the road of Vigorous Health and Moral Rectitude, so they may be as vigorous and strong as the best, and may live to a ripe, healthy old age. There is a lot in this little compendium which every young or elderly man should know and can refer to from time to time with great profit to his own physical health. The booklet in one part fully describes my new VITALIZER, the great drugless self-treatment. If it is not convenient or if you are too far away to call, please write for this booklet today. It will come to you in plain, sealed envelope by return mail. Please use coupon. Office hours, 9 to 6.

Dr. M. F. SANDEN, CO.,
140 Yonge St., Toronto; Ont.

Dear Sirs—Please forward me your book, as advertised, free, sealed.

The Inventor of the Thermometer.

It seems strange to think that a little over 200 years ago, the only way there was to tell of the weather, or the atmosphere of a room, or to speak about its being hot or cold, was by one's own personal sensations.

All we need to do, from the beginning of the year to its end, is to look at the thermometer, and no matter how varying the changes may be, it informs us correctly of the state of the atmosphere whether out of doors or in.

Seventeen hundred years appears to have been a long time to wait for such a convenient little instrument; and one too, which is, of course, of interest to everybody. Having become so accustomed to its use, we, of course, are unable to understand how the people of the seventeenth century ever managed to get along without a thermometer.

To be sure many attempts were made by scientific men to produce an instrument for measuring cold, but none of them were successful. And if Gabriel Daniel Fahrenheit had not failed in business as a merchant, there is no telling how we of to-day would be speaking of the weather.

Sir Isaac Newton tried to produce an instrument that would measure heat, but he made out no better than

Watch Your Liver.

If It Is Lazy, Slow or Torpid Stir It Up By the Use of Milburn's Laxa-Liver Pills.

A lazy, slow or torpid liver is a terrible affliction, as it holds back the bile, which is required to move the bowels, and lets it into the blood instead, thus causing Constipation, Catarrh of the Stomach, Sick Headache, Langour, Pain under the Right Shoulder, etc.

Mrs. Wesley Estabrooks, Midgic Station, N.B., writes:—"For several years I had been troubled with pains in the liver. I have had medicine from several doctors, but was only relieved for a time by them. I then tried Milburn's Laxa-Liver Pills, and I have had no trouble with my liver since. I can honestly recommend them to every person who has liver trouble."

Milburn's Laxa-Liver Pills are 25c a vial, or 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

THE PLAYTIME

MAKES HAPPY HOMES

A great economist has said that the happy home is the very bone and sinew of our national life; but no home is as happy as it should be if the wife and mother is so utterly tired at night that she cannot be a cheerful companion in the family circle.

The greatest labor saver, the best conservator of health, strength and cheerfulness is the "Playtime" Washer. It takes the tired feeling out of wash-day. It is an efficient helpful servant that never tires and is always ready. As a power machine it is specially adapted for the country where gas, gasoline, steam engine or windmill power is available.

See the "Playtime" at your dealer's or send to us for full information.

The Johnson-Richardson Co. Limited, Montreal

You judge a man not by what he promises to do, but by what he has done. That is the only true test. Chamberlain's Cough Remedy judged by this standard has no superior. People everywhere speak of it in the highest terms of praise. For sale by all dealers.

Halley, another noted astromer who failed in a like attempt.

After Fahrenheit, the name which every thermometer bears, and who was a native of Dantzig, failed in business, he turned his attention to mechanics and chemistry. Fahrenheit was a poor man and had lived a very obscure life, and while he had a taste for the higher learning he had never been able to gratify his love for study in any particular branch.

Now, however, he began a series of experiments for the production of the thermometer. And it is owing to his determination to succeed, and to his loyalty to the conviction that he must give to the world the instrument which has proved so serviceable to mankind, that we are enabled to have a definite way of speaking of hot, or very hot; cold, or very cold.

For his first instrument Fahrenheit used alcohol. But before long, he became convinced that a more suitable article to use in the glass tube was a semi-solid mercury.

By this time, about the year 1720, Fahrenheit had moved from Dantzig to Amsterdam. And here, in the capital city of Holland, he made the mercury thermometers. And all the thermometers which ever since have been produced were made like the original one that Fahrenheit fashioned in Amsterdam over two centuries ago.

The basis of Fahrenheit's plan was this: "To work on the tube the two points respectively at which water is congealed and boiled, and graduate the space between." He commenced with an arbitrary marking, beginning with 32 deg., because he found that the mercury descended 32 deg. before coming to what he thought the extreme cold resulting from a mixture of ice, water, and sal ammoniac. In 1724 he published a distinct treatise on the conclusions that had resulted therefrom.

Not long afterwards Celsus, a Swedish scientist, produced the centigrade thermometer, which suggested the graduation of 100 deg. between the freezing and boiling point. Reaumur, a French scientist, also proposed another graduation, and one which has been accepted by the French.

But Fahrenheit's scale, with 32 deg. as freezing, 55 deg. as temperate, 96 deg. as blood heat, and 212 deg. as boiling point, has been accepted, and is being used, by far the largest part of the civilized world.

Fashion Notes.

Nightgowns of pink and blue batiste are in favor.

Cashmere shawl designs are coming back with printed taffetas.

Baroque pearls ornamented with jewelled wreaths make charming hatpins.

The best tailored suits for sports wear are those with an extra large armhole.

Large women should avoid the bright colors; modified colors are the safest for them.

There is no diminution in the liking for ratine; if anything, it increases in popularity.

For negligees the favorite colors are canary yellow, green, blue, pink coral and poppy pink.

The boudoir caps are now worn with any type of negligee dress, from bed jacket to tea gown.

Bruce's Seed Oats

Bruce's Conqueror. A new variety from Northern Europe, very heavy yielder, straw is strong, of medium height, grain is plump, thin skinned, pearly white, and makes splendid Oat Meal. It is hardy and ripens medium early. Peck 40c, bushel $1.25 here.

New O.A.C. No. 72. A new variety, of exceptional merit, an immense yielder and of fine appearance. It is a branching White Oat, early, and the straw is good and strong, the hull is thin and the grain weighs well. Peck 60c, bushel $2.00 here.

New 2¼ bushel cotton bags 30c each extra.

Prices of above postpaid, 1 lb. 30c, 2lbs. 55c, 3 lbs. 80c, 4 lbs. 95c, 5 lbs. $1.10, 6 lbs. $1.25.

We can also offer Daubeney, Americau Banner, Siberian, Abundance, Scottish Chief and Green Mountain, also Black Tartarian and Black Victor.

502.6 Bushels Potatoes

From One Acre of Ground

TWENTY DIFFERENT FARMERS in 20 different parts of New England competed the past year in growing potatoes. The crops were widely separated as to climatic and weather conditions. Each one planted, cultivated and took care of his crop in his own way; *but all used*

Bowker's Fertilizers

And No Other Dressing

The winning crop was 502.6 bushels. The average of the twenty crops was 322.8 bushels. The average yield in New England is 131.6 bushels, and for the United States 89 bushels. Our crop-growing contests of the past four years have been so fairly and accurately conducted that they have been accepted everywhere as authentic. Henry Wallace, Editor of Wallace's Farmer, writes: "There is no guesswork about them."

Send for our Book of the Contest. Also tell us what your crops are, and your fertilizer requirements and we will send you our helpful book on Plant Food and our new Illustrated Catalogue.

Learn To Play

Piano, Organ, Violin, Mandolin, Guitar, Banjo, Cornet

New Methods, Wonderfully Simple, Easy and Rapid

COMPLETE INFORMATION FREE

Let us tell you of a Wonderful, New and Simple Method by which young and old may learn to play by note the piano, organ, violin, guitar, mandolin, banjo, cello, cornet or other instrument. No knowledge of music is required. Those who have found old methods difficult or impossible, learn quickly and easily by this wonderful and new method. A few minutes of your spare time, evenings, will soon make you capable of entertaining your friends, teaching others or playing in public. Valuable alike, to the beginner and to advanced pupils who wish to improve.

Thousands of pleased pupils throughout the United States and Canada praise this marvelous, yet extremely simple and easy system. Send your name and address to us today for complete information, booklet and reference all FREE. Tell us what instrument you would like to play. A post card will do. If two members of the same family desire information about different instruments, please explain clearly. Address

Construction of Silos.

(Continued from page 421)

nailed are half-inch elm, six inches wide. These are placed around the outside of 2x4 scantling which are used as the studding, and the inside of the entire silo is lathed and plastered with a cement plaster. The laths used were of elm cut in strips 12 feet long. This construction allows of a five-inch air space between outside hemlock sheeting and inside cement plaster. The bands of elm are placed about two feet at the bottom, and from three to four feet apart at the top. Besides the cement used in plastering five bushels of lime and one-half bushel of hair were required. The plaster when finished is about one-half inch thick. The studding, is lapped one length upon another and is placed 14 inches apart from centre to centre.

"The entire plastering of the inside cost a little over $15. To do it a platform was hung from the top of the silo with ropes and lowered as required, the plaster being pulled up with ropes and pulleys with a large pail. Bracing with 2x4 scantling is done at the bottom and about the centre of the silo. This makes a cheap silo, and one in which silage has kept the past winter in first-class condition. While a little frost gets into the silage not nearly so much has been found therein as where silage is kept in an ordinary stave silo or in a cement silo. The elm bands are doubled and joints broken so that the whole makes a very strong silo, and the owner states that if the building should blow down he believed it would remain intact, as all the staves are nailed securely to the elm bands. This silo sits on a cement foundation eight feet deep.

"Several similar silos were mentioned, among which was one 55 feet high and 14 feet in diameter, which has been filled six times and is still giving the best of satisfaction. It might be worth while for some of our readers contemplating building a silo to look further into this type of building. It is advisable to have the outside sheeting cut quite narrow, so that if the lumber happens to be green shrinkage will not be great enough to draw the tongues from the grooves."

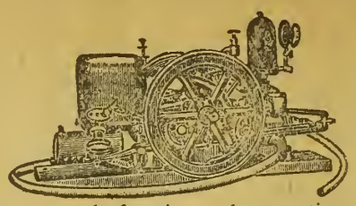
THE CEMENT SILO.

For a silo that is durable and satisfactory in every respect we would recommend the cement silo and the following description of one built by J. H. Manchester, and described in these columns a year or two ago will be of interest to the readers who asked for this information.

"I had planned on building a silo for a number of years, and considered the different makes from every standpoint and then came to the conclusion that a reinforced concrete silo had every good point claimed for other makes, and that, while the initial cost of a wooden silo might be less, the repairs that would surely follow would more than cut out the original saving, while the concrete one would never need a cent for repairs and would keep on improving.

We built our reinforced concrete silo in August, 1912, using Canadian Cement. It is circular, 12x30 ft., 8 inch walls, ten of the 30 feet below the ground with a square pitched shingled roof, built at the west end of a 30x100 stock barn. It is joined to the barn by a chute 3 feet wide, the door from the silo opening into it, and chute doors opening into gangway between two rows of cattle. There are three windows in chute on south side, and window in gable of the silo roof to receive blower pipe when filling. The moulds were made by a local wheelwright. They consist of two circles, one for the inside and one for the outside, and each circle is di-

Protect your trees and garden



A Fairbanks-Morse Spraying Outfit offers you the most effective and economical means of destroying insects and of curing and preventing plant and tree diseases.

The spraying machine illustrated here can be used for practically every spray use on any farm, and will quickly pay for itself in improved crops.

You can buy a Fairbanks-Morse or Gould Spraying Pump, from a brass hand pump costing a few dollars up to an engine-operated, truck-mounted outfit of the highest efficiency.

Send for free catalogue of spraying outfits and appliances. It contains much valuable information, tells you what to spray, what chemical compounds to use, how to prepare them, when to do the spraying, etc. We are the largest Canadian dealers in farm engines, scales, and mechanical goods of every kind.

Do You Need a Good Holstein Bull

We have three, 14 to 16 months, good lookers, good condition, well bred and the right age for service, also females all ages at reasonable prices.

LEA & CLARK, VICTORIA, P. E. I.

vided into four sections. The sections consisted of one inch boards, five inches wide and three feet long, bolted with small bolts on two bands of ⅜x2 inch iron, the top band within six inches of top of the boards, and the other six inches from bottom. The ends of the band iron turns out where they join each other that they may be bolted together. The bolts have a continuous thread cut on them and four nuts on each—two between the band iron and one on each end of the bolts. These nuts are to tighten and loosen the form when desired. There are also half-inch bolts put through the wall, three in the bottom and three in the top of each section and through the band iron. When the form is raised these bolts are taken out and the form loosened by slacking the nuts on the bolts, where the sections join. To raise the form, we stood four uprights on the inside of the silo where the sections meet and about six or seven feet above the wall, we nailed on planks, allowing the planks to project over the wall; we fastened a small pair of blocks to the ends of these planks. A man at each rope could raise the form easily. After which the bolts were again tightened. With a little care, anyone can build a silo as true and smooth as a crock. We used Canada cement, sand gravel and broken stone for the floor and foundation a 1, 3, 7 mixture; for the walls a 1, 2½, 4½ mixture; for finishing floor an a 1, 2 mixture and for painting silo inside and out a 1, 1 mixture.

Our mixing board, 12 ft. x 12 ft. was double boarded and level, built close to the excavation. We first put on sand, 2½ barrels (by wheelbarrow means) spread it out and put on four bags cement and mixed together dry then open out and filled centre with water and worked it together into a paste, then put 4½ barrels broken stone and gravel, and when stone and gravel was covered with mixture it was ready to place. After we had about 9 inches in moulds, we put in 4 strands of No. 8 coiled wire, twisted together, letting it come on the outside of the vertical reinforcement, which consisted of the same number of wires and placed every 30 inches, about 3 inches from the outside mould, the horizontal wires were placed every 3 inches for the first 21 feet and every 12 inches for the last 9 feet.

Had the silo been built all above ground more steel would have been necessary for the first 20 feet. A ten quart galvanized pail was used for handling cement and we used a spade for working and keeping stones from side of forms. Four men mixed and placed concrete for each ring of 3 feet in five hours. We left it in position for three days, before raising forms.

The only tools used were two shovels, one spade, two hoes and one wheelbarrow and when completed the silo cost me, considering the building itself, the moderate amount of $304.87 as follows:

35 bbls. Canada Cement $1.95	$68.25
9 loads sand, $1.00	9.00
20 loads gravel, $1.00	20.00
4 cwt wire, $2.60	10.40
4 windows, 2nd hand, $1.00	4.00
5M Shingles, $2.25	11.25
Boards, scantlings, nails,	34.37
Labor for concrete work, 262 hours @ 15 cts.	38.30
Raising form and staging	39.30
Cost of form	45.00
Excavating	10.00
Building chute, roof and shingling	12.00
Matched 2 in. pine for doors	5.00
Total	304.87

We had no experience with concrete work, neither had we seen a silo of any kind and if any farmer wishes to undertake to build one I believe he can do so for the amount named, as we did. If we were doing the like again it is possible to cut our expenses considerably, as we have a lot of lumber left and the forms that cost $45.00 are as good as ever.

The DeLaval Dairy Supply Co., occasionally advertise a very good silo in these columns.

At The Fisher Vocational School, Woodstock.

The first week of the short course at the new Agricultural School at Woodstock, N. B., March 9th to 14th was devoted to horticulture in its various branches. The attendance was good, 52 regular students registering at the principal's office while a number of others who were especially interested in certain subjects came in for the lectures or periods of work devoted to those subjects. The evening lectures were nearly all illustrated by lantern slides and were quite largely attended by the townsfalk of Woodstock. A keen interest was shown by students in all phases of the work and many expressions of appreciation were addressed to the principal and to the instructors. In addition to the regular staff of the Agricultural Department, special instruction was given by the following: F. C. Nunnick, on "The Work of the Commission of Conservation," R. A. Fillmore on "The Propagation and Care of Nursery Trees," S. L. Peters on "The Packing of Fruit and Fruit Packages," and Major O. W. Wetmore on "Vegetable Gardening and Small Fruits."

In connection with the work on the grading of apples, a judging competition was held and participated in with great interest. The following were the prize winners:

1st—B. J. Heartt, Woodstock.
2nd—B. T. Griffith, Woodstock.
3rd—E. M. Pringle, Stanley, York Co.
4th—Basil Palmer, Waterville, Carleton County.

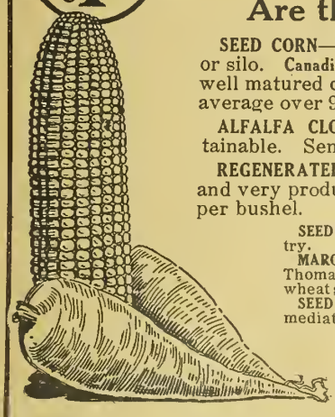
D & F High-Grade Seeds

Are the Best Money Can Buy



SEED CORN—Best Flint and Dent varities for either crop or silo. Canadian Grown and will give the largest amount of well matured corn to the acre. Germination tests to date average over 95 per cent.

ALFALFA CLOVER TIMOTHY—One grade only, the best obtainable. Send for samples.

REGENERATED SEED OATS—Six splendid varities. Early and very productive, with grain weighing 40 lbs. and over per bushel.

SEED BARLEY—The kinds proven best by test for this country.

MARQUIS WHEAT—Winner of $1,000 prize given by Sir Thomas Shaugnessy at the New York Show for the best wheat grown on the Continents of North and South America.

SEED POTATOES—Seven high grade varities. Early, intermediate and late in any quantities.

SUPERLATIVE SWEDE TURNIP — Richer in saccharine than any other Swede in cultivation.

D & F catalogue on application.

DUPUY & FERGUSON,
38 Jacques Cartier Square, Montreal

POULTRY

Breeding for High Records.

In order to have a hen average 200 eggs, in a flock, it will be necessary to have a number of individual layers that will reach 250 eggs or more, for each hen would not lay 200 eggs and then stop, and a great many would be somewhat short of that amount. It would be the same to secure a 150-egg record; quite a number would necessarily have to lay 200 eggs each.

While a judicious breeding for good records is to be commended, at the same time it is more advisable to have our hens average 120 eggs a year, a flock record, and remain in good, sound health, than it is to have their system drained of vitality in the race to pass the 200 mark.

If all the energies are to be put in the direccion of eggs, what will become of the supply of meat? If we spend our food and attention in the direction of creating ideal meat carcasses, we certa nly cripple our egg yield, and vice versa. Furthermore, if our hens are bred up to the top notch of egg production, surely the fertility will be hurt, and there will be weak and puny chicks.

For years the plan of the writer has been to each year pick out his best hens to breed from. These are birds that not only show good characteristics of the breed, but also have done good laying, as pullets. Trap nests have been the guide, and these are used, as a rule, from January 1 to June 1; and again from October 1 to the end of the year. Occasionally they are used in some pens the entire year, but that is done only where a special test is made of a new selection, or a new breed. What we wish mostly to know is not so much how many eggs a hen will lay in a year, as how many she will lay in winter when the prices of eggs are the highest. From the latter stock we breed. During the summer months the traps are discarded, and only open nests are used.

Now, by selecting out best cold weather layers and breeding from them, we each year increase our winegg supply. There is more money in it, and it is a fact that our hens, in consequence of our careful selection of winter, have become poor summer layers, a condition we would rather have them in than to have a great year-round record and a poor constitution in consequence.

By the use of trap, and by careful selection of the breeding stock, any breed can be bred up to prolific work.

Now, where the great danger comes in is this ambition to secure 200 egg layers as a flock. The stock is quite frequently forced by condiments, meat and other articles of a highly stimulating nature. While it will in many cases produce the eggs, it will at the same time bring an early decline. But by working for a stronger winter egg crop we are getting the bulk of our eggs at a certain season, and the hen has the rest of the season to recuperate.

Another method adopted by some of those ambitious for great results, is to hatch the eggs from one or more phenomenal layers, and mate up the offspring, brothers and sisters, and repeating for two or three years. We do not know of a more sure way to deteriorate the stock than in such inbreeding. It may bring good results the first year or two, but it cannot hold out, and the collapse will be as it in the cases of prize fighters, which we have used as an illustration.—Poultry Advocate.

Chicks Should be Hatched Early.

As the hens on the farms of the country become more and more mixed with pure bred stock and begin to lay better, the period at wh ch broody season is set back weeks later and later in the year, until now farm flocks produce hens which keep laying later in the spring, and the broody season is set back weeks later than it was thirty years ago. As a result early-hatched chicks of to-day would have been called rather late-hatched in those days. Another results that we do not get our chicks out early enough for them to make a good growth before the extremely hot days come, and they do not make the rapid and perfect growth they would if they had been hatched in the first half of April. I have found at shows a great many birds hatched last spring which were under weight.

Another mistake that a great many owners of farm flocks make is in the eggs they use for hatching. The hen that lays eggs in winter is the one we want to use for producing eggs for hatching, as pullets from these hens are more likely to make winter layers than pullets from summer laying hens. If a hen does not make a pretty good record before March 1, it is impossible for her to make a good record as a layer. Watch the winter layers, and about the time hatching should begin pen them by themselves where they can have a little extra care, and be kept laying. Use their eggs for hatching, and the chicks will have an inherited tendency to be like their dams, the pullets produc ng eggs in winter. As a rule a dozen eggs produced in December or January is valued at about three times as much as a dozen laid almost any any time after Easter. I would undertake to manage any farm flock and within three years produce pullets which would lay an average of ten dozen or more eggs in a year. A flock of this kind is worth having. The average now is about seven dozen eggs, something like six dozen of these being produced at a time when eggs are falling in price.—Miller Purvis.

Egg Fertility.

If you set the incubator very early and did not get the number of fertile eggs you felt that by rignt was due, don't blame the incubator. The incubator has nothing to do with eggs that on test show as clear as if laid yesterday. The fault lies in the flock. If the flock has been laying heavily through the winter, or under some conditions even after moderate laying, you are going to have a large per cent of infertile eggs for the early hatches, and if the pullets have contributed their share of the eggs, then the fertility will be pronounced. If there could any way be found to know a fertile egg before setting hens and incubators, what a saving of eggs there would be to put on the market. The writer has learned to be a little careful about setting these early eggs. While not every spring are the early eggs as provokingly infertile as they are other springs, yet it is a good idea to not waste too many eggs in the incubator or under a dozen hens until you have tested some first. A few brooded under the hens will, if broken after three or four days, give you an idea about how high the fertility is running. Some flocks show low fertility every spring until the chickens get far out on the range, then the fertility shows strong. The eggs in a cold spring, especially the February and early March eggs will hatch better from pens in which you have turned one good male with even as high as fifteen hens than if you put a dozen males with from seven to eight hens apiece, and allow all to mix in the houses and yards.

How Long to Keep.

An egg has been known to hatch after being kept for six weeks. Indeed, longer time than this is told of. I cannot speak for the truth of a longer time; neither can I of a good hatch, or even a medium hatch, if kept six weeks. Usually, if the chicks come out of eggs set at this age, they come weak and small. The reason for this is because of the tendency of cell life to die after a certain time, and in the egg this is hurried by the evaporation of moisture in which the germ swims. Three weeks in winter or early spring is usually too long to keep eggs, although they will keep in hatchable state better then than later. I do not like to keep eggs over fourteen days, as over this time they are slow in starting, and thus slow in coming out. A slow hatch is seldom a satisfactory hatch.

Eggs that are old will do better under hens than in an incubator. I want all the eggs I set in an incubator not to be over ten or eleven days old. Eggs hatch best for me that are not over one to four days old. This is the rule, although from a healthy,

Your Oven Gains by Our Oven Test

PURITY

Your oven becomes a certain producer of more bread and better bread.

We can promise that.

For from each shipment of wheat delivered at our mills we take a ten pound sample. We grind it into flour. We bake the flour into bread.

If this bread is high in quality and large in quantity, we use the shipment. Otherwise we sell it.

There is no guess-work about our promise of more bread and better bread from flour bearing this name.

RED ROSE TEA "is good tea"

An Income For the Farmer's Wife

THE wife of every farmer should have her own income and her own bank account.

And it does not matter how busy you are in the home, or how little time you have to devote to the raising of poultry we can show you how you can make a good income and build up a substantial bank account by poultry raising the Peerless Way.

We can show you how to be independent of the money your husband gets for his crops and other farm produce, so that when you wish to buy clothes, or take a shopping trip to town, you can just stop at the bank and draw all the money you will require.

The Peerless Way Makes Poultry Pay

If you know the right way to raise and keep poultry it requires very little outlay or money, and takes but very little of your time. The right way is the Peerless Way, that is, by hatching the eggs in a Peerless Incubator and rearing chickens in a Peerless Brooder.

Send For Booklet

We have prepared a book for you entitled "Money In Eggs," if you would be interested in learning how other women like you are making independent incomes from the sale of eggs and plump chickens. Experience is not essential. We are practical poultry raisers ourselves and will furnish you all the information necessary to make your chickens pay you handsome profits.

Fill in and send this coupon now for full particulars.

strong flock, and in warm weather, I have had at times good hatches from the two-week-old eggs. The reason that eggs from a large flock hatch better than from a small flock, all other things being equal, is because the eggs are fresher when set. The fresh egg hatches from six hours to twenty-four earlier than the several-day-old egg.

Spring Cold Storage.

When the grass comes, then comes the largest number of eggs. Eggs are wanted at this time for hatching purposes, ae well as for the market, and they are wanted in plenty for the market, for April and May are the logical months to put eggs in cold storage. This is not a questionable undertaking at all; it is just as honest as putting up fruit or meat or anything else for future use. About 15 per cent of the eggs put on the spring market go into cold storage. The cost of storage is not heavy. If in good condition and properly handled, these eggs will stay good for several months. It is not the cold storag itself that is in question; it is the combinations of storage men that, taking advantage, make the price soar when they came out.

Parcel Post in Relation to Poultry Industry.

Many of us do not realize the value of, and what a great boon the new parcel post system is going to be in helping to market our poultry products. For such a long, long time we have been hearing the cry that the middleman was getting all the profits. I am not going to say anything about the middleman, as he is a very necessary person, and we cannot get along without him, but now is the opportunity for the producer and consumer to be brought close together. We shouldn't lose a minute in taking advantage of this opportunity, as it means greater satisfaction all around. I am very much interested in the Toronto Housewives League, which is doing so much for our city cousins in distributing country produce at reasonable prices. Surely such organizations as this and the new parcel post will do much to solve the problem of expensive living. Just the other day a friend of mine said she would give anything if she could get her butter, eggs and poultry direct from tne country, but the trouble was how was she going to locate the farmer?

Now is the time for the farmers' wives to get their city customers, who will be more than glad to pay good prices for first class produce, when it can reach them without delay. With such a facility as this, we can mail direct to our customers new laid eggs, and the next day they will be relished for breakfast, when they are not more than twenty-four or forty-eight hours old.—Farmer's Wife.

A Few Hints on the Care and Marketing of Eggs.

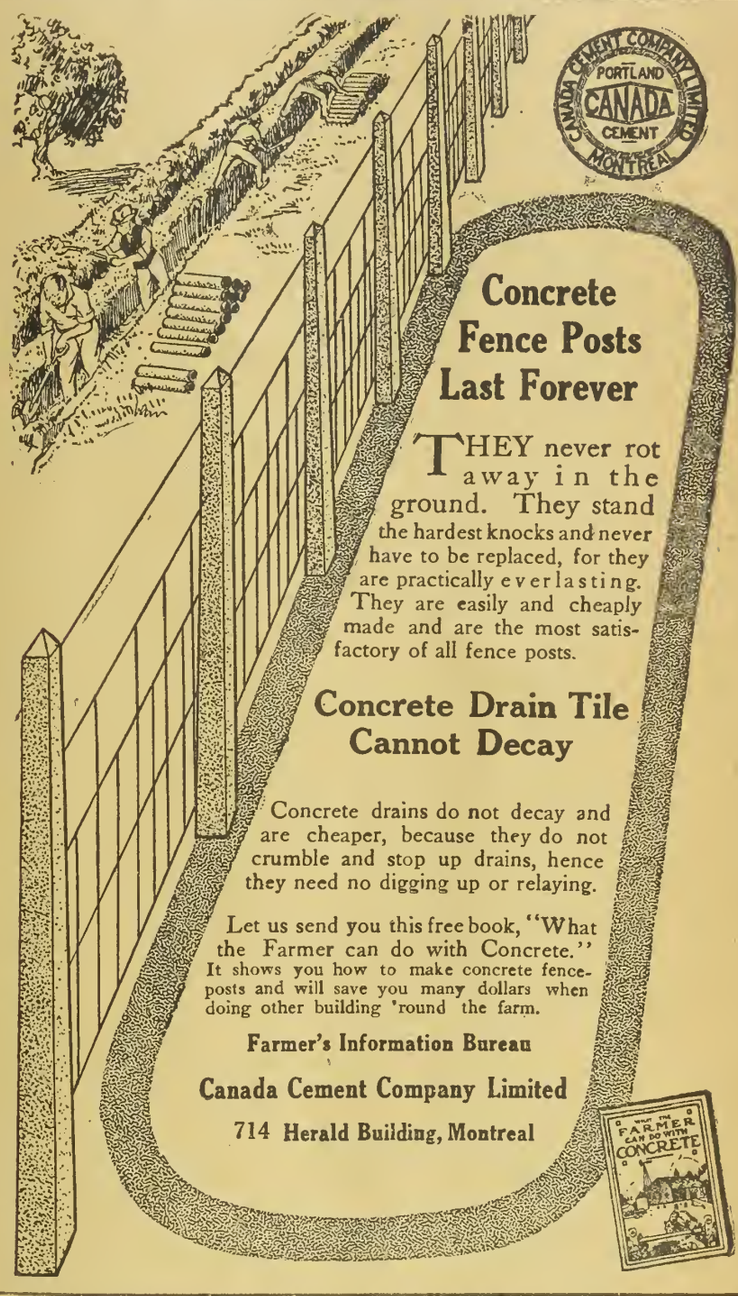
1. Keep the nests clean. Change the straw, or shavings, once a month.
2. Gather the eggs twice a day.
3. Keep the eggs in a coal, dry place.
4. Never keep eggs near onions, fish, kerosene or anything with a strong odor, as the shell is porous and they absorb odors.
6. Keep the extra small and extra large eggs at home, as they will spoil the appearance of a nice, uniform shipment.

130-Egg Incubator and Brooder Both For $13.90

FREIGHT AND DUTY PAID

If ordered together we send both machines for only $13.90 and we pay all freight and duty charges to any R. R. station in Canada. We have branch warehouses in Winnipeg, Man. and Toronto, Ont. Orders shipped from nearest warehouse to your R. R. station. Hot water, double walls, dead-air space between, double glass doors, copper tanks and boilers, self-regulating. Nursery under egg tray. Especially adapted to Canadian climate. Incubator and Brooder shipped complete with thermometers, lamps, egg testers—ready to use when you get them. Five year guarantee—30 days trial. Incubators finished in natural colors showing the high grade California Redwood lumber used—not painted to cover inferior material. If you will compare our machines with others, we feel sure of your order. Don't buy until you do this—you'll save money—it pays to investigate before you buy. Remember our price of $13.90 is for **both** Incubator and Brooder and covers freight and duty charges. Send for FREE catalog today, or send in your order and save time.

Write us today. Don't delay. **WISCONSIN INCUBATOR CO., Box 326, Racine, Wis., U. S. A.**



Concrete Fence Posts Last Forever

THEY never rot away in the ground. They stand the hardest knocks and never have to be replaced, for they are practically everlasting. They are easily and cheaply made and are the most satisfactory of all fence posts.

Concrete Drain Tile Cannot Decay

Concrete drains do not decay and are cheaper, because they do not crumble and stop up drains, hence they need no digging up or relaying.

Let us send you this free book, "What the Farmer can do with Concrete." It shows you how to make concrete fence-posts and will save you many dollars when doing other building 'round the farm.

Farmer's Information Bureau

Canada Cement Company Limited

714 Herald Building, Montreal

FARMERS—

come to our store and let us show you *real high grade* Fertilizers, and how you can raise better *grain* and *hay* Crops. We can show you how to prepare a properly balanced Fertilizer suitable for your soil. Most Crops take far more POTASH from the soil than Phosphoric Acid, therefore, it is necessary to use

HIGH GRADE POTASH FERTILIZERS

to insure the biggest and best crops—it assists in better reproduction of seed—better grain—and stiffer straw. For Potatoes, Roots and Vegetables POTASH is even more necessary.

From 400 to 600 lbs. per acre of high grade fertilizer is a good dressing. Potash, Nitrate of Soda, Acid Phosphate and Basic Slag for sale at lowest prices in bag, ton or car lots.

A. R. WETMORE, .- - CLIFTON, N. B

Think of Spraying, Think of SPRAMOTOR---
Think of Spramotor, Think of SPRAYING!

What is going to increase the yield from non-sprayed trees, row crops and vineyards? Spraying!

Is it ever too late for spraying? Not while trees, row crops or vineyards still bear. While there's life there's hope—of better crops.

What proofs exist of the benefits of spraying? There are actual proofs at almost every agricultural exhibition and country fair. See exhibits of sprayed and unsprayed fruit side by side. Notice the stunted, retarded development of fruit and vegetables which have not been sprayed. See the blight, caker, worm-eaten appearance and meagreness of grown things that have been left to the mercy of pests and parasites.

Then contrast them with the ***protected, sprayed,*** product of field and orchard. Here you see plump, fully developed specimens brought to perfection unhampered in their growth by gnawing insects, rotting fungoids and withering disease.

There are proofs for you even if you never attend a Fall Fair in your life. The farm papers in every part of the country are full of photographs showing sprayed and unsprayed crops side by side. There are articles by the score published every year, urging spraying for better results, and giving the actual experiences of men who have tried both ways, offering freely the advice of the foremost authorities in the land.

When You Are Ready to Spray Get a Spramotor

Realize what the following means:—***We make Spraying Machines and nothing else!*** Perfecting the SPRAMOTOR has been our whole concern since we started in business, years ago. There has been no side issue to distract, no other line of business to claim part of our attention and engage part of our thought.

We have labored to some purpose, because today we present in the SPRAMOTOR, the highest type of efficient spraying outfit on the market.

Do not think we make this statement without the best of reasons, The SPRAMOTOR has been awarded over one hundred Gold Medals and First Awards at the hands of competent, critical judges. For instance:—

First award at Canadian Government Spraying Contest, Grimsby, Ontario, (17 Entries).
First Award at International Exhibition, Glasgow, Scotland.
Gold Medal at Pan-American Exposition, Buffalo, N. Y.
Gold Medal at Canadian Industrial Exhibition, Toronto, Ont.
Gold Medal at Halifax Exhibition.
Gold Medal at St. John, N. B., Exhibition.
Gold Medal at Western Fair, London, Ont.
Gold Medal at Central Exhibition, Ottawa.
2 Gold Medals at Council Bluffs, National Horticultural Congress.

The above results come from being ***Specialists*** in spraying machine construction and manufacture. We do not make a line of pumps or gasoline engines or windmills in addition to our spraying outfits. No! SPRAMOTOR gets all our attention and all the time we have for experimentation in the endeavor to still further perfect our output.

The judges at all the above exhibitions and at many others where SPRAMOTORS carried off first honors, were able, impartial men who gave credit where credit was due. Yet it is not from these men that the highest praise of SPRAMOTORS comes. It is from men out in the field and the orchard, men who actually use our machines year by year in betterment of their crops, men who have *seen* the improvement of the trees and plants upon which they depend for their livelihood.

It is a wise man who buys a SPRAMOTOR. It is a wiser man who gets all from a SPRAMOTOR that it will perform. This is the man who paints and whitewashes with his SPRAMOTOR during the idle season, disinfecting, fireproofing and brightening up his barns, hen houses, stables and outbuildings generally. You can apply lime, whitewash and paint, better, quicker and far more economically with a SPRAMOTOR than in any other way.

We Give a Written Guarantee With Every Spramotor Sold

For your protecrion and to ensure that every purchaser of a SPRAMOTOR will be a SPRAMOTOR booster, we bind ourselves to this condition:—***Every machine we ship is to be exactly as represented or money refunded***

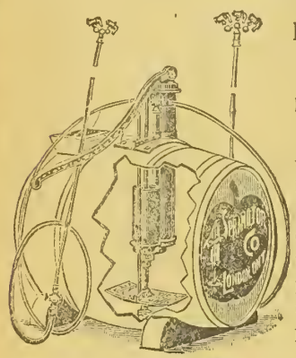
Furthermore, we undertake this:
All Spramotors are guaranteed for life. ***Any part proving to be defective in either material or workmanship will be replaced free of charge.***

Now, since we do not wish to be troubled with constant repairs and changing of parts, you can see how it pays us to test every machine carefully before it goes out.

There is a SPRAMOTOR for every need for the small farm as well as the largest

PRICES FROM $6 TO $350

We make outfits in all sizes and capacities, from a Hand SPRAMOTOR costing only $6 to the $350 gasoline machine. No matter which SPRAMOTOR you buy, be assured that you are getting ***the best spraying outfit on the market*** at the price.



HAND SPRAMOTOR OUTFIT NO. 117

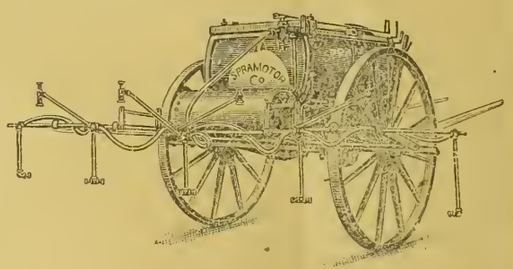
For High Spraying 1000 trees or less

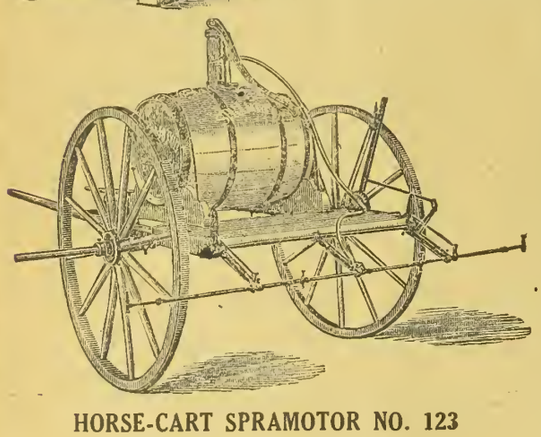
This machine comes to you with house lines, each 10 feet long with couplings attached, patent hand valves, two bamboo extension rods with inside brass tube, brass cupped ends and patent drip guard, two double nozzle clusters, everything complete and ready to work $26.oc.

HORSE-POWER SPRAMOTOR

For all forms of spraying on a large scale.

With this outfit, the grower can meet every spraying need, whether row crps, vineyards or orchards. The horse does all the work, operator merely has to direct the spray. Twelve nozzles may be operated at once, spraying with a searching pressure of 150 lbs Extra nozzles may be added for weed destruction and operated at 100 lbs. pressure. For full description of this splendid outfit see page 69 of our catalogue. Price complete as shown.....$140.00 to $170.00





HORSE-CART SPRAMOTOR NO. 123

Can be arranged for all kinds of spraying.

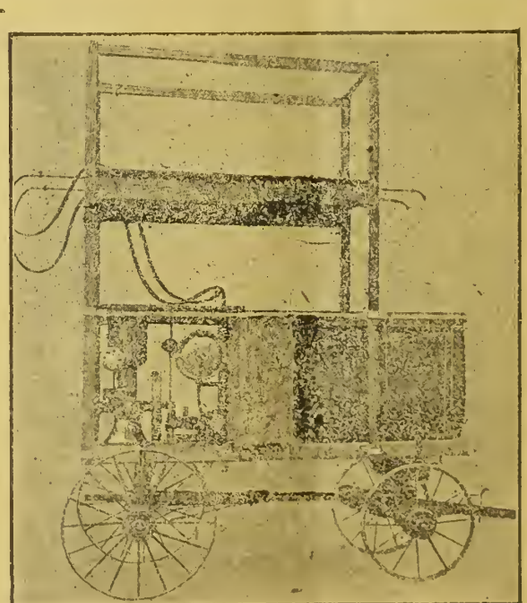
We built this machine to supply the demand for a good, moderate-price rig that could be used by hand, as many growers need a spraying outfit suitable for all kinds of work—row crops, orchards, vineyards, potatoes, etc., also painting and whitewashing. Outfit consists of 50 gal. cask on substantial hardwood frame, with 52 inch wheels. Equipment varies according to needs specified (see catalogue, page 57.) Prices from $50 50 to $82.45.

GASOLINE SPRAMOTOR Model C.

The highest type spraying outfit made today.

Driven by double-acting, single pistou motor of original design, (all parts standardized and renewable). 12 gallon Air Chamber relieves working parts of motor and pump of all shock and jar. Automatic regulator placed on pump and gear frame provided with emergency valve set at 250 lbs. pressure. Spraying deck is three feet wide by six feet long, enclosed by rail 34 inches high. Everything about this outfit is the result of years of practical experience and efficient work in the field.
Complete outfit consists of the following:—

4 inch platform, 200 gallon tank, caboose with SPRAMOTOR, geared jack, automatic regulator, 12 gallon air chamber, strainer, agitator, emergency valve, two lines best 300 lb. hose and couplings 12 feet each, two leakless stopcocks, two 10 ft. bamboo rods with drip guards, two 4-nozzle clusters, derrick, 2½ H. P. hopper-cooled engine (attached) and low down waggou with heavy iron 4-inch wheels. ***The whole gaaranteed for the life*** of the outfit against defects in materials and workmanship. Price complete and ready to run.....$340.00



THESE FOUR MODELS are simply representative outfits chosen out of our entire range. There are dozens of others. There is a spraying outfit in the SPRAMOTOR line that will exactly fit your requirements, and we'll sell it to you at the same price as you would have to pay for an inferior machine.

FREE While you are thinking about it, today, write us stating your exact needs in the way of a spraying outfit. This will not obligate you in any way. By return mail we will send you a copy of our valuable, illustrated treatise on "Crop Diseases" without charge.

Fertilizer Analysis.

(Continued from page 411)

zer, the cost of manufacturing is spread over a greater amount of fertilizing material thereby reducing the cost per pound of plant food.

High grade fertilizers are generally much more efficient owing to the larger plant food content. In many cases fertilizers have been found unsatisfactory simply because a light application of a low grade fertilizer was used. The trouble was that not enough plant food was furnished.

Take the following example of a low grade fertilizer.

Plant Food	Percent	Pounds Per Ton.
Nitrogen	1.64 p.c. ...	32.8
Avail. Phos. Acid	8 p.c.	160.
Actual Potash	2 p.c.	40.

At the rate of four hundred pounds per acre this fertilizer furnishes 6½ pounds of nitrogen and 8 pounds of potash in both cases less than is those circumstances, profitable refound in one ton of manure. Under sults can hardly be expected. However, by using a fairly heavy application of one of the better of the medium grade fertilizers, profitable results are to be obtained.

In buying fertilizers the mixtures should be selected not according to the name of the brand but according to the analysis. Keeping in mind the fact that high grade mixtures are more economical as well as more efficient than the low grade mixtures.—E. A. Lods.

The in Foal Mare.

As the period of gestation varies in individuals, and sometimes in the same mare in successive periods, no one can state with reasonable preciseness when foaling will take place.

The approximate period is usually stated at 11 months, or 330 days, and it may be most safely stated that it will vary from 322 to 346 days. In extreme cases foaling has been delayed until 400 days have elapsed, and first pregnancies often last a year. Where parturition is delayed it is often accepted as an indication of a male foal.

A farmer who, in his anxiety to give intelligent care to the mare that he believes is in foal, wishes to register the earlies symptoms of pregnancy, should, says Mr. H. W. Potts, in the "Agricultural Gazette" of New South Wales, on the cessation of oestrum or heat, note any enlargement of the abdomen three or four months after, although this is not always noticeable, particularly with fillies. A slight falling beneath the loins and hollowness of the back may be present, or the udder may be observed to change in shape, becoming rounded, firm, and free from wrinkles, and the teats more prominent. These changes in the udder come and go during the period of gestation. A steady increase in weight daily after the fourth or fifth month is a sound indication, as well as the swollen and reddish state of the vaginal mucous membrane.

After the seventh or eighth month the movements of the foal may be detected by the hand or fist being pressed firmly against the abdominal wall in front of the left stifle. An examination after the mare has had a drink, or during feeding, will find the foal moving in the womb.

DURING GESTATION.

Treatment during the period of gestation must be directed on common-sense lines. A draught mare may be given steady work up to within a few days of foaling—in fact, she is all the better for it—but a walking pace should not be exceeded, and any strain or strenuous effort should be avoided, especially as the

AN EDITORIAL

which appeared in the "American Swineherd," July, 1913, the leading paper of the United States on swine raising.

"Successful Pig Feeders."

"A number of leading expert pig feeders, in giving their method of feeding and handling pigs to protect their health and increase their growth rapidly without fattening them and preventing scours, which is very necessary to the prompt and rapid growth of the pig, was brought about by feeding a small quantity of International Stock Food.

Men like Lucien Arbuckle, who has been called the champion pig raiser because of his ability to carry the pig over his pighood, without losing his baby fat, into his shoathood, uses regularly for the purpose of protecting the health and forcing the growth, International Stock Food.

Another one of the champion pig feeders and developers who puts them to the front and meets with success is Charles Kellar, of Newark, Ohio, and from his long experience has found that International Stock Food is a dependable and reliable aid in producing pigs. It furnishes a tonic that stimulates the appetite, regulates the bowels and prevents scours and is relished by the pigs. It aids in the growth and these gentlemen believe that it is a saving of time, a preveution of disease and is a help in the growth and development of the pig that is profitable for them to use.

These two names are leading successful breeders, feeders and developerswhile the names of those who use it are legion and are scattered all over the country. Not only in feeding pigs and hogs but for horses and cattle it is widely used.

This is in reply to a party who asks if Lucien Arbuckle, whose article some time ago was published, in which he gave as one of the reasons for preventing scours his use of International Stock Food and they want to know if he is still using it.

Our Mr. Cantrall was out to see him this month where he has charge of the herd of W. P. Cowan, near Wheaton, Ill., and he informed us that the buckets of International Stock Food were observed around at convenient points so that the pigs were not deprived of it."

Any comment on this by us would be useless.

International Stock Food Tonic (3 feeds for 1 cent) is sold by dealers everywhere on a spot cash guarantee of your money back if you are not satisfied with its results. 121

Comfort AND Convenience

With a Sanitary Odorless Closet

"Not a Luxury, But a Necessity."

The very thing for YOUR home. People have been looking for years for some method that would discard for all time the barbarous out-of-doors closet. The improved SANITARY Odorless meets the demand in every way. It is cheap, compared to value received, easy to install, lasts a life time and prevents sickness. The out-of-doors Closet spells disease and death—the SANITAY Odorless stands for vigorous health, comfort and convenience. Give this Closet a trial in YOUR home. The women folks will appreciate it more than you will ever know.

Be sure to get our free literature now.

EARL CONSTRUCTION CO.

ATHENS, ONTARIO

"ORANGE LILY SAVED MY LIFE"

These words or expressions having the same meaning are contained in hundreds of the letters I have received during the past year. Many were from women who had suffered agonies from falling of womb; others from women who had escaped dangerous surgical operations, as the tumors and ulcers had been removed by the action of Orange Lily; and others who had suffered from suppressed menstruation, leucorrhoea, painful periods, etc. For all these and the other troubles known in general as Women's Disorders, Orange Lily furnishes a positive scientific, never-failing cure. It is applied direct to the suffering organs, and its operation is certain and beneficial. As a trial actually proves its merit, I hereby offer to send, absolutely free, a box worth 25c., sufficient for ten days' treatment, to every suffering woman who will write for it. Enclose 2 stamps. MRS. FRANCES E. CURRAH, Windsor, Ont.

Chamberlain's Cough Remedy has won its great reputation and extensive sale by its remarkable cures of coughs, colds and croup. It can be depended upon. Try it. Sold by all dealers.

period of foaling approaches. Shaft work is generally associated with the possibilities of accident or over-exertion, and should be discarded. If a mare is a noted sweater, then over exertion should be avoided seeing that its continuance may interfere with milk secretion. The bowel discharges require to be watched, and constipation corrected by bran mashes and green foods. The main diet has to be arranged in order to meet the demands of mother and foal. Good chaff and a little grain, and other foods rich in those elements which form flesh and bone, may be required to supplement grazing. Clover is always a useful adjunct to any ration, not only because it affords protein for flesh formation, but also because it stimulates the flow of milk. Towards the latter portion of the period of pregnancy the muscles of the hind-quarters fall away from the buttock, and a shrinkage of the hindquarters and flanks becomes evident. Care should be taken to avoid any class of work entailing excessive fatigue or sudden movements, also jerky exertion. It may safely be laid down as a rule to work draught mares to within a fortnight of their expected time of foaling.

SYMPTOMS.

The ordinary symptoms of approaching parturition are familiar to most breeders. The abdomen becomes more pendulous, the udder enlarged, the teats thickened and extended, and the muscles of the croup less prominent, while the lips of the vagina enlarge and appear slightly parted. Often there is a viscid discharge. The waxy substance found on the opening to each teat drops off about twenty-four hours before foaling, and milk may flow from each teat on the application of pressure. At times the teats do not fill until after foaling. Sometimes the wax on the teats is absent; and yet again in other cases the usual symptoms of milk formation in the udder are delayed until after foaling. When the time approaches for foaling the mare becomes excited and uneasy. Lying down, elevating the tail, and straining, are all marked symptoms of pains. These become more frequent until the climax is reached. Natural parturition is rapidly and easily accomplished. A mare may be seen grazing comfortably, and on revisiting her half an hour later she may again be found complacently grazing, but this time with her foal at foot. It is well to give the mare at least one bran mash daily for two or three days, the aim being to avoid giving her any class of food likely to cause constipation. The after-birth, which, as a rule, is naturally ejected in from three to eight hours after giving birth to the foal, should be buried or burnt.

Fish Oil For Flies.

Fish oil may usually be bought by the barrel at about 45 xrents per gallon, or in 10-gallon lots at 60 cents per gallon. It is a good repellent for flies and similar insects, and may be used in the following mixtures:— (1) Fish oil, 3 parts; herosene, 1 part. (2) Fish oil, 100 parts; oil of tar, 50 parts; crude carbolic acidl 1 part. (3) Fish oil, 1⅓ pints; kerosene, 1½ pints; resin, 1½ lb.; laundry soap, 2 cakes. Mix thoroughly, and add enough water to make 3 gallons. (4) Fish oil, linseed oil or kerosene, 1 pint; coal tar dip, 1 pint, laundry soap, ¼ bar; hot water, 15 pints. Mix thoroughly so as to form an emulsion or 15 cents, or they may be sprayed Any of these mixtures may be ap- on with a small hand sprayer such plied thinly to the animals with such as can be purchased for 40 or 50 a brush as can be purchased for 10 cents.

STEEL frame on steel wheels—that is the lasting basis on which International manure spreaders are built. All parts, including box, beater, spreading mechanism, apron, are built by experts, using best materials, from careful designs based on field tests.

Every detail is strong and durable, built for long life and ease of draft. Among the features that will interest you are these: Simple protected beater driving mechanism, all of steel; load carried on rear axle, insuring traction; reversible gear and worm; low, easily loaded box, with ample clearance underneath; end gate, preventing clogging of beater while driving to the field; etc.

All styles are in the I H C spreader line, high and low, endless and reverse apron, and various sizes for small and large farms. Our catalogues will tell you more. Write for them and let us tell you also where you may see I H C manure spreaders.

BISSELL LAND ROLLERS

are all steel except the Pole. They are braced and stayed to stand all kinds of hard work and wear well. The entire frame, bottom and all, is built of steel. The (18) anti-friction Roller Bearings make light draught.

The Draw Bracket and low hitch do away with neck weight.

The Axle revolves with the drums and there is no squeaking or grinding.

The Cages holding the anti-friction rollers are the best yet; they're MADE OF MALLEABLE ALL IN ONE PIECE—no twisting or binding of the bearings on the axle of the "Bissell" Roller. The Seat Spring is reinforced and is DOUBLED AT THE HEEL. These good features are not all of the advantages of the "Bissell" Roller. Many more good points are built into them, making a Land Roller that is "built for business," that stands up against lots of hard work. Ask Dept M for free catalogue. 75

Halifax Market Prices.

The market prices in Halifax have had a tendency towards lower prices since our last quotations. The most noticeable feature has been the reduction in eggs from 30c. to 25c. per dozen. Eggs are very plentiful now, owing to heavy receipts during the period of mild weather which we have had. Butter has also weakened in price and is now quoted at 30c. for creamery prints, and 26c. for dairy prints. Cheese is just the opposite, and the price has advanced to 16½c. for twins, and 16c. for wholes.

Potatoes are also firmer and are quoted at $1.10 per bag. Other vegetables remain steady.

The price of apples is steadily soaring. In our last writing we predicted $6.00 a barrel before the end of March, and today offerings of No. 1 Spys are bringing $6.00 the barrel and No. 1 Golden Russets $5.50, and Nonpareils, $5.00.

GRAIN.—Oats, bagged, 52c. to 54c. bulk, 29c. to 51c.; Peas, whole, $2.00.

FEEDSTUFFS.—Bran, ton, $27.00 to $28.00; Shorts, ton, $28.00 to $29.00; Middlings, ton, $29.00 to $30.00; Linseed Meal, ton, $40.00 to $42.00 Cottonseed Meal, ton, $36.00 to $38.00; Gluten Meal, $32.00 to $34.00 Corn Meal, $1.65 to $1.70.

GRASS SEEDS.—Timothy, 100 lbs. 8c .to 12c. lb.; less quantities, 10c. to 14c. lb.; Com. Red Clover, 100 lb. lots, 20c. to 25c. lb.; Mam. Red. Clover, 100 lb. lots, 20c. to 25c. lb., less quantities, 25c. to 26c. lb.; Alsike, 100 lb. lots, 20c. to 25c. lb., less quantities, 24c. to 26c.

LIVE STOCK.—Milch Cows, $45.00.

DAIRY PRODUCTS.—Creamery Butter, 30c. lb.; Dairy Butter, 26c. Cheese, 16½ c. lb.

POULTRY AND POULTRY PRODUCTS.—Eggs, 25c. doz.; Fowl, fresh killed, 15c. to 18c. lb.; Ducks, 18c. to 20c. lb.; Geese, Nova Scotia, 17c. to 20c. lb.; Turkeys, Nova Scotia, 22c. to 24c. lb.

FRUIT.—Apples, No. 1 Baldwin, $5.00, No. 2 Baldwin, $4.00, No. 3 Baldwin, $3.00; No. 1 Spy, $6.00, No. 2 Spy ,$5.00, No. 3 Spy, $4.00; No. 1 Golden Russet, $5.50; No. 1 Nonpareil $5.00, No. 2 Nonpareil, $4.00, No. 3 Nonpareil, $3.00.

MISCELLANEOUS.—Hay, $16.00 to $17.00 ton; Wool, 23c. to 25c. lb.; Beef Hides, 12c. to 13c. lb.;Calf Skins 17c. to 18c. lb.; Sheep Skins, 75c. to $1.50.

VEGETABLES.—Carrots, $3.00 bbl.; Potatoes, $1.10 bag; Turnips, $1.25 bag; Parsnips, $2.00 bbl.; Cabbage, 2½c. lb.;Cucumbers, 13c.

Lice on Horse.

It will be best to have the horse clipped, which I know is unusual to do to a cart horse, but by doing so you will find that it will be easier to dress the animal for the lice, and also you will remove with the hair thousands of nits, or eggs, which are attached to the air and are very difficult to destroy by means of dressings. The safest dressing will be made by boiling 1 lb. of bruised stavesacre seeds in 3 gallons of water for two hours, and well brushing in coat with a dandy-brush; this should be done every week, as, though the living insects are destroyed, the nits keep hatching out, and should be destroyed before they become capable of laying more eggs The mane and tail should be washed with carbolic soft soap the day before applying the

INVINCIBLE Fencing and Gates
"The wisest investment I ever made"

Yes! We have thousands of satisfied customers all over the Dominion who are buying and recommending this high grade fencing.

Everyone who has given it a thorough trial will frankly admit that fence troubles and expenses vanish the instant you erect

INVINCIBLE FENCING

Manufactured exclusively from Open Hearth Steel—the hardest, stiffest and most weather proof fence steel on the market. And it is the ***only*** wire fencing made entirely in Canada.

The Government recommends it and ***we guarantee it.***

Every strand is heavily galvanized with pure virgin zinc. Absolutely impervious to weather conditions. Can't rust or corrode.

Each intersection is securely bound with our strong lock. Can't break or sag. And because it does hold so firmly and permanently, posts can be spaced further apart.

Invincible Fencing is a remarkable economy. It is lower in first cost than any other high quality wire fencing on the market. And it's first cost is the ***only*** cost.

Lasts a lifetime. No repairing. No expense of any kind. Whereas ordinary wire fencing, being poorly galvanized, corrodes in a few years and has to be repaired or entirely replaced.

Invincible fencing has all the ***strong qualities*** of every high class fencing on the market—but none of the weaknesses. It is the ***only*** fencing for permanence and economy.

OUR SALES METHOD THE BEST. Do not spend your money until you see what you are buying. The prices of "Invincible" Fencing are low enough to meet any competition, and by our method you get an opportunity to test and stretch the fence before you pay for it.

Let us tell you about imported Bessemer fence wire, with skimped galvanizing. Learn more about "Invincible" Fencing. Our new catalogue is ready and will be sent on request.

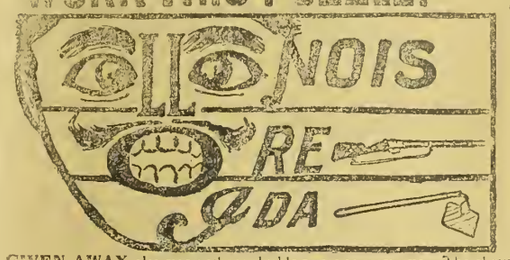
WORK THIS PUZZLE! WIN A PRIZE!!

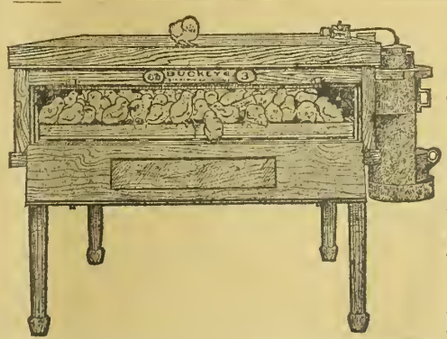


$50. CASH PRIZE

GIVEN AWAY also many other valuable prizes as premiums. The above three sketches represent THREE STATES IN THE UNITED STATES. Can you tell what they are? Surely you can solve this PUZZLE, SO DO SO. If you can make out the names of the Three States we will send you a BEAUTIFUL PICTURE POST-CARD FREE—also a certificate of entry in our PRIZE CONTEST closing December 31st, 1914. Somebody who sends for the particulars of this PRIZE CONTEST telling us WHAT THREE STATES ARE REPRESENTED by the above Three Sketches, will receive a $50 GOLD WATCH or $50 IN GOLD MONEY PRIZE offered as a premium for highest efficiency in the introduction of our goods during the ensuing calendar year as stated in the entry certificate. In the event of a tie between two or more persons for the prize, a prize identical in character and value with that tied for will be given to each person tied. We will also send you a chain and watch offer besides any PRIZE YOU WIN. Try at once, it may be you. Send your answer on a Postcard or a letter, write your name and address plainly.

DOMINION WATCH CO., Dept. 234 MONTREAL, CANADA

During the P. E. I. Short Course in Agriculture breeding herds of Ayrshire cattle were supplied by Simpson Bros., who had been breeding Ayrshires according to their utility value for a number of years, and who strongly exemplified this policy in the animals they had on exhibition. Andrew McRae & Sons also had a number of valuable Ayrshires on hand, among them being the notable Milkmaid 7th, that completed an official record of 16,679 pounds milk and 729 pounds fat a few months ago. Their herd includes many other valuable females of high producing quality, among them is Spicy Lucy that produced 12,640 lbs. milk in twelve months, or 505 lbs. estimated fat; Dairymaid produced 11,100 lbs. milk and 576 lbs. estimated fat; Bellevedore Princess produced 7,785 lbs. milk in ten months and 290 lbs. estimated fat; Fairview Queen, a daughter of Milkmaid 7th, two years of age, produced 6,500 lbs. milk and 285 lbs. estimated fat in six months Gurta has produced 5,440 lbs. milk and 206 lbs. estimated fat in four months; Annie Laurie 3rd has produced 5,060 lbs. milk and 200 lbs. estimated fat in five months; Milkmaid 4th has produced 7,450 lbs. milk and 327 lbs. estimated fat in eight months. This last record is exceptional when we consider that Milkmaid 4th is in her fourteenth year. Many of these cows are still in their lactation periods and several have already produced official records. Before the close of the year we expect to have the full records to offer as an indication of the producing qualities of this herd.



Now is the time to place an order for an Incubator or Brooder.

There is none better than the BUCKEYE. We have them from 60 to 350 eggs size and from $12 00 to $45.00 each.

Can be run with either gas or oil. Let us sell you one and remember ANYONE CAN HATCH CHICKENS WITH A BUCKEYE MACHINE.

PIMPLES Are an "EYE SORE."

Pimples are caused by the blood being out of order. Those little festering sores appear on the forehead, on the nose, on the chin and other parts of the body, and although they are not a dangerous trouble they are very unsightly to both you and your friends.

There is only one way to get rid of them, and that is to purify the blood.

Burdock Blood Bitters is without a doubt the best remedy on the market for this purpose.

Wm. F. Donohue, Jr., Hamilton, Ont., writes:—"About six months ago my little son's face was literally covered with pimples. I tried every preparation I was told of by my friends, but to no avail. Soon I thought I could not have them fixed up, and would have to wait, and let him grow out of them, but thanks to Burdock Blood Bitters they are all gone, and I gladly recommend it to anyone."

Burdock Blood Bitters is manufactured solely by The T. Milburn Co., Limited, Toronto, Ont.

Children are much more likely to contract the contagious diseases when they have colds. Whooping cough, diptheria, scarlet fever and consumption are diseases that are often contracted when the child has a cold. That is why all medical authorities say beware of colds. For the quick cure of colds you will find nothing better than Chamberlain's Cough Remedy. It can always be depended upon and is pleasant and safe to take. For sale by all dealers.

It costs only a one cent Postal card to answer any advertisement in Maritime Farmer and you will get many dollars worth of information.

Does Winter Kill Potato Blight in Soil?

Following is a brief review of Bulletin No. 367 of the Geneva, N. Y., Experiment Station on the Persistence of the Potato Late-Blight Fungus, in the Soil by F. C. Stewart.

Rotation of crops is necessary to prevent transmission of several plant diseases. Cabbage should not be planted the second year where the first season's crop has shown much clubroot, and potatoes should not follow potatoes where scab has prevailed, nor where Fusarium wilt and its accompanying tuber rot have been destructive.

The most destructive potato disease in New York State, however, is late blight, with the common rot that follows it; and questions relating to transmission and control of these troubles are exceedingly important. Does this fungus survive the winter in the soil and make a blighted field of one year unsafe to use the next?

Most authorities hold that the fungus causing these two troubles, Phytophthora infestans, does not overwinter in the soil; and that there is no more liability to blighting and rotting on a field thus affected the year before than on one free from the disease. Recently two authorities, one in England and one in America, have advanced the opposite views and advise against planting potatoes on soil where blight has been prevalent.

To test the liability to such transmission, the Station Botanist has carried on careful tests in two seasons; and finds no evidence that the fungus can survive the winter in the field, in central New York, at least. In each of the tests, soil from a field of diseased potato plants was thoroughly mixed, in boxes, with broken, rotten tubers and pieces of blighted stems; and the boxes were exposed to the weather during early winter. Later the boxes were brought into the forcing house, a sound potato tuber was planted in each and conditions made as favorable as possible for growth of plants and development of the disease. In spite of warmth, abundant moisture, both in the soil and in the air, and luxuriant, succulent growth of the plants, not a sign of blighting appeared, even when the plants were grown in a special glass chamber and thoroughly wet daily with water drained from some of the soil mixed with diseased material, or were painted with a thin mud made from such soil.

The results, being negative, do not prove that the late-blight fungus cannot remain alive over winter in the soil, but they make such persistence appear highly improbable.

It would seem unnecessary, then, to change the location of the potato crop to avoid this disease; especially as we know that thorough spraying will control both blight and rot and will increase the crop enough, taking one year with another, to make this a highly profitable regular practice in potato growing.

The spraying of the late potatoes should never be neglected.

Pony's Wounded Hock.

Wounds in the hock are always a great bother to heal, as there is no muscle underneath, and the constant movement of the limb breaks down the new growth of the skin, making a nasty raw crack, which is called a sallender. The thickening at the edges of the wound will always remain, but ought to cause no trouble. Keep a cradle on the pony to prevent it getting at the wound, as there is often a good deal of itching when the parts are nearly healed, and do not allow the pony to lie down for a while, but put on the pillar reins at night. Dress once a week with mercurial ointment and try dusting the part with one part of powdered burnt alum and one part of fuller's earth, or a lotion of sulphate of copper, three drachms; sulphate of zinc, three drachms, and sugar of lead, three drachms; water to one pint. This should be well shaken up before using, as a good deal of precipitation takes place. Do not, if you can manage to do without a pony, work till the place is properly healed, as each time it breaks out it is more intractable and difficult to heal. Give once daily sprinkled over its food three drachms of Fowler's Solution, being careful to keep the bottle in a cupboard away from children, as it is poisonous if taken in any quantity.

Handy Help for Farm Homes

Old Dutch Cleanser lessens work in scores of ways.

TAKES THE DRUDGERY FROM SCRUBBING AND CLEANING

In the dairy, milk cans, pans and pails clean much easier and quicker.

SAVES WORK AND TIME in cleaning harness, feed boxes, carriage tops, etc.

SEED OATS

Some Brokers selling Western Oats are sending out circulars intended to fool the farmers and claiming their seed oats as good as ours. Last year we had *no* successful competitors and nearly every one of our patrons are ordering again this year.

We just shipped out 6,000 Bushels to a Quebec city firm. The Dominion Government Inspector who examined those oats writes us that they are *even better than last years supply.*

In 1913 we shipped an agricultural Society in Rimouiski 12,000 Bushels which yielded by the Sec'y's Report *"The Best Crop we have ever seen."*

If your Dealers have not secured Read's Island Graded Seed order early from ourselves. Ordinary, true to name, Banner Club or Registered *Seed.* The extra yield twice over pays for this article.

FLORICULTURE.

From this time throughout the winter, greater care and attention must be given to watering house plants than was necessary in summer. In the dry and heated rooms plants dry out more rapidly and especially root-bound plants, which should occasionally be given a thorough soaking by plunging the pot in water for a few minutes, to make sure that all the ball is kept moist. On the other hand, freshly potted plants or those that are not strongly root-bound, should not be over-watered as the soil easily becomes sour in winter, causing decay of roots and crown. Have no set time to water your plants, but look them over often and only water them when they need it, which is whenever the top soil commences to show slightly dry. Remember to keep the drainage holes in the pots open and free, so that all surplus water can readily pass off and always empty out surplus water from saucers, after watering. Also, do not forget to give all the pure air you can by any means possible even in cold weather. This can be done by opening outerdoors a few moments at a time. Plants in houses suffer severely for want of pure air. A few degrees of moisture in the air is also essential for best results. Spraying or washing all smooth-leaved plants is necessary in sunny weather. Strict attention to the above points will give you healthy, strong plants.

H. A., Moncton, writes: What is the matter with my Hyacinth bulbs that I am trying to grow in glasses. I keep them in the kitchen where it is hot most of the time, and how can I change the water? I tried the Chinese Lily in the same way for Christmas, and they did not do well at all. Only a lot of weak foliage.

Do not grow them in a hot, warm place. Place the dish in the sunlight and give it plenty of air. Do not keep it in a hot place, as it is sure to cause a very tall rapid growth; buds forming, only to dry up when half developed. This would have been avoided by keeping the bulbs in a bettee ventilated room as directed above.

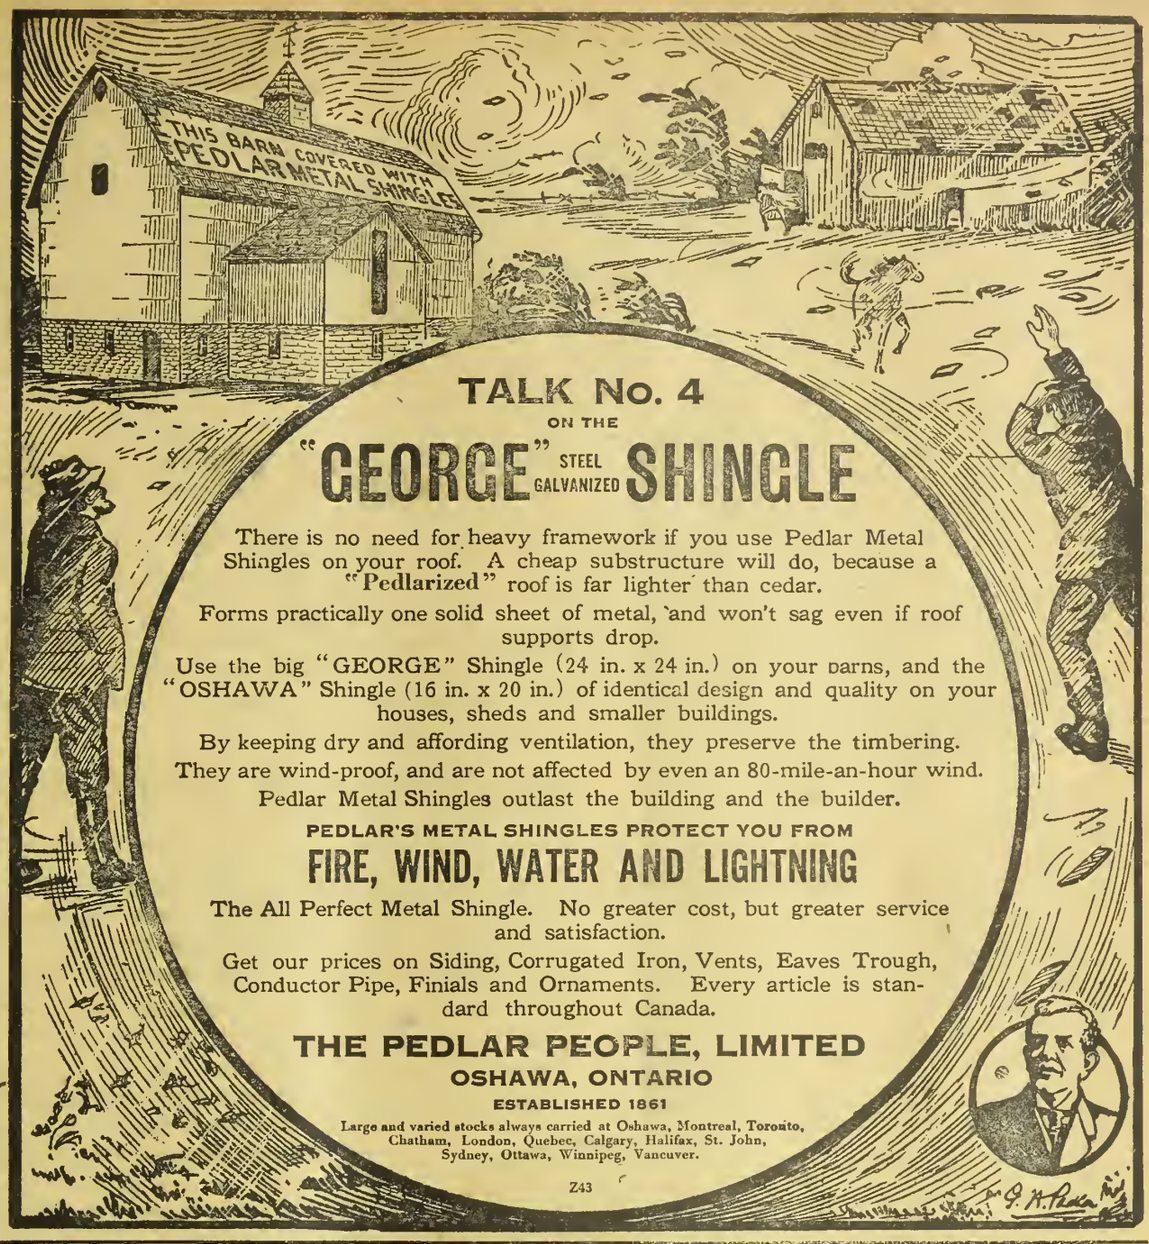
As regards changing the water. This should only be done to prevent it becoming offensive. The dish should be set flat in the sink and fresh water poured slowly into it, thus flushing the old water out of it as it were. Do not attempt to pour the water out, as that disturbs the roots and this should be avoided as much as possible.

Successful Short Courses in Nova Scotia

A most successful series of Short Courses has just been completed in Nova Scotia. The management of these courses was in the hands of the Nova Scotia Department of Agriculture and the instructors were members of the Agricultural College Staff, assisted by S. J. Moore, Dominion Seed Inspector. The funds for the purpose were supplied from the appropriation made by the Dominion Government for the aid of Agriculture in the Province.

The distinctive feature of the Short Courses, which have just been completed in this winter of 1914, has been their establishment of a somewhat permanent basis in important centres in the several counties of the province.

At each of four places in the Province, Yarmouth, in Yarmouth Co.; Bridgewater, in Lunenbury County; Musquodoboit, in Halifax County,



TALK No. 4
ON THE
"GEORGE" STEEL GALVANIZED SHINGLE

There is no need for heavy framework if you use Pedlar Metal Shingles on your roof. A cheap substructure will do, because a "Pedlarized" roof is far lighter than cedar.

Forms practically one solid sheet of metal, and won't sag even if roof supports drop.

Use the big "GEORGE" Shingle (24 in. x 24 in.) on your barns, and the "OSHAWA" Shingle (16 in. x 20 in.) of identical design and quality on your houses, sheds and smaller buildings.

By keeping dry and affording ventilation, they preserve the timbering.

They are wind-proof, and are not affected by even an 80-mile-an-hour wind.

Pedlar Metal Shingles outlast the building and the builder.

PEDLAR'S METAL SHINGLES PROTECT YOU FROM
FIRE, WIND, WATER AND LIGHTNING

The All Perfect Metal Shingle. No greater cost, but greater service and satisfaction.

Get our prices on Siding, Corrugated Iron, Vents, Eaves Trough, Conductor Pipe, Finials and Ornaments. Every article is standard throughout Canada.

THE PEDLAR PEOPLE, LIMITED
OSHAWA, ONTARIO
ESTABLISHED 1861

Large and varied stocks always carried at Oshawa, Montreal, Toronto, Chatham, London, Quebec, Calgary, Halifax, St. John, Sydney, Ottawa, Winnipeg, Vancuver.

Order Your Horse Posters From the Maritime Farmer

and Shubenacadie, in Hants County, a grant was given to the agricultural society conducting the annual exhibition, to assist in erecting a building suitable for the permanent housing of Short Courses, similar to those given at the college at Truro. In every case the society supplemented this grant sufficiently to supply a commodious building suitable for exhibition of live stock and for the giving of demonstrations along the various lines of agriculture. The number of centres selected was limited by the fact that instruction was largely given by the regular staff of the Nova Scotia Agricultural College, whose services could only be spared for a limited time. This arrangement provided for the very best instruction, which could be given in the Province of Nova Scotia.

The length of the course in each place was three days, the classes for the most part being conducted from 9.30 to 12, from 1.30 to 5, and from 7.30 to 9.30. Instruction was given in Live Stock Judging, Care and Management, in the Judging of Sced, and in the cultivation of the soil, in Horticulture, Veterinary Science and Poultry. Never before had such practical instruction been given at the centres where the courses were held, and that this was appreciated was evidenced by the fact of the steady growth in attendance from session to session. It was very noticeable at every course that any person who attended one session, no matter from what motive, became interested and attended the remaining sessions of the course. This resulted invariably in a steady growth in attendance and interest from the first day to the last of the course. The Yarmouth Course, for example, opened with 122 students, which number increased until it reached 170. The Bridgewater Course opened with an attendance of 67 students, which grew to 85 despite the thermometer ranging from 15 to 20 degrees below zero. Musquodoboit opened with 60 and closed with 160, notwithstanding that a heavy storm on the day preceding the opening session blocked the roads and made it extremely difficult for people to get there at all. In Shubenacadie the course opened with 37 and closed with 92, despite the fact that the course was held at a period when the first good sleighing of the season gave the farmers a chance to haul in their lumber and wood supply.

The above mentioned figures indicate the actual attendance at one session. The total number of names enrolled was somewhat over 200 at Yarmouth, 120 at Bridgewater, 175 at Musquodoboit and something over 100 at Shubenacadie.

At the conclusion of all these courses, those in attendance passed a hearty vote of thanks and stated that the courses had been of such a character as to prove very helpful to every one engaged in farming and it was their opinion that if the course was repeated, provided the weather conditions were favorable, the number in attendance would be very much larger.

As to number the members of the Agricultural College Staff were extremely well pleased for not only was the attendance from every standpoint very satisfactory but the significant feature was the earnestness with which the students applied themselves to the various studies. No attempt was made to arrange a single popular occasion; it was nothing but class work from beginning to end, but instead of the people becoming satisfied with this class work, the invariable request was for extra classes, which, however, could not, under the circumstances, be arranged for.

At Musquodoboit the Inspector of Schools for Halifax County, Mr. Creighton, made use of the opportunity to call together a convention of the school teachers in the Musquodoboit Valley. These school teachers, in addition to considering matters pertaining directly to school teaching, attenhed nearly half of the classes of the Short Course and so had an opportunity of appreciating the value of agricultural instruction, when properly given, in their own school, and at the conclusion, these teachers expressed themselves as ready to co-operate with the Department of Agriculture in developing an interest in the study of agriculture in the schools for which they were responsible. Mr. DeWolfe, Director of Rural Education, was present and made arrangement for the distribution of high class cereal and other field crops seed and also for the distribution of eggs from poultry of special merit to scho.ars in the school. Tentative plans were also drawn up for a school exhibition, which in addition to the usual prizes, would offer special prizes for those scholars who had made the best use of their seed and had gotten the best

The Biggest Thing on the Farm

A CAN of good paint is the biggest thing on the farm—the best investment you can make.

Prosperity begets prosperity, and well-painted buildings lend an air of prosperity to the whole farm. The modern farmer—the man who is most successful—is the man who realizes the true value of keeping his farm buildings looking "Spic and Span".

Martin-Senour "100% Pure" Paint

"The Paint for Wear and Weather"

is the cheapest paint you can use — not the lowest in price per gallon, but the cheapest by the job, because it thoroughly covers more surface and wears longer than any other Prepared Paint, or hand-mixed-lead-and-oil.

Every drop of Martin-Senour Paint is "100% Pure"—Pure White Lead, Pure Oxide of Zinc, Pure Linseed Oil, Pure Turpentine Dryer, and Pure Colors — the combination of which, when ground and mixed by scientific methods, through powerful machinery, produces a paint that is most economical and most satisfactory to use.

Write for our Booklet "Town and Country Homes" — it gives you many helpful suggestions on good painting, and is free for the asking. 33

results from the eggs supplied.

In addition to these four Short Courses, an Apple Packing School was held at Kentville during the last week of February. The head instructor was P. J. Carey, of the Fruit Division of the Dominion Department of Agriculture, and the other instructors were W. S. Blair, Superintendeot of the Experimental Farm, Kentville; J. M. Robinson, B. S.A., Assistant, at the Experimental Farm, Kentville, and Prof. W. H. Brittain, B. S. A., Entomologist for the Province of Nova Scotia.

This Apple Packing School was a most successful one although the attendance, which in one day reached the 100 mark, was almost too large for the most satisfactory kind of work. It is proposed next year to carry on a series of these Apple Packing Schools throughout the whole Province, and, if the success which attended the inaugural one at Kentville, is a criterion, there is no doubt that the ones to be held next year will not only be successful, but will prove very beneficial to the fruit growers of Nova Scotia.

Just how much was accomplished by these courses must be left for the future to determine but it is certain that every farmer who attended went away with a better idea of, and more sympathy for, the work attempted at our Agricultural College, and by our governments, Federal and Provincial, than he had before and there is no doubt that the movement will tend to make the farmers in Nova Scotia appreciate the value of agricultiral education as they never did before. It is significant that already unanimous requests has been made to the members of the Agricultural College staff for longer courses at those places where the courses were held during the present winter and for the establishment of other courses in other centres of the Province.

The movement is fraught with great possibilities and is bound to lead to development along agricultural lines which is sure to follow the teaching of the underlying principles of practical agriculture.

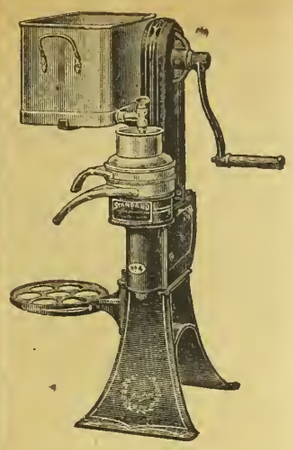
Food for Sows Not Coming in Season.

It is often quite impossible to tell the reason why the ordinary course of nature should not be followed. You do not say what you are feeding them on, only they are in good condition and most likely this is the cause. Feed on sharps, swill, and plenty of green food, giving them no barley meal. Turn out into pasture as often they seem to find plants or herbs which flushes them like rape does in the case of the sheep. A good uterine stimulant is a mixture of quinine, iron and nux vomica. Have the following prescription made up at the chemist's, and give one every morning mixed up with the food:—Sulphate of quinine, four grains; carbonate of iron, thirty grains; powdered nux vomica bean, four grains; powdered liquorice root, half an ounce. If unable to turn out in field give plenty of rape, kale, kohl-rabi or cabbage.

The Hair.

The hair is provided with oil by the sebaceous glands that lie at its roots. Regular and vigorous brushing of the hair increases the flow of oil and keeps the hair glossy. The hair is fed by blood vessels that enter the inner layer of skin, in which the hair root is imbedded. A good nervous system, which promotes good circulation, is one af the etsentials in producing a healthy growth of hair.

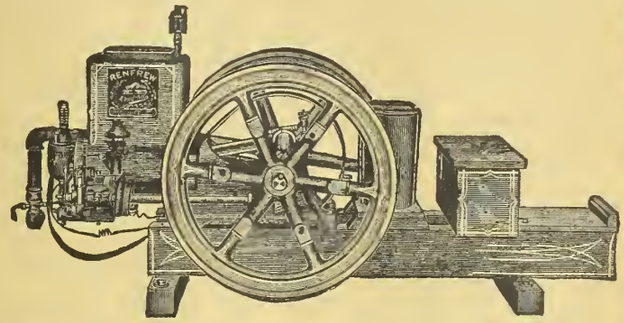
It is as necessary for the scalp to be kept clean as for the surface of any other portion of the skin to be kept clean. The hair should be thoroughly brushed to remove dust. It should be left loose and free at night to allow the moisture to evaporate and to permit air to pass through it freely. The scalp should be thoroughly rubbed at least once a week. This promotes a good circulation and thus gives the hair a vigorous growth. The hair should be washed at least once a month. Soft water, mild soap and thorough rinsing in clean water are essential to a successful washing.



The Big Trio of PROFIT-MAKERS

You must have the close-skimming **Standard Cream Separator** if you are to get largest cream profits from your cows. The Standard skims, on the average, down to .01 per cent. The cream is of highest class because skimmed in an absolutely sanitary bowl. All gears and bearings run in a bath of oil. Machine requires oiling but once every three months. Low supply can. High crank shaft for easy turning. Made of very best materials in large modern factory. Very latest in design. Write for Separator Booklet containing complete description and particulars of Government School tests.

More and more is the **Renfrew Standard Gasoline Engine** taking the place of the hired man. Some farmers tell as that they could scarcely get along now without their Renfrew Standard. This is the engine that aroused so much admiration and enthusiasm at Toronto Exhibition and other Fairs. It starts without cranking in all kinds of weather. Has governor of fly ball steam engine type. So perfectly balanced, it doesn't need to be anchored down. And many other improvements told about in our engine booklet. Write for a copy. All styles and sizes from 2½ to 60 h. p.



A greater necessity than almost anything else on the farn is a good scale. How can a farmer make sure of getting all that his cattle, hogs, sheep are worth unless he weighs them? The **Renfrew Handy Two-Wheel Truck Scale** has paid for itself on many farms in less than three months. A truck and a scale combined. Designed especially for farm use. Strong, compact, durable, yet light-weight. Tested by government for accuracy. Write for scale booklet. It will open your eyes.

Guernseys in Prosperous Pictou County

On Spruce Grove Farm, Scotsburn N.S.

The Steading of Messrs McKay & Son

D. G. McKay and Family

Reading from left to right:
D. G. McKay, Mrs. McKay, Kenneth G., Allie, Norman G., Miss McKay, the little child in the foreground is a grand daughter.

The editor of the Maritime Farmer had occasion to visit the historic town of Pictou, N. S., a few weeks ago and while there was pleased to renew acquaintances with several of his classmates in good old Pictou Academy, eighteen or twenty years ago.

Pictou Academy is not the only famous institution in the county of Pictou. The county is a veritable hive of industry with its wealth of agricultural, mineral, fisheries and forest resources.

The coal mining areas of Pictou county, so systematically developed and the adjoining manufacturing centres so rapidly increasing their plants and the consequent increase in the employment of skilled labor has created a demand for the products of farm, forest and seas and thus established for these products, within the county a home market that is difficult to equal or excel.

Pictou county therefore, possesses several characteristics that make it a most desirable county in which to live—vast agricultural resources, good home markets and last but by no means least a rural population noted for their industry, integrity and intell gence. Pictou county farmers are a prosperous people and the practice of the three traits of character already referred to has made them so.

A Few of the Spruce Grove Guernseys

The industry, intelligence and integrity that characterized that noble band the Ship Hector brought to the Pictou shores many years ago have stood them in good stead all down the years. Education was not neglected. It stood second only to their religion and as a consequence men of ability and force of character constitute the greatest asset that Pictou county has given to the world. Go where you will; look over the glossary of names of those in positions of trust who are fast carving their way to fame and fortune—a credit to the land of their birth—and there you will find enscrolled the names of many men and women too, who first saw the light of day in Pictou county and received their early training in Pictou Academy.

We are justly proud of these men, but what is the gain of some other places in the respect of having such men as citizens in Pictou's loss. What might Pictou county not become if these men were still within her borders using their brain and brawn in the development of her resources?

While we are justly proud of these men and glory in their achievements we must admit that a few of her sons who are actively engaged in the development of the county's resources are worth more to the county than the whole galaxy above referred to. We take off our hats and heartily grasp the hand of the man who has remained on the farm and who by the application of the three great traits of character referred to is "doing things."

On the occasion of our visit to the academy town, we pondered over this matter while enjoying the comforts so lavishly dispensed by mine host Wallace of the Wallace hotel. The names of persons and places we knew in the county flashed through our minds. Scotsburn with its creamery was one of the first to present itself and then came a thought of the men who have helped to make the Scotsburn creamery what it is today. (The reader will find a short article on the recent annual meeting of this progressive creamery on another page of this issue). Among others the names of D. G. McKay & Son was one of the first to engage our attention, perhaps because we were personally acquainted with the Messrs McKay having met both father and son on many occasions at various agr cultural conventions and not infrequently at the fall and winter fairs with their splendid herd of Guernsey cattle. (The reader will find the report of the last annual meeting of the Canadian Guernsey Cattle Club on other pages of this issue). Mr. D. G. McKay has been president of the Canadaian Guernsey Cattle Club since 1907. The Club was organized in 1905.

Having a few hours to spare we decided to avail ourselves of the opportunity to fulfil our promise to Messrs McKay to sometime pay them a visit and see their Guernseys in their home quarters. A pleasant drive of seven miles brought us to Spruce Grove Farm, their comfortable steading just as the shades of a pleasant winter's night were falling.

Spruce Grove Farm is situated at Heathbell, about two miles feom Scotsburn Station, where is located the Scotsburn creamery, the largest creamery in the Province of Nova Scotia.

The farm consists of 112 acres, 80 of which are cleared, the remainder being a wood lot. It is well watered by a neverfailing brook that traverses the pasture fields. The soil is a clay loam and the topography of the surface is such as to give very good natural drainage. The rotation hay, roots, grain hay is followed on as much of the farm as possible. About 500 bushels of grain, mostly a mixture of oats and barley, upwards of 2000 bushels of turnips and all the hay required to feed their large herd of Guernseys and four or five horses are grown on the farm. The policy of the Spruce Grove Farm is to feed everything grown on the farm and dispose of it in the finished product.

What Messrs. McKay have been able to accomplish with Guernseys is within the reach of each and every farmer in the Maritime Provinces if they apply the same amount of intelfigence to their work as have the proprietors of Spruce Grove Farm. Messrs McKay purchased their first purebred Guernsey no longer than ten years ago from Glen View Farm, Sussex, N. B. At the time of our visit every animal in the herd with the exception of three were purebreds.

Lord Trim II. (Imp.) As a Yearling

Now Head of the Spruce Grove Guernsey Herd
A bull with a producing ancestry.

In this connection we would like to call the attention of our readers to the policy outlined for the Nova Scotia Agricultural Societies by Supt. F. L. Fuller. Each society binds itself to purchase and keep only one breed of cattle for a period of ten years and as a consequence, like the experience of Messrs. D. G. McKay & Son the farmers of Nova Scotia are beginning to realize that it does not pay to change from one breed to another, as used to be the case before Mr. Fuller inaugurated the present policy. By sticking to one breed Messrs. McKay have in ten years acqu red a herd of which any farmer might feel justly proud. Their example is one that you may safely follow and feel confident that in the course of ten years you too may be the proud possessor of as good a herd of your chosen breed.

Continued on page 455.

Beauty of Spruce Grove

One of the Heiress' Calves, owned by D. G. McKay & Son.

The Fifth Annual Maritime Horse Show

The fifth annual Maritime Horse Show held in the Fair Building, Amherst, N. S., on the 1st, 2nd and 3rd inst, marked another milestone in the annals of Maritime horse breeeding.

That the citizens of the Maritime Provinces are a horse-loving people, was clearly evidenced by the throngs of visitors who came early and stayed late to witness the various events in which the pick and pride of Nova Scotia, New Brunswick and Prince Edward Island equines were exhibited.

Mr. Fred Richardson, Columbus, Ont., and Dr. J. A. Sinclair, Cannington, Ont., placed the awards in the Draft and Light Horse classes, respectively.

Despite the fact that one of the most blustery days that the weather man sent along this winter marked the middle day of the fair, the total attendance was not very many behind that of last year.

A very marked improvement in the quality of horses was noticeable in nearly every section.

THOROUGHBREDS.

The Thoroughbred class was not overburdened with entries. The only representatives of the breed being the aged stallions Bendemeer, owned by George M. Holmes, Amherst, and Melsino by Meltonian, owned by Geo. Carvil, St. John, the two-year-old stallion Busy Amherst, by Previous, the yearling filly, Anna Bendemeer by Bendemeer, and her dam Anna Smith all placed in the order named in their respectve classes.

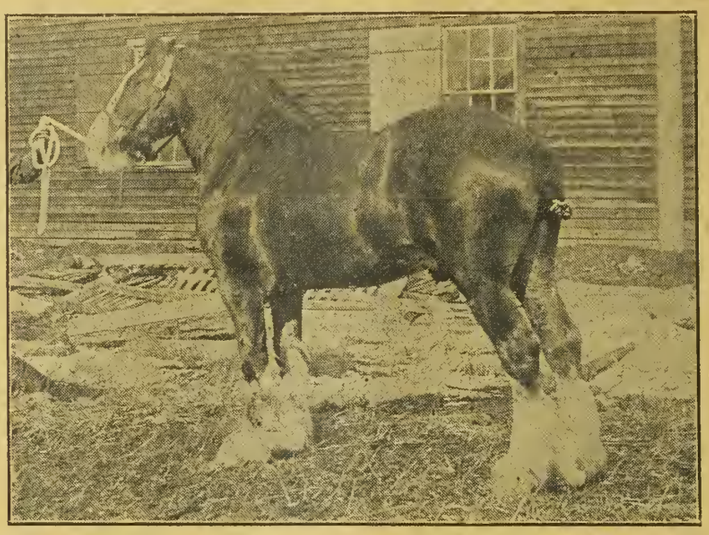
STANDARD BREDS

were out in full force. Seven aged stallions, the same number as last year, but not the same horses in all cases, were brought before the judge. It was found inadvisabnle to give them the usual tryout on the streets so that all the bursts of speed that could be indulged in was given under difficulties in the indoor ring. Major Todd by Todd, the champion of last year's show and a winner at the fall shows, again headed the list. This broadened that smile that won't com off on the countenance of his owner, our friend, Hammond Kelly, Charlottetown, as ge again carried off the coveted diploma. Lord Hastings by Hardwick, owned by H. W. Ryan, of Petitcodiac, came in for second money closely followed in third and fourth place by Frank C. Reddin's Leeland F., by Beaubell, and Dr. M. F. Ronan's, Maid's King by May King. Further down the line and beyond the range of prizes were Ariel Wood by R. M. T.; Major Stratton by Winfield Stratton and Right Wilkes by Abbot Wilks, all out in the pink of condition.

In the three-year-old stallion class there were two entries. Silk Bow by Silk Cord the leader of the two year old class last year, again added a red ribbon to his laurels. Lake-Be-Sure by Will-Be-Sure followed in second.

Two entries appeared in the two-year-old stallion section. Belmono by Moko, owned by Chas. Thompson, of North Sydney, and Kealy B., by Achille. They won the red and blue ribbons respectively.

In the aged mare class there were ten entries. Mamie Jay, by Jay McGregor, driven by her owner, Chas. Thompson, headed the list and carried off the female championship, while in second place was found E. I. Peel's Dolly, followed in third and fourth places by Kitty McNeil by Achille and Annie Mayflower by Tom Medium and owned respectively by Robert P. P. Fraser & Son, New Glasgow and W. W. Purdy, Wentworth Station. Ohutta by Ozone, Owned by J. A. Reid, Fredericton, had no competition in the three-year-old filly class.



Baron Squire

Champion Clydesdale Stallion at 1913 and 1914 Maritime Horse Shows, Amherst, N. S. Owned by McFarlane Bros, Fox Harbor, N. S.

Shoogyshoo, by Commodore Lydiard, was the only filly in the two-year-old section. Geo. Holmes' Wireless had no company in the yearling class.

HACKNEYS

were shown by McFarlane Bros. and R. A. Snowball. Snowball's Model Performer in the aged stallion class, carried off the red and later the purple for the best Hackney stallion. Sedgeford Enterprise followed in second place.

The Hackney mare classes were the weakest that have ever been at Amherst. The only representative being Eva by Fashioner in the three-year-old class and Queenie Baker, by Model Performer in the yearling class The diploma for best mare any age, went to Queenie Baker. R. A. Snowball thus captured the Hackney Association Medals.

CLYDESDALES

were as usual the big feature of the show.

Seven aged stallions, one less than last year, appeared before Judge Richardson. McFarlane Bros.' Baron Squire, the champion of the 1913 show, by Baron Pride; Snowball's Baron Balgreddin by Baron Primrose McMonagle's Fash Favorite by Royal Favorite, O'Brien's Bob McGregor by Norseman, McFarlane's Baron Mac by Vanderbilt, Chapman & Fields' McQueen Yet by McQueen and Donkin's Stanley by Burnbrae were awarded positions in the order oamed. Baron Squire later captured the coveted championship diploma. His closest competitor for the honor being Snowball's imported three-year-old, Baron's Own by Baron's Pride out of Minne Ha Ha.

Jimmie Reid, an Ontario bred horse shown by Frank Archibald, Truro, had no competition in the two-year-old class. Logan Bros.' Homestead Marmion by Handy Andy would have stood some competition in the yearling class.

Out of an entry of eight aged Clydesdale mares five appeared. Logan Bros. Baron's Fancy by Baron Pansy McFarlane Bros.' Bess Spencer by Sir Spencer, Logan Bros.' Pink Rose by Up-to-Time, Snowball's Moss Rose by Baron Balgreddin and McFarlane Bros.' Nell Bowie by Golden Chief, graced the arena and won the most coveted honors in the order named. Baron's Fancy captured the Silver cup donated by Douglas & Co. Amherst, for the best Clydesdale mare any age.

The three year old filly class had six entries. Snowball's Miss May by Baron Balgreddin, Embree's Augusta by Johnstone Victor, Logan Bros.' Susie of Homestead by Handy Andy, H. S. Pipes & Son's Princess Nora, by Norseman were the prize winners in their respective order. H. S. Pipes captured the red ribbon in the two-year-old class with their Fleur-de-lis by Handy Andy and the blue went to R. A. Snowball's Kate of Meadow Brook by Baron Balgreddin.

Logan Bros.' Homestead Pansy by Handy Andy, met no competition in the yearling class.

PERCHERONS

were few in numbers and did not make as good a showing as was made at Halifax last fall. The aged stallions, Lord Roberts, Roderique and Pegel were the only entries in their class and were awarded the red, blue and white ribbons in the order named LorMd Roberts was latcr awarded the male championship.

Chas Symes showed Black Prince by Embargo, a two-year-old, the only other Percheron stallion in the ring.

Symes' Distinguee and R. B. Latta's Mandoline competed for honors in the aged mare class. The red ribbon went to the former and later she was also awarded the purple. R. B. Latta also showed a yearling filly by Lord Roberts.

ROADSTERS

were out in large numbers and some nice useful horses were included in the various sections. The stallion section comprised the aged Standard Bred Stallions referred to in the Standard Bred class and were placed in the respective positions awarded to them in their breed class.

Out of an entry of twenty-one horses in the section for aged Mares or Geldings, 15-2 hands or over, seventeen stepped into the ring. Chas. Thompson's Mamie Jay, champion mare in the Standard Bred class, was placed at the top of the list, followed in second place by J. C. Purdy's Susie Wilkes by Abott Wilkes. An Ontario bred mare, shown by W. A. Humphrey, Moncton, captured the white ribbon and the fourth and fifth prizes were awarded to G. A. Doncaster's Dolly Brazilian by Brazilian and J. J. Shipley's Bonnie by Kalol.

Twenty horses out of an entry of twenty-five in the section for mares or geldings foaled previous to Jan. 1, 1911, under 15-2 hands, kept the judge busy for some time. The survival of the fittest prevailed and very soon five choice ones were brought before the audience to receive their awards. Spurgeon Gammon's R. M. T., by Israel, Lowther's Rosie by Dalhousiel J. C. Purdy's Billy by Will-Be-Sure, and his Nellie Oakes by Fair Oakes and B. L. Black's Molly by Ajalon were awarded prizes in order named.

Eleven three-year-old horses made an excellent showing in their class. Ohutta by Ozone, Happy Jack, by Pandeck Jr., Rex by Achille and Stratton Girl by Winfield Stratton were the money winners in respective order of merit.

In the two-year-old class, Goldie Kip by Rudy Kip, Daisy Bell by Victor Brazilaian, Forest Boy by Royal Autograph and Teddy by the Hackney horse, Ben Smith were the money winners in their respective order in a class of eight entries.

The yearling roadster class had nine entries. J. A. Purdy's Lady Kip by Rudy Kip out of Nellie Oakes captured the red ribbon. A Brazilian colt captuted the blue and A. E. Trites' Abbot Kip by Ruddy Kip out of Grace Abbot, ran away with the white, while outside the prize winners were several other good Rudy Kips, Blomidons, Sedgeford Enterprises and Royal Autographs.

There were five pairs of Matched Roadsters. Spurgeon Gammon showed R. M. T. and Mamie Jay and was placed at the top of the list. J. C. Purdy's Billy and Molly by Abbot Wilkes were the next best pair. Lowther's Rose and Rosie by Dalhousie and Gertie K. and Nellie-Be-Sure by Harry K and Will-be-Sure shown by Blake Fisher captured the third and fourth prizes.

The Silver Cup donated by the Hotel St. Regis for the best Roadster horse in harness was awarded to Thompson's Mamie Jay.

CARRIAGE HORSES

made a flashy showing. Snowball's Model Performer and McFarlane Bros' Sedgeford Enterprise were the only stallions in their class. Model Performer won first money.

Five horses appeared in the section for mares or geldings over 15-2 hands foaled previous to 1911. They were all of unknown breeding, having been purchased in the open market by their respective owners.

In a similiar section for horses under 15-2 hands, Chas. Thompson's Brilliant by Brazilian, Geo. M. Holmes' Timbrook and A. P. Elderkin's Gypsy put up a three-cornered contest. Brilliant captured the choicest plum.

Mrs. J. R. Kennedy's Eva by Fashioner and Holmes' Bess, strove for the honors in the three-year-old class and Eva was decided the victor.

W. A. Humphrey, A. P. Elderkin, and G. M. Holmes' were the only matched teams exhibited in this class. The Humphrey team headed the list.

THE SADDLE HORSES

made a good showing. H. W. D. Armstrong, Fredericton, showed his splendid mare, Duchess by Sensation and was awarded the first prize. W. A. Humphrey, Moncton, showed Flirt and captured the second prize, while the third and fourth prizes went to

A. P. Elderkin's Pilot and Nick.

The saddle horse, ridden by lady, class had four entries. George McAvity's Senoretta, ridden by Miss May Holmes; J. C. Purdy's Gypsy, ridden by Miss Blanchard; and A. P. Elderkin's Gypsy, ridden by Mrs. Norman Christie came in for the monies. Another horse ridden by a gentleman masquerading in feminine attire, created a lot of amusement for the audience. J. C. Purdy's Gypsy, ridden by Miss Blanchard, succeeded in mounting a trifle higher than her contestant in the leaper class.

CARRIAGE HORSES IN HARNESS

Four entries in the section for Carriage Mares or Geldings 15-2 hands or over were placed as in the prize list found elsewhere in this issue. Mr. Armstrong's Duchess, the first prize winner in the Saddle Class, carried off the Silver cup donated by Col. H. Montgomery Campbell for the best combination saddle and carriage horse.

Mares or Geldings, 15-2 hands or under, made an entry of an even half dozen. McAvity's Senora and Senorita captured the first and second prizes. Elderkin's Queen and Purdy's Gypsy were the third and fourth prize winners. Senora captured the Terrace Hotel Silver Cup for champion horse in harness.

Four matched pairs, Senora and Senorita, Nick and Tuck, Flirt and Star and Dolly and Jessie won for their respective owners, Geo. McAvity, W. A. Humphrey, A. P. Elderkin and E. I. Peel, the coveted prizes.

McAvity's Senora and Senorita led the way in rhe Carriage Tandem section, followed in second and third places by A. P. Elderkin's Nick and Tuck and Gypsy and Pilot and in the fourth place by Mr. Purdy's Gypsy and Susie Wilkes.

Carriage four-in-hands were three in number. A. P. Elderkin had two sets of four and J. C. Purdy, the third. Prizes awarded in order named.

PURE BRED HEAVY DRAUGHTERS

In the section of the pure bred heavy draughters' class for mares or geldings foaled previous to 1911, McFarlane Bros.' Bess Spencer by Sir Spencer was sandwiched in between Logan Bros.' Baron's Fancy by Baron's Pansy and Pink Rose by Up-to-Time, Snowball's Moss Rose by Baron Balgreddin captured the green ribbon.

In the three-year-old section of this class Snowball's Miss May by Baron Balgreddin, C. B. Embree's Augusta, Logan Bros.' Susie of Homestead by Handy Andy and H. S. Pipes & Son' Princess Nora by Norseman made a good showing and Judge Richardson placed them in the order named.

Logan Bros.' Pink Rose and Baron's Fancy, McFarlane Bros.' Bess Spencer and Nell Bowie and Logan Bros.' Princess May and Soubrette made an excellent trio of matched teams. Honors were given in their respective order. Pink Rose, Baron's Fancy, Soubrette and Sue won the pair of Scotch Collars donated by the Amherst Hotel for the best four-in-hand.

C. B. Embree showed the only pair of three-year-olds in this class.

GRADE HEAVY DRAUGHTERS

were well represented. Fowler Bros.' Major and Minnie by Prince of Annick sandwiched Frank, an Ontario bred horse shown by R. P. P. Fraser in the over four-year-old class. W. P. Keilor's King and Queen by Harkness and Honesty were next in order of merit. The special prizes offered by the Canadian Clydesdale Association in this section were awarded in like order.

The three-year-old section had three entries. The Bishop, Vanderbilt and Coco colts won prizes in their respective order.

In the two-year-old class, a filly sired by The Bishop, was sandwiched in between a filly and colt sired by Prince Albert.

Royal Flash and Handy Andy were the respective sires of the first and second prize winners in the yearling class. The Clydesdale Association special prize in this class went to Judy by the Bishop.

Fowler Bros.' Minnie and Major, Robert P. P. Fraser's Frank and Joe, and W. P. Keilor's King and Queen won honors in the matched team class.

Robert P. P. Fraser captured the Silver Cup donated by Arthur Wallace, Pictou, for the best grade four-in-hand. Fowler Bros. were close contestants for this trophy.

The Clydesdale Association prizes for teams over four-years old were won by Fowler Bros.' Minnie and Major, R. P. P. Fraser's Frank and Joe and Frank Archibald's Jeff and Mutt. W. P. Keilor also showed his King and Queen.

Baron's Fancy

Champion Clydesdale Mare at the 1914 Maritime Horse Show. Owned by Logan Bros, Amherst Point, N. S.

Geo. M. Holmes had the only team, Rose and Judy, by The Bishop, younger than four years.

GENERAL PURPOSE HORSES

were shown by Fowler Bros., Courtney Lusby, Peel Bros, B. W. Rolston and R. P. P. Fraser. Peel Bros won the red ribbon, Fowler Bros. came in for the blue and white ribbons with their Clayson colt.

In the matched team section of this class Fowler Bros., Courtney Lusby and S. M. Stiles were the only exhibitors. Fowler Bros' Clayson colts led the way.

AGRICULTURAL HORSES.

This class brought out some very useful looking horses. In the over four-year-old section R. P. P. Fraser captured first and second monies with a pair of Ontario bred horses. A Vanderbilt mare shown by T. W. Keilor was awarded third prize and Frank Archibald's Jeff came in for fourth money in a section of nine entries.

Four year-olds were shown by Avery Smith and A. S. Etter.

In the three-year-old section, The Bishop, Vanderbilt and Coco were the sires of the three prize winners in the order named.

Seven entries were made in the two year-old section. Prince Albert, Vanderbilt and Albatross were the sires of the winners. The Bishop and Coco were the sires of other colts shown in this section.

The yearling section had six entries Baron Squire was the sire of the first and third prize winners in this section.

R. P. P. Fraser, Frank Archibald and Geo. M. Holmes were the exhibitors of the best pairs in the matched team section. T. W. Keilor also showed a very classy team.

PONIES

There was a good showing of ponies. G. W. Casson, Truro; Thomas Hooper, Truro; Marjorie Lusby and Richard McCully, Amherst were the exhibitors.

THE HAULING COMPETITION

created a lot of interest. There were a large number of contestants in the single and double events and each and every horse and team got down to do the very best pulling stunt in their power without any undue coaxing or coercion.

Prize Winners at the Maritime Horse Show

Thoroughbred Stallion, foaled previous to Jan. 1, 1911—1, George M. Holmes, Amherst; 2, Geo. Carvil, St. John.

Thoroughbred Stallion foaled on or after January 1, 1912—1, Geo. M. Holmes.

Thoroughbred Mare foaled previous to Jan. 1, 1911—1, Geo. M. Holmes

Thoroughbred Mare foaled on or after January 1, 1913—Geo. M. Holmes.

Diploma Best Thoroughbred Stallion any age—Geo. M. Holmes.

Diploma Best Thoroughbred Mare any age—Geo. M. Holmes.

Standard Bred Stallion foaled previous to January 1, 1911—1, Hammond Kelly, Charlottetown; 2, H. W. Ryan, Petitcodiac; 3, Frank C. Redding, North Sydney; 4, Dr. M. F. Ronan, Antigonish; 5, A. S. Etter, Amherst, 6, W. M. Chesley, Amherst.

Standard Bred Stallion, foaled during the year 1911—S. E. McGregor, New Glasgow; 2, Geo. M. Phinney, Sackville, N. B.

Standard Bred Stallion, foaled on or after Jan. 1, 1912—1, A. Charles Thompson; 2, Blanchard Brenton, Brentwood.

Standard Bred Mare foaled previous to Jan. 1, 1911—1, A. Charles Thompson; 2, E. I. Peel; 3, Robt. P. P. Fraser & Son; 4, W. W. Purdy.

Standard Bred Mare foaled during the year 1411—1, J. A. Reid.

Standard Bred Mare, foaled on or before Jan. 1, 1913.—2, George M. Holmes, Amherst.

Standard Bred Mare, foaled during the year 1912—4, W.A. Simpson, Amherst.

Diploma Best Standardbred Stallion any age—H. Kelly.

Diploma Best Standardbred Mare, any age—A. C. Thompson.

Hackney Stallion, foaled previous to Jan. 1, 1911—1 R. A. Snowball; 2, McFarlane Bros.

Hackney Mare, foaled during the year 1911—1, Mrs. J. R. Kennedy, Amherst.

Hackney Mare foaled on or after January 1, 1913—1, R. A. Snowball.

Diploma Best Hackney Stallion, any age—R. A. Snowball.

Diploma Best Hackney Mare, any age—R. A. Snowball.

Clysdale Stallion, foaled previous to Jan. 1, 1911—1 and 5, McFarlane Bros., Fox Har.; 2, R. A. Snowball, Chatham; 3, Hugh R. McMonagle, Sussex; 4, Wm. O'Brien & Son, Windsor Forks.

Clydesdale Stallion, foaled during the year, 1911—1, R. A. Snowball; 3, C. A. Archibald.

Clydesdale Stallion foaled during the year 1912—1, Frank Archibald.

Clydesdale Stallion, foaled on or after Jan. 1912—1, Logan Bros.

Clydsdale Mare, foaled previous to Jan. 1, 1911—1 and 3, Logan Bros., Amherst Point; 2 and 5, McFarlane Bros.; 4, R. A. Snowball.

Clydesdale Mare, foaled during the year 1911—1, R. A. Snowball; 2, C. B. Embree, Amherst; 3, Logan Bros.; 4, H. S. Pipes & Son.

Clydesdale Mare foaled during the year 1912—1, H. S. Pipes & Son, Amherst; 2, R. A. Snowball.

Clydesdale Mare foaled on or after Jan. 1, 1913—1, Logan Bros.

Diploma, best Clydesdale Stallion, any age—McFarlane Bros.

Silver Cup donated by Douglas & Co., Amherst, N. S., for the best Clydesdale mare, any age— Logan Bros.

Clydesdale Mare or Gelding, shown in single harness, foaled previous to Jan. 1st, 1910—1 and 3, Fowler Bros. Amherst Pt.; 2 R. P. P. Fraser & Son New Glasgow; 4, Frank Archibald, Truro.

Clydesdale Mare or Gelding shown in single harness, foaled on or after Jan. 1, 1911—1, Geo. M. Holmes, Amherst.

Clydesdale Mare or Gelding shown in single harness, foaled on or after Jan. 1, 1916—1, Geo. M. Holmes; 2, Chas. M. Shipley.

Clydesdale Team in harness, mares or geldings foaled previous to January 1, 1910—1, Fowler Bros.; 2, P. P. Fraser & Son, New Glasgow; 3, Frank Archibald, Truro; 4, W. P. Keillor.

Clydesdale Team in harnes, mares or geldings, foaled on or after Jan. 1, 1910—1, Geo. M. Holmes.

Percheron Stallion, foaled previous to Jan. 1, 1911—1, Charles Symes, Minudie, N. S.; 2, Roderique Horse Co., Petitcodiac; 2, D. S. Mann, Petitcodiac.

Percheron Stallion foaled on or after Jan. 1, 1912—Chas. Symes.

Percheron Mare, foaled previous to

THE MARITIME FARMER.

And Co-operative Dairyman

Registered Trade Maak

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisemen appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents 2 inches—First insertion $1.50; 3 inches—First insertion $2.25.

Contract rates on application.

May 5-26

SOME HINTS FOR THE HOME GARDEN.

Garden seed orders should be sent to the seedsmen as soon as possible. It is poor policy to delay the purchase of seeds until planting time. First, because later in the season work is too pressing to take time to decide what is best to get, and it is also essential that some of our seeds be sown within the next month or so.

With all the reliable seed catalogs coming to hand at this time of year, we can usually pick out a good selection of garden seed which will go a long way toward making our garden activities a genuine success.

We should be careful not to let the overdrawn pictures and descriptions in the catalogs lead us to select a lot of untried novelties in the place of tried out, standard varieties that are known to be satisfactory. It may be that the writer is somewhat prejudiced, but we have come to make a practice of throwing in the waste basket all those catalogs that widely overdraw the descriptions of plants beyond what we know to be possibilities. Another class of seedsmen that we always strike off our list are those who offer something for nothing. We know that it is much cheaper in the end to pay a fair price for seeds and get what we want than to either buy seed at bargain lots or accept free seeds that are distributed by the government. In either case we are tempted to plant something that we do not want, and that is in the long run expensive and, to say the least, unsatisfactory.

The best plan is to study our catalogs and decide between those reliable firms which have the varieties of the different species of vegetables and fruits which we think are pest adapted to our conditions. More gardens come to grief through the discouragement of the gardner having been led to try some startling new discovery in varieties that are being sold at high prices than in any other way. The scheme of the unscrupulous and even the honest seedsman, to make his best money, easy, is each year to introduce some novelty which may be sold at two or three times the price of the standard varieties. For instance, you will find in a nursery catalog Concord grape vines sold at from 4 to 10 cents a piece depending upon circumstances. In the same catalog you will usually find a lithograph picture and flowery description of some new grape that is very, very much superior to the old standard variety. This is probably sold at from 50 cents to $1 per plant. If we try these grapes out, side by side, in nine cases out of ten we will find that the oid standard variety is hardy, prolific, of good quality and desirable in every way, and that the new high-priced plant is either tender, unproductive or of poor quality. This is the history that repeats itself every year. For if we care to investigate the matter we will find that there are many varieties of every species of fruit and vegetable being sold constantly at a high price that are in a few years discarded and forgotten.

Another trick of the trade is to bring out some old standard variety under a new discription and a new name, and sell at a high price-

We do not wish to discourage the trail of these novelties and new introductions, as we find some of them desirable, and we believe that every one who gardens for the love of the work or cares to improve on present condition should try out in a small way those new varieties that seem promising, if it be done in an experimental way rather than to depend on them for a standard crop.

One important fact in selecting the seed for the garden should always be borne in mind. The market gardner selects those varieties which because of high yielding qualities or extreme earliness are desirable for the market, but there are nearly always better varieties which, though less productive, are more desirable for the kitchen garden because of better quality. For instance, some of our finest strawberries are well adapted to grow to be used immediately, but are absolutely worthless as commercial varieties because they are too soft to hold up on the market or to stand shipment. The same may be illustrated in cabbages. A certain variety of cabbage is of much more delicate texture and much more desirable for home use, but this cabbage will not sell for any more upon the market nor will it keep or ship so well as our common varieties; hence it is good for the home garden but not desirable for general market conditions.

GIVE THE COW A CHANCE

The Maritime Farmer has always recommended the testing of dairy cows but it has further modified this recommendation by the repeated advice that the dairy cow be given a chance before she is discarded. There is no question that many a cow has been sent to the shambles long before she was given an opportunity to prove her worth.

Many farmers, as well as their cows, should be submitted to a rigid test. There should be a test association for the dairy farmer as well as for the dairy cow.

Many a man is putting timothy hay and dry grain in front of his cows and expecting them do make him a profit, and complaining because they do not. If he would give them a fair chance, if he would give them feed from which to make milk and butter-fat, he would be treating them more nearly right and there would be less complaint of poor and inferior cows throughout the length and breadth of this land.

An illustration of this was given recently in the columns of Kimball's Dairy Farmer in an account of an experiment that has recently been worked out in connection with the New York Strte College of Agriculture at Ithaca. A herd that was picked up from an outside farmer made an average of 161 pounds of butter-fat in one year. The college kept a line on the production just how long enough to find out what the cattle were doing under the management of the farmer who was giving them what he supposed to be fair care.

The same herd was taken to the agricultural college and there put under scientific management, that is, the cows were given the kind of feed from which milk and butter-fat could be economically manufactured and the production was raised to 338 pounds of butter-fat per year per cow. Here is an increase of 167 pounds per cow. It shows what can be accomplished by giving the cows the right kind of feed and care. Of course every cow that is not a profitable producer will not respond in the same measure that these cows have responded, but there is no reason wby the dairy cows that are kept on the farms throughout the country should not do better than they have done and unquestionable they will do better if they are given an opportunity to prove their worth.

Test your own methods of handling the cows before you discard them. Give them a chance, give them an opportunity to prove their worth and then if they do not work out and show that they can produce profitable and economically, there will be time enough to dispose of them and fill their places with cows that are better and more profitable producers.

FARM WOOD LOT

People of today are more intent on clearing land, getting more acres into cultivation than they are in conserving the farm wood lot. Prof. Moody, of Cornell advocates the maintenance of a wood lot for three reasons. In the first place he claims that fuel is going to be a question of no little significance in the near future and the farm that can produce at least part of the fuel each year will have the question partially solved. Coal is going to rise in price, therefore we will naturally turn toward the use of wood.

In the second place the agerage wood lot can produce a share of the lumber that is necessary for the repairs and modifications on the farm year after year. With a portable saw mill it is an easy matter to handle the well grown trees so as to get a certain amount of lumber at least. Fence material is bound to become a subject of some concern. Naturally the cement fence post is durable and popular, but it is doubtful if it will ever entirely supplant the wooden post. It is doubtful if even the most enthusiastic advocate would advance such a theory. Certainly the farm wood lot makes the landscape more beautiful. it has a certain aesthetic value which cannot be overlooked entirely, it makes the farmstead more comfortaple for it furnishes a windbreak that turns the severe blasts of winter and if extensively enough cultivated it will have its influence on the rainfall of this country.

Guernseys in Prosperous Pictou County

(Continued from page 451.)

Two of the bulls that have been in use on Spruce Grove Farm were purchased from the Central Experimental Farm, Ottawa. The bull now in ute on the farm, Lord Trim II, (Imp), is two years old and was imported direct from the Island of Gvernsey, when he was three months old. Lord Trim II's dam has a record of 14,525 pounds milk testing 5.6 percent butterfat in one year and several of his grand dams are high record cows, so it may be reasonably expected that Lord Trim II's heifers will give a good account of their stewardship in the dairy.

Now litten! When we arrived at Spruce Grove Farm we saw a glimmer of light in the barn and there we went. On entering we caught Allie McKay in the very act of weighing the milk of one of the cows and his father was coming along the isle with another pail full of milk to take his turn at the scales. This fact coupled with the clean, sleek-looking appearance of the cattle and the tidiness of the stable impressed us with the belief that here was a firm who conducted their business on business principles.

A glance at the records revealed the following facts:—

Four of the Spruce Grove Guernseys have qualified in the Record of Performance and several others are now under test.

Daisy, as a two-year-old gave 6318 pounds milk yielding 282 pounds fat. This year as a three-year-old she stood first in her class in the Maritime Winter Fair dairy test at Amherst.

Rosy, a two-year-old, freshened last September is now running in the Record of Performance test and gives promise of making a good record. At the Pictou County Exhibition last fall she won first prize in her class and female championship of her breed. At the Maritime Winter Fair she too, headed her class in the test.

Dairymaid is also a Record of Performance cow. She gave 5316 pounds milk yielding 272 pounds butterfat as a two-year-old.

Lady Pauline II of Spruce Grove, a very neat, trim and good cow as a two-year-old, gave 6121 pounds milk yielding 359 pounds butterfat. At Amherst she stood second in the aged cows' class.

Another cow in the Record of Performance is Heiress. Her record is 8107 pounds milk and 418 pounds butterfat. After milking three months she stood fifth in the test at Amherst. Heiress was purchased when a calf from Glen View Farm, Sussex, and since she was two years old she has given a good calf every year, three of which were heifers.

Ruby is a fine large cow that stood third in the dairy test at Amherst. She was first in the aged cow class at Pictou County Exhibition last fall. In 1911 she was first prize three-year-old, champion Guernsey female and sweepstakes female over all breeds. She was also awarded a special prize for being the best dairy cow on the grounds. She is now doing good work in the Record of Performance test.

Messrs McKay have some very fine purebred heifers and a number of young bulls. Quite recently they sold four very nice bulls to head herds in various parts of the Maritime Provinces.

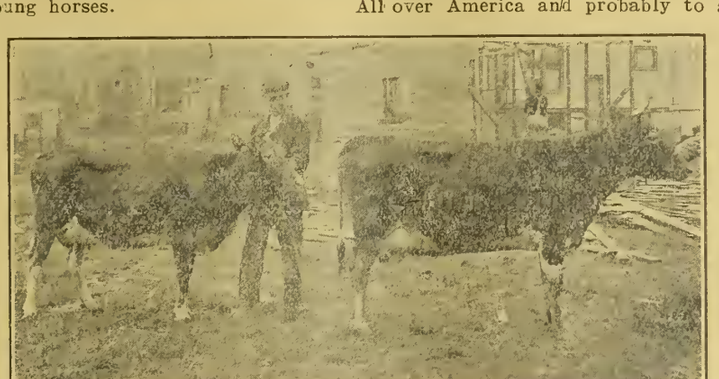
When Messrs. McKay have any stock to sell they advertise in the Maritime Farmer and they find it moves the surplus stock every time. This is another hint for you Mr. Stockman.

The cows are watered and fed twice a day. There is water in the barn, pumped in by windmill power but on fine days the cows are turned out into the yard, to water at the trough.

The milch cows are fed meal the year round. In summer they are pastured and when the pasture commences to fail a crop of green oats and vetches is ready for soiling purposes. The reader can take a leaf out of Messrs. McKays' note book in in this respect and plan now to sow early some mixed grains for soiling purposes for use when the pastures become parched and bare next summer and thus help to keep up the milk flow of the herd.

All the milk is separated on the farm. The skim milk goes to feed the calves and hogs and the cream is sent to the creamery twice a week in winter and three times a week in summer. For several years Messrs McKay lead the patrons of Scotsburn creamery in amount of receipts from cream delivered. Last season several other farmers put up a stiff competition for largest production and Messrs McKay came in in third place. This friendly rivalry is not a bad feature of the district. It just means that all concerned with try harder to be the top-notcher next season.

In the horse barns we saw a nice pair of Clydesdale mares which are used to do the heavy farm work, a nice driving horse and a couple of young horses.



Lady Pauline and Daisy
A pair of D. G. McKay & Sons' Guernseys

A nice flock of White Wyandottes add to the revenues of the farm. The eggs are disposed of through the egg circle in connection with the Scotsburn Creamery.

Mr. D. G. McKay did not neglect the education of his family. He followed the traditioos of the good old Pictou county fathers and gave his sons the advantages of an agricultural education.

Kenneth G., who is now Assistant Dairy Commissioner for the Province of Saskatchewan took a full course at the Ontario Agricultural College and took his M. S. degree from Ames, Iowa, after which he spent several years doing agricultural extension work in India.

Norman C., who is now district representative for Bruce county, Ontario, after completing a two years' course at the Nova Scotia Agricultural College took the remaining two years at the Ontario Agricultural College where he received his B. S. A. degree.

We are proud of the achievements of these two young men but we must admit we are doubly proud of the achievements of the other son, Allie, who has remained on the farm and is so heartily co-operating with his father in the development of one of the best Guernsey breeds in the Maritime Provinces, a good citizen and a live wire at all provincial agricultural meetings.

The Spruce Grove home under the careful management of mother and daughter is one of the most hospitable homes that one could wish to enter.

Mr. and Mrs. McKay have both passed the midday of their lives but their minds are clear and theirs is a contented lot. On the McKay paternal homestead they have lived for many years, striking examples of the traits of character industry, integrity and intelligence. What they have accomplished may be accomplished by others. The younger Mr. McKay's example may well be followed by young men who may perchance be contemplating the abandoning of the farm home life for that of the proverbial hewer of wood and drawer of water in a distant land. Like him the advantages of making good at home are within your reach if you grasp them.

Wanton Slaughter of Dairy Heifers Detrimental to Dairy Interests.

Since the last meeting of this association a condition has been developed that is working a serious injury to the dairy industry, viz.; the rapid rise in price of all classes of meats, particularly of beef, which is always a strong competition of dairying, has turned the attention of many patrons of cheese or butter plants to turning many head of cattle inth the present high-priced beef. All over America and probably to a greater or less extent in most cattle raising countries in the world is this ill-considered slaughter going on. Ontario was drained last autumn of all kinds of horned cattle including carloads of high grade dairy heifers. The same was true of Quebec and the Maritime Provinces, including our own.

In view of the steadily growing scarcity of dairy cows, previous to the above mentioned stampede, the ever-increasing consumption of milk and cream in our towns and cities and the call for milk to supply the different condensing plants along with the growing demand in our home market for creamery butter, where will the dairy cows be found to replace the natural shortage in the next few years to come? We must admit that in this country dairying needs to be pushed. Man's natural desire in farming, as in all else is to follow the line of least resistance. Dairying requires a little more thorough attention and skill than does the raising of beef and for this reason, farmers are only kept on the job when there is clearly more money to be made at it than any other line of live stock raising. How prone we as farmers are to follow the crowd, to drop a sure and certain line on the first intimation we have of something the other fellow raises taking an abnormal rise in price with the chances that by the time we have anything of consequence to offer on the market the product dropped will be more valuable than that we ran after.

I will give as my opinion that never in the history of co-operative dairying have the prospects for the industry been so bright; never has the out-look for coining high prices for dairy products been so promising. We all marvelled as the prices of meats and eggs rose in value to the present figure that buyers are to be found. Yet even at such fancy prices the available supply does not seem able to meet the demand for these life. So we can look to see milk and its products, which come more nearly under the line of necessities of life, so we can look to see milk and butter bring record prices in the near future. I cannot see how it can be otherwise. The loss of dairy heifers that are now being turned into beef will be felt more seriously in a year or two when they should be replacing aged cows. I do not take such an optimistic view of this matter as sounded by several prominent dairymen at the late annual meetings of dairymen in Ontario who thought that the poor ones were young and the same feed given to those left would make more net profit for their owners. If this were the case it would be a blessing indeed but I am afraid it is far from the facts of the case. Carloads of yearlings and two-year-old dairy bred heifers were sent out of many parts of Ontario and many more are being fed for the block this winter, even in our own province that is and should continue to be largely following dairying.

This regretable business is going on even in our own immediate vicinity, the banner dairy section of the Province. As many as six high grade dairy heifers are being beefed in one stable and the country is scoured as in time of famine for anything that is on the mend. Any animal able to walk to the slaughter house goes there—many of them just beginning to lay on flesh.

I am not faulting any farmer who feels inclined to raise beef. There is room on the Island for both dairying and beef raising, but the latter should be raised by the men now selling raw feed. I think it is a great mistake for any farmer having a good foundation of dairy bred grades to sell the young heifers and mate the herd with a bull of the beef type. What everybody is doing is often a good thing to leave alone. The consumption of any article generally decreases as the price goes to an abnormal figure, and supply is pretty sure to catch up by the time at least, that a present beginner breeds up anything to salable age for beef, with the probability that butter and milk will be then having their innings. A pound of beef by the carcass is a long way below a pound of butter yet with a real good dairy cow you can make one jutt about as cheaply as the other. And you can always be sure of as good a market for any surplus dairy cows you wish to raise as if they were fed for beef. Few men do justice in their criticism of their dairy cows. Aside from their work at the factory or creamery a small herd supplying a large family with milk, cream and butter usually earns more value than we thoughtlessly give them credit for. If many of us had to purchase what we take in the house we would look at the dairy industry in a different light.

Just what is best to suggest to stem this current of opposition, is hard to decide. If a man will not milk cows, we can't make him. The growing scarcity of labour is also a great hindrance to dairy development. However, where a man feels he needs to make all possible out of his farm, dairying must always ap-

(Continued on page 482.)

THE APPLE SCAB

An Address by Prof. L. Caesar, Before N. S. F. G. Assn., Kentville, January, 21, 1914

Apple Scab or Black Spot, as it is commonly called in some places, is one of the oldest diseases that attacks the apple. It is found in almost all temperate climates where moisture conditions enable it to grow. From the fact that it did much damage to the fruit last year and still more this year many persons may be inclined to fear that the disease is gradually growing worse and will year by year, be harder to combat. There is no evidence, however, that such fears are well founded and the mere fact that there is so little Scab in the year 1911 is in itself sufficient evidence to show that the real reason for such an outbreak of the disease in 1912 and 1913 was caused solely by the weather in each of these years being specially favorable for its development. How the weather determines the amount of Scab will be shown more clearly below. In the meantime let us consider for a moment what parts of the apples are attacked by the disease and the nature of the injury done to each.

PARTS ATTACKED AND NATURE OF THE INJURY.

The Scab attacks the leaves and leaf stems, the blossoms and blossom stems, and as these begin to form into fruit it attacks the fruit and of course the fruit stems. Occasionally the tender twigs are also attacked.

The injury done by attacking the blossoms and fruit and the stems that bear these is as follows:—

(1) By getting on the stems early it weakens these so much that it causes the young forming fruits to drop and thereby in very bad years like the last often brings about a very small crop.

(2) Fruit attacked is unsightly in appearance, will not keep well in storage, is liable if packed in moist hot weather to become attacked by a whitish or pinkish-white mound known as Pink Rot and of course is hard to market, having to be sold at a low price.

(3) If a large percentage of the apples in any district are scabby this tends to create an unfavorable impression among would-be buyers unless, of course, other producing countries have the same trouble, as is very often the case.

The injury caused by attacking the leaves and leaf stems is also sometimes very great. Sometimes these are so badly attacked that a large part of the foliage falls early in the season. I have seen Crab apple trees lose most of their leaves in June from a severe attack of Scab. New leaves, of course, soon take their place but even so the tree was, as one would expect, weakened in consequence of such a strain on its resources. Usually affected leaves do not fall to any large extent but instead the diseased areas in them gradually die,so that we will often find a badly affected tree with several dead brown or blackish areas on nearly every leaf. These areas vary in size considerably but are usually about one-quarter of an inch in diameter and roughly circular in outline. Even before the disease causes these areas to die it usually makes the surface of the leaf crumpled and line. Even before the disease causes uneven. Now, if we call back to mind that the food of a tree is manufactured in the green parts and only in these and therefore almost entirely in the leaves, we can readily understand that in proportion as the Scab attacks the leaves and causes dead areas in them it lessens the power of the tree to manufacture the sap taken up from the ground and the gases absorbed from the air into sugars, starch and other substances. This food once made is gradually supplied to the fruit, stem-roots, fruit buds forming for next year and to the other parts requiring it; what is not used in this way is stored up in various parts of the tree for next spring's use. Hence by lessening the power of the tree to feed itself the Apple Scab tends to weaken the tree and to prevent the formation of sufficient fruit buds to produce an average crop the next year. There are, of course, other causes besides this, such as lack of food in the soil, and overbearing which help to account for the scarcity of fruit buds.

On the twigs the Scab is not often seen. I have examined a few of your orchards and did not see any clear proof that the twigs had been affected. Whenever a twig is attacked the surface becomes ruptured and a black powdery or sooty substance shows up within the small areas thus formed.

LIFE HISTORY OF THE DISEASE

We have, I hope, now a good idea of the injury done by the Apple Scab disease but it is almost impossibly to understand the underlying principles on which the method of treatment is based without first studying the life history, just as no one could in our Province understand the necessity for spraying directly after the blossoms fall for Codling Moth unless he first knew some very important things about the life history of that very destructive insect. Apple Scab is caused by a fungus. A fungus is a very small microscopic plant which unlike other plants does not manufacture its own food, but gets it entirely from other plants; so that it is a parasite on other plants. The Scab fungus spends all its life in the outer tissues of the fruit, leaves and stems or twigs of the apple and gets its food entirely from these, thereby causing the injuries referred to above. It passes the winter in the dead rotting leaves on the ground, and possibly to a small extent on some of the twigs. It is evident, however, that nearly all the wintering over is done on the leaves alone. In the spring little black dots can be seen with a hand lens on these leaves and in these the spores which correspond to seeds are ready to send out their spores and if rain comes they are shot up into the air by a peculiar device which acts like a tiny pop-gun. Being very light and of course very small, some of them aided more or less by the breeze reach the opening leaves. Here they will do no harm unless the weather is damp, because they cannot germinate in dry weather. If, however, we have from 24 to 48 hours of constant wet or moist weather so that the spores are kept constantly wet they will each send out a tiny germ tube, which little by little works itself through the skin of the leaf or fruit and then soon after begins to branch and rebranch and absorb food just beneath the surface. In a few days it has got so far advanced that it begins to send up numerous little upright stalks which gradually burst open the skin and bear on their top a new kind of spore which we may call summer spores in constrast to the early spores formed in the rotting leaves. The black spots we see on the fruit are in reality nothing else than millions of these dark little microscopic spores. These are so light that the wind can carry them all over the orchard and therefore many of them will light on the leaves or fruit though most of them will light elsewhere and perish. Crop after crop of these summer spores can be produced from each spon on the leaves, stem or fruit. The disease gets started on the young opening leaves in the spring through the spores from the overwintering leaves on the ground, but these early spores shot up from the ground seem to reach in most cases only the lower leaves and it is not until the new kind of summer spores formed on the leaves in the diseased areas are produced and carried everywhere by the wind that the greatest amount of infection takes place and that the fruit is attacked.

CONDITIONS FAVORING SCAB DEVELOPMENT.

(1) From what has been said it will be clear that no matter how many spores of the disease there may be, the leaves and fruit will not be attacked without a good deal of moisture because spores will not germinate under ordinary conditions, unless they are kept constantly wet from about 24 to 48 hours Hence a dry spring and fall usually meaos no Scab.

(2) If trees are planted closely together or are not pruned fairly well to allow of good circulation of air and sunlight reaching them it is clear that any little shower under such conditions will take a long time to dry off and therefore the chances for an attark of Scab are greatly increased. Unnecessary windbreaks sometimes have the same effect.

(3) It stands to reason that the larger the number of leaves attacked the previous year the greater will be the number of spores in spring. Hence in a year following a bad attack of Scab there will be a greater opportunity for a bad outbreak if the spring weather favors it than in a year following a season when there is almost no Scab. There are always, however, a few leaves in the autumn attacked. One may not easily see them but they can be found in October if carefully sought.

(4) The observations of all students of this disease show that it is not merely moisture that favors it but cold. Hence what we have to fear is the times in the year when we have cold wet weather. It need not be raining but the leaves and fruit must be moist, hence fog or mist is as bad or often worse than heavy rains.

WHEN THE SCAB DEVELOPS MOST.

From what we have said about the ideal conditions and development being cold wet weather it is clear that we must expect the worst attacks during the period from the time the leaf buds are bursting up to the time when the fruit is from one-half to three-quarters of an inch in diameter or roughly speaking to the end of June. An orchard kept free from the disease that long will usually remain all the rest of the season unless there is an exceptionally cool wet autumn and then, as occurred in 1912, there may be another attack.

Some springs the disease will get a start soon after the leaf buds burst because there happens to be plenty of moisture at that time of the year for the germination of the spores; other springs the disease will make no headway until the blossoms are all out because the earlier weather was dry; and again in other springs the worst time for attack will be just after the blossoms have fallen because moisture conditions then have happened to be favorable. We see therefore that it is not possible to say that either the spray as the buds are bursting or the one just before blossoming or just after the blossom is the most important. We never know before hand which it will be, or whether all three will be equally important. We must use all as an insurance.

HOW SPRAYING CONTROLS APPLE SCAB.

Once a spore has germinated and worked its way beneath the skin, no spray mixture can reach it and it will continue to develop there. The way the spray wards off the disease is that if it s put on before the spores germinate it will prevent germination. So spraying prevents the Scab from starting but does not kill it once it has started. Last summer many of you doubtless found spot after spot on the apple where the Scab had died out in the warm weather and left merely a brown callous or russeted surface. Many thought this was a case of the spray having killed the disease but such was not the case. It was the warm, sunny, dry weather that killed the Scab in each instance. We cannot therefore emphasize too strongly the fact that spraying controls the Scab only by preventing it from getting a foothold and not by curing it.

Many will wonder how it is possible for any fungicidal spray mix-

Why Not Cut Off the Two Cars of Filler?

It takes 400,000 cars to carry American Fertilizers to our farmers and planters every season. Forty per cent.—2 cars out of 5—of this stuff is Filler, which requires 160,000 cars! Order less filler, higher grade and

Nitrate of Soda

for your active Nitrogen and save freight bills.

The greater productive capacity of high-grade fertilizers without so much filler means a greater outbound tonnage for railroads and greater purchasing power for farmers, so that railroads and everybody would be benefited.

DR. WM. S. MYERS, Chilean Nitrate Propaganda

NO BRANCH OFFICES 25 Madison Ave., New York

ture put on the leaves when they are the size of a ten-cent piece to continue to protect that same leaf until it is, say one and one-half inches in size. Let me try to explain this. Suppose we cover a round leaf all over with Bordeaux or lime-sulphur, the question will arise whether as that leaf grows the spray mixture will merely remain on this little area leaving all the rest uncovered. This is easily answered. The leaf grows all over, every part of the surface expanding throughout. This being so it is clear that the spray will not be in the same small area any longer but with the expansion of the leaf will be distributed here and there over the surface. This is a most fortunate state of affairs because otherwise one cannot imagine it possible for the fungicide to be of any value to the new growth if this took place merely at the tip instead of throughout the whole leaf and we should have to spray every few days. Again a fungicide does not kill by remaining in a dry state but by coming little by little into solution in the presence of the same moisture that would cause the spore to germinate. It is probably true that the spore itself in this moisture gives off a substance which helps bring the fungicide into solution. This solution of the fungicide brought about by the rain or moisture and the wet spores covers once more the leaf and prevents the germination of the spores. So that we can now understand that if a leaf is sprayed when it is quite small the spray mixture by being distributed widely over the surface of the leaf as it grows and coming to a slight extent into solution with each rain will continue to protect that leaf for a good many days but will of course become gradually too weak to do so after a time partly because of the rains and partly because of the great enlargement of the leaf itself. A knowledge of this fact helps us all to understand the remarkable value sometimes of an early spray.

Perhaps I should mention here that a good fungicide must possess these qualities:

(1) It must stick well to the foliage and not be easily washed off.

(2) It must come into solution with each rain to a sufficient extent to destroy the spores before they can germinate and yet not so quickly or completely as to lose its strength rapidly.

(3) It must not injure the foliage or the fruit to any appreciable extent.

(4) It must be moderately cheap and easily applied. Both Lime Sulphur and Bordeaux mixture answer these requirements to a very large extent but I shall not discuss their relative merits yet for a few minutes.

WHEN TO SPRAY FOR SCAB IN NOVA SCOTIA

I hope that those of you who consult my Spray Calendar will not forget that it was meant for Ontario conditions and not for Nova Scotia. In making the following suggestions for spraying in your province I wish you would think them over carefully and not adopt them unless you are thoroughly satisfied that they are suited to your weather conditions. I have based them largely on a study of the weather records for this year obtained from Truro, Wolfville and Kentville through the courtesy of Professors Brittain, Blair and the gentleman in charge of the Wolfville Station, whose name I have forgotten. I should have liked very much to have had the records of previous years to study and make sure that my conclusions were sound. I should also add that through the kindness of Mr. George Sanders, I had an opportunity to visit a number of your best growers and learn from them a good deal about the dates of the opening of leaf-buds and blossoms, and the falling of the latter.

A careful study of this year's weather record and of the dates of the bursting of leaf buds and blossoms would to my mind show clearly that Apple Scab got a foothold first throughout your whole valley between the 9th and 12th or possibly 14th of May. There was sufficient continuous moisture during this period to allow the spores from the ground to shoot up to the lower leaves as these were opening and to germinate before the dry weather came. From May 22nd to May 31st there was another very favorable period, for Scab development, as there were several continuous days of wet weather and no sunshine. Now to make things far worse the early crop of spores that had got started on the opening leaves between May 9th and 12th or 14th had by this time produced an abundant crop of summer spores that would be carried everywhere throughout your orchards and would therefore light on the opening blossoms, blossom stems and now get an ideal chance to germinate. Consequently many of the stems of the young fruit were so badly attacked that a great amount of it fell leaving a very poor crop. Of course, the frost that occurred around Kentville and some other districts on the nights of May 15th, 16th, 17th and 18th would destroy many blossoms that were out and had not yet been fertilized and it would therefore in these districts lessen the crop. However, most of the blossoms, I think, opened after these dates. There was doubtless some more new infection of the fruit and leaves after the blossoms fell but the weather record shows that conditions were not very favorable this year for further attacks in June. But someone will feel like asking "If the damage was done before the blossoms fell how did the Scab spots come to be in the fruit and get so large?" The answer to this is that several days, probably a week elapses from the time a spore germinates on a leaf or fruit before there is any sign on the surface that the disease is present, and even after the spots do begin to show they grow larger for sometime. Therefore, the injury is always done a good while before anybody sees it. If the part of the flower just below the blossom were attacked early the fruit formed from that would also of necessity be attacked.

From what I have said you will easily see that it is impossible this year to get perfectly clean fruit unless an application was put on before May 9th or 10th to protect the opening leaves from the Scab during the first wet period, and another application before May 22nd, that is just before the blossoms were bursting, to save the various parts from attack during the long wet period from May 22nd to 31st. But this year's conditions are different from those to be found some other years, and it would often happen that the weather conditions would favor a very bad attack of the disease just after the blossoms had fallen.

My suggestions then would be to make sure of clean fruit during the dangerous period of May and June by spraying as follows: 1st application just as the leaf buds are bursting or have burst, 2nd application just as the blossom buds are ready to burst, 3rd application just as soon as 80 or 90 per cent of the blossoms have fallen, and 4th application about ten days after the 3rd. If at any time, cold, wet, backward weather causes a long period between any two of these applications it will be well to get in an intermediate spray. If these suggestions are carried out I feel confident that you will be very pleased with the results, but of course the spraying in each case must be thorough. Good results should not be expected from poor work.

It needs no painting

THOSE neat sparkling roofs with their crushed mineral shining in the sun—you see them all over the country—they are Amatite roofs.

The fact that Amatite *needs no painting* means a great saving to those who use it.

It is also a great convenience not to have to paint roofs.

Many buyers have adopted the policy of using nothing but Amatite owing to this economy and satisfaction.

A booklet about Amatite will be sent free on request.

MIXTURES TO USE.

For the 1st application, I should advise the use of lime-sulphur at about the strength of 1.020 specific gravity which is about equivalent to the commercial lime-sulphur diluted 1 gallon to 15 with water. To each 40 gallons of this diluted mixture add 2 or 3 lbs. of arsenate of lead to kill biting insects. Bordeaux mixture (4.4.40) may be used instead of the lime-sulphur and with it, of course, the poison.

For the 2nd application, the one just before the blossoms burst, use either lime-sulphur 1.110 specific gravity (1 gallon of commercial diluted to 30 gallons) or Bordeaux mixture 4.4.40, gnd to every two gallons of either add 2 or 3 lbs. of arsenate of lead.

For the 3rd application, the one just after the blossoms fall, do not use Bordeaux mixture because of the danger of russeting the fruit badly; but lime-sulphur of the strength of 1.009 or 1.008 (1 gallon of the commercial diluted to 35 to 40 gallons) and add 2 lbs. of arsenate of lead.)

For the 4th application about ten days later use the same mixtures as for the 3rd keeping of lime-sulphur down to the lower strength of 1.008 specific gravity.

If the month of August is cold and wet there is likely to be some development of Scab or of Fly Speck or Sooty Fungus and to prevent this it will be wise to use the same mixtures as for the 4th spray when the condition of the weather seems to call for it. It is however, very hard to spray some heavily laden orchard at this time of the year because of the way the fruit bears down the branches and leave no room to go through with the machine.

It would perhaps be well to remind the growers that if the apples after they have got the size of marbles are sprayed on a very hot calm day they may become badly sunscalded.

IMPORTANCE OF SUNSHINE AND GOOD AIR CIRCULATION.

Seeing that continuous moisture for twenty-four hours or more is often sufficient to cause spores to germinate it stands to reason in the control of Apple Scab that good pruning and the removal of unnecessary windbreaks and avoiding planting trees too closely together, will be of considerable advantage. From what I have seen of your orchards I notice that some of them have been very closely planted and some are very poorly pruned though this is not true by any means of all. You can readily understand that an orchard where the trees are all close together or where the branches are very thick does not permit of sunlight to reach all parts or the air to circulate freely through. Such orchards are also very difficult to spray and to cultivate the work. In them also you are much more likely to get a bad attack of the so-calfed Fly Speck or Sooty Fungus. It will stand to reason therefore, that good pruning and anything that lets in a free circulation of air and plenty of light will help you in the control of Scab and will give more beautiful fruit.

VALUE OF METEOROLOGICAL STATIONS.

Since Apple Scab is so closely related to weather conditions as described above, I believe that the time is coming when our provincial and dominion weather men will be of inestimable value to us by predicting

DAIRYING.

Minutes of the Canadian Guernsey Breeders Association Held at Amherst.

PRESIDENT'S ADDRESS.

Gentlemen:—

I am glad indeed to meet you all again as breeders at this our Annual Meeting and to be able to state that we as an organization are making a healthy and satisfactory growth.

In some respects the past year has not come up to my expectations for we have not made a growth corresponding to that of previous years. I take this not to indicate that the Guesrnseys are losing any in popularity but rather that some of us have not attended to the registration of our animals for the total number recorded has not been equal to that of the past year. I firmly believe, however, that before the end of December comes around, there will be more animals recorded than ever before. This can be brought about by all the members giving it the attention it deserves.

We now have 723 animals recorded on our books which is an increase of 90 over last year. In the advanced registry we have 13 cows recorded as against 10 at this date a year ago. There are a great many more entered and a number will qualify before the end of this year.

One of the very brightest features of the year is the strong showing we have made at the shows and here, this need not be enlarged upon for you all have seen it for yourselves.

There is one point which I would suggest that you carefully consider and that is that we as an Association have to fight stubbornly for a place in the ranks among the other breeds. Compared with the Ayrshires, Holsteins and the others we have cattle that will hold their own with any breed in America but our Association is younger and smaller than most and the fight is to be a stubborn one.

In connection with that feature there is a point which we have neglected and that is obtaining members for our Association. There are Guernsey breeders, and more than many of you are aware, who are not members, who are doing very excellent work in the other province. In B. C. there are four large breeders who recork their animals in the American Guernsey Cattle Club Books, while in Ontario and Quebec there are several more. In addition to these, there are small ones in all these provinces. During the past year these men recorded about 20 animals, and we should have all these. If we want our organization to become what it should, we must make an earnest effort to unite all our Dominion breeders into one organization and ours is one whose early history will bear the closest inspection. In British Columbia, the Guernsey is rapidly gaining popular as they are here and if we can unite the East and West into one, we will be much strengthened and in time penetrate the central part of Canada where we are practically unknown at present.

We have not possessed all the ground that is ours by rights for we are chiefly a Maritime organization while we should be a Dominion wide one. This we will in time become.

In the nation to the south of us, the Guernsey has made most rapid strides and it is interesting to note that at the National Show in Chicago which closed last month that out of a total of 800 Dairy animals gathered from all parts of the great nation, no less than 213 of tbese were Guernseys, or more than ¼ of them. Does this look as if our "Fawn and Whites" were occupying any secondary place in America even today.

More than that, the fact may not be known to all of you, but the 4 year record for all breeds is held by the Guernsey cow who in that period gave no less than 26 tons milk and almost one and one half tons butterfat. Besides that, at the only contest ever held in America, where all dairy breeds were represented the Guernseys headed the list in the three following points:—

1st. Most net profit per lb. of food fed.

2nd. The highest average score for quality in butter.

3rd. The highest score for quality and color in butter.

As a breed to use in improving the average herd, we have one second to none and this is where a large part of our trade is to come in future, for at the present as never beforeis there a demand for high class cream for a city and creamery trade and the Guernsey will produce this more cheaply than any other breed in the world today.

Too much importance cannot be placed upon advanced registry work and I regret that our Maritime breeders are not running more cows this year. Our Parent Society on the American side was the first breed organization, to adopt a systematic testing of their cows. The growth in popularity there is largely due to this fact and now they have no fewer than 2313 animals which have qualified and many of them with remarkable records.

To me it seems that the points for us to consider, this coming year are, more attention of our cows; an attempt to get all breeders united to advance our breed and lastly a vigorous effort to do something in the way of advertising. We now have something which we can justly be proud of, and unless the fact is pushed home to the public, we will not receive the benefit of our work, and rereive the prices which we otherwise would.

As I stated before, this year showed a little dropping off in registration but I firmly believe that there is an influence at work which is soon to be of more importance in permanent growth than if we had made a very strong showing. I am also convinced that the day is not far hence, when we will have more members and more animals in the Maritime provinces than any other breed association and in time, I hope this will be the case all over the Dominion.

In conclusion, I wish to thank all those who have assisted me in any way during the past year and I sincerely hope that the one before us that of any other.

will show even greater progress than

I thank you all for your kind attention.—D. G. MacKay, Heath Bell Pictou Co., N. S.

THE VICE PRESIDENT.

Mr. Hugh A. Dickson, of Central Onslow, made a very interesting speech. He used figures to prove that the Guernseys are the most economical producers of milk and butter, mentioned the ever increasing demand for animals of the breed for foundation of herds and for bulls for grading up grade herds.

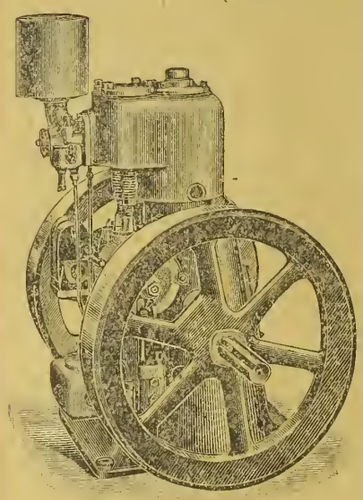
He also reported that two of his own cows had about finished a test with records of about eight hundred pounds of butter each in the year.

The Report of the Secretary and the Financial Report of the Treasurer were read and by motion adopted.

DON'T take our word only, but examine the Lister Engine at work alongside any other, compare its quality, efficiency, economy—In a word, let the engine speak for itself and you will become another delighted user of

THE LISTER
GASOLINE ENGINE

(British Made Throughout)



The most reliable, best quality and value.

Starts instantly — every time, with Bosch Magneto ignition—no batteries to run down and give trouble.

Self-oiling, no oil cups to fill—no oil to waste.

Self-regulating at all loads. No attention needed when at work.

Fitted with phosphor-bronze bearings throughout, the best money can buy.

No babbit metal to wear and run out.

In a word, the best quality engine ever seen in Canada

We have sold over 50,000 Melotte Cream Separators in Canada during 15 years. Ask any Canadian user how he likes the Melotte.

Well—**we guarantee** the Lister as good an engine as the Melotte is a cream separator. We can't say more.

MR. R. ROBERTSON

made some very encouraging remarks He noted the increase in the number of Guernseys in Canada as shown in the address of the President. He also suggested that the Members of the Association should give their special attention to the Dominion Exhibition to be held this year in B. C. and urged that a good exhibit be sent out from the Maritime Provinces to that exhibition.

MR. JOHNSTON

reported progress for the Guernseys in the Island of Cape Breton and showed his usual zeal in the welfare of the Association.

MR. T. D. BATES

congratulated the President on his excellent address. He stated that he had not been able to supply all of the orders he had received for Guernseys during the past year.

He complained that the Guernseys were not represented among the breeds kept at the Nova Scotia Government Farm at Truro and said that he felt it was unfair for any Government Farm or College to push any particular breed. He cited instances where he knew of farmers who had been induced to breed Holstzins by influence from the Truro College and Farm and who were now disappointed with results obtained from such crossing of the breeds and were again going back to Guernseys.

MR. JAMES McKENZIE

stated that as a breeder of grade cows who had had a wide experience, he wished to confirm what had been said of the good qualities of the Guernsey breed.

The Committee on Pamphlet work reported progress.

A Draft of a Resolution re "Bulls running at large" received from the Secretary of the Holstein-Freisian Association was read and after some interesting discussion was passed with a few minor amendments, as follows:—

DRAFT OF RESOLUTION RE BULLS RUNNING AT LARGE.

WHEREAS it is frequently reported to this Association that valuable pure bred cows hade been served by grade or scrub bulls not kept under proper restraint;

AND WHEREAS it is almost impossible under existing laws for the breeder of pure bred cattle to obtain adequate damages in case an action is brought in the courts against the owner of the underbred male;

AND WHEREAS it is difficult to maintain the purity of any breed of stock unless the females can be protected from the ravages of wandering males;

BE IT THEREFORE RESOLVED that this Guernsey Breeders' Association of Canada respectfully request the Minister of Agriculture in each Province to introduce legislation providing that any animal trespassing upon land fenced as provided by law may be detained by the owner of such land and held for all damage done thereon. That the owner of a pure bred cow which is gotten with calf by an ill-bred and unpedigreed bull unlawfully running at large or trespassing upon the premises of another may recover damages from the owner lessee or person in charge o

Use Salt that does make good butter - - Windsor Dairy Salt

117

such bull which damages shall be measured by the difference in the value of the cow for the purpose of breeding fine stock before meeting with such bull and afterwards.

AND BE IT FURTHER RESOLVED that the other Canadian Associations of Breeders of pure bred cattle be cordially invited to co-operate with this Association in the endeavor to secure satisfactory legislation in each province along the above lines, and that each individual member of the Associations be urged to bring as much pressure as possible to bear upon the member of the legislature for his constituency to the end that the request of the pure bred cattle breeders may receive due consideration.

BY MOTION H. W. CORNING AND R. M. JACKSON were appointed a committee to forward this resolution to the different Provincial Governments of Canada.

BY MOTION the Secretary was instructed to correspond with the Secretary of the Canadian National Dairy Show with a view to having a class of Guernseys for 1914.

President—D. G. McKay, Heath Bell, N.S.

Vice-President—Hugh A. Dickson, Central Onslow, N. S.

Directors—E. J. Johnston, Georges River, C. B.; T. D. Bates, Brookfield, N. S.; James F. Roper, Charlottetown, P. E. I.; J. Frank Roach, Sussex, N. B.; R. M. Jackson, Jacksonville, C. B.

Auditor—R. Robertson, Amherst, N. S.

Committee—D. G. McKay, H. W. Corning.

Director to act with President, Vice President and Secretary of Executive Board—E. J. Johnston.

Secretary-Treasurer—Howard W. Corning, Chegoggin.

Stable Sanitation.

Stable sanitation is just as important as factory sanitation. My idea is that the two should go together very largely, because I do not think any factoryman has any right to demand that his patrons should deliver to him clean, pure milk unless he has a clean and proper place in which to take care of it. At the same time the man who delivers impure or imperfect milk to a cheese factory or a creamery is robbing his neighbors — robbing them to a much greater extent than many people seem to believe. I believe the question of the improvement of the quality of our dairy products would be settled in a short time if the patrons of factories only realized how much they are losing by the carelessness of many of their neighbors in this connection, who deliver milk which is not in proper condition. While I was employed as superintendent over numerous factories, it was part of my duty to inspect the milk for adulteration. It was necessary to give a great deal of attention to this matter. If there was even a suspicion that some patron was watering or skimming his milk, the others were up in arms at once, and would raise no end of a row. I tell you, gentlemen, that for every dollar that patrons have been robbed of in such a manner they have lost hundreds of dollars on account of the milk not being properly cared for, and through the factories not being in the sanitary condition necessary to make the best of it.

Now I would like to go back just a moment to that question about feeding hay during milking time. It is not a good idea, from my standpoint, to feed hay just before or during the milking of the cows. It might be all right from the feeder's standpoint, but all hay contains a great deal of

(Continued on page 474)

THROW OFF THE WASH-BOARD YOKE

The washboard has been a hard taskmaster for generations, but now the washing machine has taken its place.

The New Century Hand Washer eliminates the back-breaking rubbing, thus making washing a pleasure instead of a hardship. It runs easily and does better and quicker work than the old method.

No other machine can be built on the New Century principle, because its features are patented. The rust-proof steel ring, that prevents warping, adds years of wear to its life.

See it at your dealer's or send to us for information.

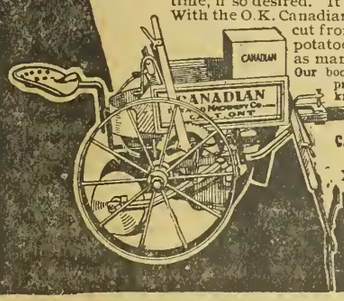
MONEY IN POTATOES

Properly grown, potatoes are one of the most profitable crops that the farmer can raise, yielding a revenue of anywhere from $125 per acre up. The way to make these profits is to grow potatoes *right*, and to use labor-saving machines at every stage of the work. The wise farmer will choose his machines very carefully, regarding their cost as an investment that will yield him dividends for many years to come. He will choose a machine that is well constructed, of the very best material, and that is guaranteed to give him years of satisfactory service.

O.K. CANADIAN POTATO PLANTERS

meet these requirements and more. The O.K.Canadian Planter is extremely simple in its operation, its cup-feed device handles the potatoes carefully, without danger of damaging them, it is adjustable to space the hills anywhere from twelve to eighteen inches apart and to any depth, and covers the seed thoroughly. It is equipped with an attachment to distribute fertilizer at the same time, if so desired. It is guaranteed in every respect. With the O.K. Canadian Seed Potato Cutter, you can cut from five to seven bushels of seed potatoes per hour, four or five times as many as can be done by hand.



Our booklet, "Money in Potatoes" contains pretty nearly everything there is to know about Potato Growing. We will be glad to send it to you if you will write for it. 29

CANADIAN POTATO MACHINERY CO. LIMITED

DEPT. E. 16

LIVE STOCK.

Fits in Pigs—How to Detect and Treat Them.

Fits in pigs are usually only of two kinds, apoplectic or epileptic.

APOPLECTIC FITS.

These are comparatively rare, but apoplexy is due to many causes, the principal of which are: Exposure to the sdn's rays, over feeding,rupture of an artery, causing compression of the brain, blows on the head, growth of a tumor, fright, clots in the cerebral arteries, an accident placing the animal for a time in a position mechanically preventing the return of blood from the brain, venous congestion and in fact, any cause onstructing the functional activity of the brain.

SYMPTOMS.

The attack is sudden, the animal is unconscious, breathing loud, labored, and slow, the tongue protruding and blackish and there is partial paralysis with occasional twitches, from time to time, generally on one side of the body, the eyelids are closed, and the pupils frequently dilated and insensitive to light.

TREATMENT.

This combines removal to a dark, quiet and cool place, cold application and douches to the head, mustard or white oils rubbed in the back of the neck, spine and extremities, and, if consciousness returns, administer four grains of calomel and twenty grains of jalap, or any domestic pill of an aperient character, doubling the human dose. The powder, or the crushed pill can be made into an electuary or paste with a little jam, and smeared on the tongue with the handle of a spoon, or mixed with two tablespoonfuls of milk, or, as the animal is not likely to struggle *being somewhat dazed), one or two ounces of castor oil may be given warmed. To administer these, elevate the head, make a pouch by ,pulling the cheek from the teeth, and slowly pour in without troubling to separate the teeth. The dose will then be slowly and easily swallowed. Or one may administer two ounces of Epsom salts, dissolved in five ounces of ale.

THE AFTER TREATMENT DEMANDS 3

Isolation, quietude, darkness, laxative food, and once daily in water or food the following: Iodide of potassium, five grains; nitrate of potash, thirty grains for about a week. This line of treatment in many cases will prevent recurring attacks, and will remove many of the possible after effects.

WILL THE ANIMAL PAY FOR TREATMENT ?

That depends on the value of the pig, the condition of the animal, fat or otherwise, the possibility of paralysis ensuing, whether the animal is barren or pregnant, and whether she was for a short os long time unconscious. All these factors must be considered and perhaps the owner may determine to have the creature slaughtered at the earliest opportunity before any treatment is adopted. The flesh may usually be sold for human consumption, as strictly speaking, it is not a disease, but in cases due to an internal mechanical cause.

EPILEPTIC FITS

These may occur amongst all animals, but man, dog and pig are more frequently victims than equines or bovines or ovine, probably because of their larger and more complex brains and higher mental developments.

GENERAL REMARKS.

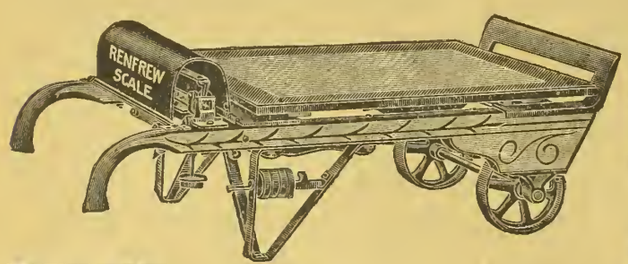
This disease has peculiarly attracted the attention of mankind from the earliest periods; our most ancient literature containing scattered allusions to it. The suddenness of the attack, the unconsciousness, the struggling, the equally rapid return to normal condition have invested this disease with a mystery and a halo of superstition, so that the early Greeks spoke of ;t as the "sacred disease," and the treatment of it was considered to belong more to the priest than the physician. This continued even to the middle ages and from the similarity of symptoms in man and swine during the attack, it was believed to be transmissible from one to the other. The miracle of the man, possessed by devils (epilepsy) being freed therefrom and sent to occupy the bodies of swine, reflects the general idea of that time. At the present time we must confess, in spite of all the researches that have been made, we are still in ignorance of the essential cause of epilepsy. Consequently, no really rational treatment had been introduced. Hereditary tendencies are assumed, and that is true, but the answer still hides out ignorance. At any rate, do not knowingly breed from any animal known to have fits. Other assumed causes are (1) an undiscovered auto-toxin, specially acting on the nerves, issuing from the base of the brain or front of spinal cord. (2) A tuberculous deposit in or on the brain, or some of the intermediate forms of trematode worms taking up their position there, and by their growth setting up pressure or irritation. (3) A reflex irritation produced by intestinal parasites, especially the small round worms. (4). Dentition: Previour to the eruption of first or second teeth, the pressure on the jaw and gums sets up inflammation, and this communicated to the dental branches of the great nerve of the face, sympathetically excites a nerve storm. The fit itself is not the disease; only a culmination of unknown previous causes. (5) Indigestion: This is also a probable cause, and perhaps more frequently than others. Fits may occur in suckling piglings, when the sow has been improperly fed.

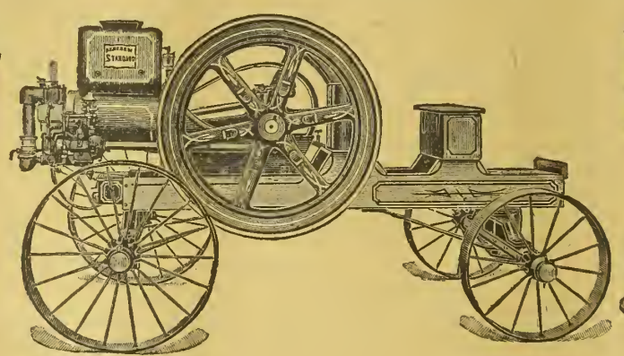
SYMPTOMS.

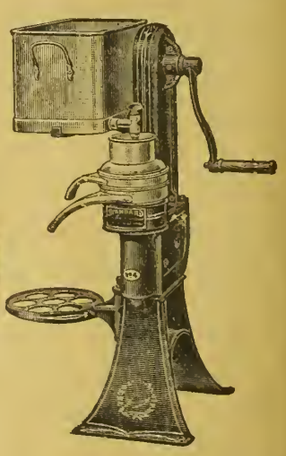
The most constant feature is the sudden onset of absolute unconsciousness, the victim neither hears, feels nor sees, nor can be roused by any means at our command. The head is drawn on one side, and generally the patient falls on its side, and the frame is agitated with violent convulsions. The teeth are clenched, the tongue is often bitten, and the urine or faeces are passed involuntarily. There are remissions, but often after a few moments the symptoms are renewed with violence. After a varying period of time they lessen in violence consciousness returns, and the animal will resume the occupation it was engaged in previous to the fit, but usually it seeks quietude and darkness, and sleep to restore the energy expended. There is for at least twenty-four hours a tendency to a recurrence of the fit. Many cases are far milder and of shorter duration. In feeding or playing, a young pig may suddenly stand still, or turn round in half circles, look dazed, stagger, and then quickly recover, the whole process not occupying more than five minutes.

TREATMENT.

During the attack nothing can be done, except possibly, removal from the vicinity of any hard body against which the animal might be bruised during the convulsive movements of the body. After recovery, a saline purgative should be given, in which thirty or forty grains of bromide of potassium have been added. The rest is a laxative diet, isolation and quiet If there is dentition trouble, search and extract supernumerary or crowded teeth. If the animal is effected with worms, give a vermifuge; if in poor condition, better feeding and tonics. If piglings are attacked during lactation with sow, feed her carefully, giv? castor oil and let her have a run twice daily for a short time, weather permitting, with her pigs. Of the medicines known, tending to prevent a recurrence of epileptic fits, nothing has yielded so good a result as the administration twice daily, of from ten to fifteen grains (depending on size) of bromide of potassium, continued for at least a fortnight or







Every Modern Farmer Needs These Labor and Money-Savers

Renfrew Quality In All Three

For weighing cattle, horses, hogs, sheep, feed, milk, butter, grain, groceries, etc. you need the Renfrew Handy Two-Wheel Stock Scale. Weighs from 1 lb. to 2,000 lbs. Weighs accurately on even or uneven ground. Government Inspector's Certificate attached. Strong, durable yet not heavy. Built especially for use on the farm. Write for our Scale Booklet and learn how this scale has paid for itself on the farm in less than three months. Sold on a Special Easy Payment Plan.

The Renfrew Standard Gasoline Engine is known as "the engine that starts without cranking." Runs so smoothly and so perfectly balanced it needs no wooden blocks under the wheels to prevent truck from crawling. Remarkable simplicity of construction makes it easy for a boy or girl to understand and run one. Has Governor of Fly-Ball Steam Engine Type. Very economical on gasoline. All styles and sizes from 2½ to 60 h. p. Write for our Engine Booklet.

Every modern farmer has heard about the Standard Cream Separator—the Separator that holds those remarkable close-skimming records at Government Dairy Schools. But everyone doesn't know why it skims so close—loses but one-tenth of a pound of butter fat in every 1000 lbs. of milk skimmed. The reasons are given in our new separator booklet which also explains the self-oiling system, the low supply can, high crank shaft, sanitary bowl, helicle gears, remarkable new-idea neck bearing, etc. Write for a copy.

The Renfrew Machinery Co., Limited, Head Office and Works, Renfrew, Ont.

Branches at Sussex, N. B. ; Saskatoon, Sask. Agencies Almost Everywhere in Canada.

FARMERS, ATTENTION !!!

We want a man in every locality in Eastern Canada to sell our big line of Household Necessities, Medicines, Extracts, Spices, Stock Remedies, Poultry Supplies, etc., — direct to farmers. Every one a household necessity, sold on Rawleighs' Pay-After-You-Are-Satisfied Plan.

YOU CAN MAKE

PER MONTH $100 TO $200 CLEAR PROFIT

over and above all expenses. If you can furnish team, write at once for our matchless offer.

NO DUTY TO PAY. Good freight service. Practically no competition. We are the only Company who owns and operates its own factory in Canada. Hundreds of our salesmen are making big money here in the West. Now is the time to secure good Eastern territory.

EVERY RAWLEIGH SALESMAN is backed by the service of one of the oldest Buying, Manufacturing and Distributing Organizations in North America. Established 19 years. Capital and Surplus over $2,000,000. References: Duns, Bradstreets, or any bank in Winnipeg. Write today for full particulars:

THE W T. RAWLEIGH MEDICAL COMPANY
90 GUNNELL ST., WINNIPEG, MANITOBA

three weeks. As it is rare to find any pathological changes in the brain or other organs, the animal may be slaughtered, and its flesh consumed safely.

Intensive Pig Keeping.

Pork in various forms, is regaining hold on the appetites of the working classes. It, therefore, behooves pig feeders to have their fat pigs ready for tne butcher for a young age—and this for two simple reasons: The fat pigs will sell more readily at higher prices and they will cost less per pound to produce than will the older and heavier pigs. A young healthy pig will eat more in proportion to its weight than will a heavier and older one, so that on this there is a saving of food, or rather it will utilize a larger quantity of the nourishment.

All the foods which are used in the manufacture of pork, says Sanders Spencer, in the "Smallholder," contain those properties which a young pig needs to build up its frame, in addition to the fat which the pig stores in its body or in its frame, whereas the matured pig, having built up its frame, has no use for certain constituents in the food, and these are mainly avoided or wasted. There are other advantages in this concentrated feeding of young pigs. You are able to fatten within the same sty a larger number of medium-sized than large pigs, and the fatting stage continues for a much shorter time, so that a larger number of pigs are fattened, more food is consumed, and a larger turnover at the same cost for housing, etc. This system may truly be called intensive pig-keeping, and thus it is in accord with the present-day fashion of conducting most businesses and carrying on most manufactories.

One secret of success in the fatting of pigs is to give them a mixture of foods. So many persons appear to imagine that all that is required in the fatting of pigs is to put into their trough a continual supply of some kind of food which may happen at the time to be most readily obtained, and which may appear to be the cheapest and in most general use for pig fattening.

Unappreciated Bull Calves.

Many years ago I visited in a neighborhood where a large Jersey breeder lived, or had his breeding farm. I called at the farm, and after looking at the 75 milch cows and heifers, I asked to see the calves. The manager showed me some 20 or 25 calves, all heifers but two.

"What do you do with your bull calves?" I asked.

"We have a man take them as soon as dropped, and dispose of them. We sell them for 50 cents each, and he is under obligation to kill them at a few weeks old."

"Why not let farmers have them to improve their herds of cows?" I asked.

"There is one that we have saved for a farmer. He pays us forty dollars for him.

"How much better is he than those you have killed?"

"Not any better than many of them. When we sell an animal to a man, he must appreciate its breeding and pay accordingly."

He went on to tell that within a year they had sold 24 heifer calves for one hundred dollars each.

I took the other bull calf home no matter on what terms. I could pay for neither certificate or pedigree (made some pretty stiff promises which I fulfilled later.

My cows were grade Jerseys. From these grades and the pure-bred bull, I raised two heifers that made 15 and 16 pounds each of butter a week. My neighbors raised good cows from him. The cows grew old and useless and were killed. I have never had their like since, but have often thought of those little bull calves killed because not appreciated. And when I have attended farmers' institutes and dairy meetings, whose object is to increase the output of butter and cream at less cost, I think how much easier and cheaper its object could be accamplished is these bukk calves could be bought by the state at wholesale, without pedigree, and distributed among the grade herdsof the state where most needed.

Very few, in proportion of the farmers of the state attend these farmers' meetings, but they are taxed to support them. Give him who "can't afford to spend his time at farmers' institutes" the bull calf for his share and see if he doesn't come out ahead.

Hogs Need Salt and Ashes.

A good supply of salt and ashes for hogs should not be neglected. If wood ashes are available, the hogs should have all they will eat. When not convenient to feed ashes, charcoal is a good substitute, and even soft coal will be eaten for want of something better.

Hogs are never injured by eating all the ashes they want, but it is not safe to give large quantities of salt to animals not accustomed to it. The salt and ashes mixture should be kept in a low box under cover where it will be protected from rain, and it should consist of about two quarts salt for each bushel ashes.

Many feeders add a few ounces of copperas to this ixture, Free access to such a mixture will preserve the health of the hogs, and sows which have had an abundance of such food rarely eat their young.

WELL THAT'S A GOOD JOB!
and it will last, too
The way to estimate the cost of keeping your house properly painted is to divide the cost of paint and labor by the number of years the paint will last.
Brandram-Henderson's "English" Paint
is the paint of longest service - the 100 per cent pure paint - because it contains 70 per cent Brandram's B. B. Genuine White Lead and 30 per cent White Zinc, ground in pure linseed oil, turpentine and dryer for all paints that can be made on a white base.
Figure its cost, not merely by the space a gallon will cover but by what it will keep covered. To the painter the formula of B-H "English" gives a feeling of confidence from the start.
A beautiful booklet of color-schemes is ready for distribution. Send for a copy. It's free.

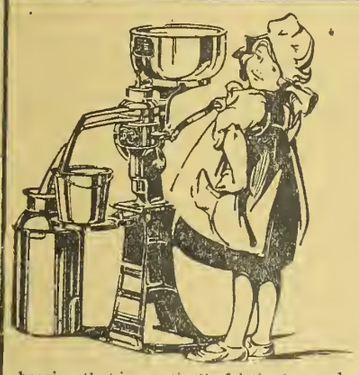
Ringing the Noses of Pigs.

Do they put rings in pigs' noses when turned to pasture? How are these made and put on?

Yes, this is a common practice to prevent pigs tearing the pasture pieces. Regulation pig rings can be secured at any agricultural supply or hardware store. They are put in with a special tool, known as a hog ringer. This can also be obtained at a hardware store. The cost of both to will be small.



"LIGHT RUNNING"

That together with close skimming, which is guaranteed in the *Empire*, is the point to look for in a separator, because light running means more than simply ease of turning the crank. The enemy of the separator is friction and light-running means absence of friction — and that means long life for the machine.

Among the reasons for the light-running of the

EMPIRE
DISC SEPARATOR

It has fewer moving parts and fewer bearings, its bowl is 20% lighter than others, it has a unique, exclusive, three-ball bearing supporting the bowl spindle. This three-ball bearing is found only on the *Empire*—it supports the bowl on a bearing that is practically frictionless and yet keeps it perfectly centered—something that is impossible with any other bearing in use.

Mail the coupon attached for our booklet on separators and learn more of these exclusive *Empire* features. A liberal allowance will be made for your old machine on the price of an *Empire*.

The *Baltic* separator, the smallest of which sells at $15, fills the needs of very small dairy herds.

Would you like information about the famous "*Sta-Rite* Gasoline Engine?"—"They start right and Sta-Rite."

THE HORSE.

Grooming and Drugs.

If horses got more efficient grooming—"dressing", as the professional stableman prefers to call it— there would be fewer complaints about "surfeit," pimples, blotches, hidebound, roughness and other cutaneous disorders that affect the health and spoil the appearance of the horse, because the skin would be better enabled to perform its functions of removing effete material from the system. There would also be less demand for alterative and "condition" powders, which, in the majority of cases, are only rendered necessary through the skin becoming unhealthy, owing to its neglected condition. Bearing this in mind, no mercy should be extended to the attendant detected in using "coat-shiners" in place of honest strapping. Agents such as sulphuric acid, "sugar-cake," and arsenic should never be used for the purpose of saving labor. It is idle to pretend that they are of no use for this purpose—the lazy groom and the horse-proud carter knows better—and there is no doubt that they exercise a temporary effect in direction of producing a sleek coat with a small expenditure of labor but, if persisted in, the animal eventually goes all to pieces. The horse is slowly poisoned if the drugs are continued, and falls off in condition when they are stopped after he has become accustomed to receive them. Many of the complaints that are so common about horses, and especially farm horses, doing badly, and falling off in condition and appearance, when a new carter has taken over the charge of them, are due to the fact that the previous carter has drugged them and the new man has not learned the trick. We have had many applications for advice from men who have been threatened with the 'sack', and roundly accused of "giving the 'osses something." when it was their predecessor in office who had done the "giving" and the mischief. A great many cases of mysterious deaths, and more that are erroneously put down to colic or gripes, are the result of poisoning from the reckless or ignorant use of arsenic, oil of vitriol, and nitre. It is seen that there is an improvement on using these drugs, and then comes in that line of reasoning so common among those possessed of no medical training—if a little does good, more must do more good. Further, the carter does not understand the cumulative properties of arsenic, and that a fatal termination commanly results from even medicinal doses long continued. Every horse owner should personally and pointedly forbid the administration of any drug or medicine to his horses, unless by his express direction and consent, and he should, by taking a quiet look around the stables in the absence of attendants, see that there are no papers or bottles about that contain, or have contained, drugs. The corn-bin which the carter takes care to keep locked, under the pretense that his oats are stolen, is a favorite hiding place for such things, and it should be frequently inspected. Attendants will give these things, and not even the terrors of the law and the risk of punishment will always deter them.—English F. & H.

A GREAT SCANDAL

Big Efforts to Hush the Matter Up--- The Truth Out At Last . . .

Erom exhaustive enquiries made during the last few months we find there have been a number of patients kept under conditions which to say the least of it, is a great scandal.

We trust our readers will bear with us for a moment. The facts of the matter are these, there have been some thousands of cases where horses have been suffering from distemper, coughs, colds, kidney troubles, contracted hoof, swellings, splints and enlargements of all kinds, and in some cases no attempt has been made to relieve their sufferings, their owners either being indifferent, or where they have thought at all about their animals have had recourse to cheap so-called remedies, of which there are unfortunately a few on the market, but which, while some may give a little relief temporarily, cannot from the nature of their ingredients give permanent relief or effect a cure.

It is high time in our opinion that something should be done to bring this state of things to an end, and with this in view we are about to take drastic action, to bring before every owner of horses that wonderful remedy known to all as "Dr. J. Woodbury's Horse Liniment,"

This remedy has been used for years throughout the Dominion during which time it has been used in hundreds of cases, comprising distemper, coughs, colds, kidney troubles, contracted hoof, swellings, splints and enlargements of all kinds, and in no case to our knowledge, has "Dr. J. Wood' ury's Liniment" failed to first relieve and then to cure the above mentioned complaints.

Every owner of horses should, if they have not already got a bottle of this Liniment in their stable immediately procure one. It is the only guaranteed remedy we know of, and it is a cheap form of insurance, and it will be found, that, if used immediately any symptoms of any of the above diseases appear, to give immediate relief, and probably save tremendous expense, probably the life of the horse as well.

Dr. J. Woodbury's Horse Liniment is sold by Stores and Chemists throughout Canada, but should your Storekeeper be out of stock he will procure it for you, and if you should find any trouble in getting a bottle, don't delay for an instant in mailing 25 cents and a bottle will be immediately forwarded you.

Treatment for Bots in Horses.

The following treatment has been tested on a large number of animals and proved successful by the United States Department of Agriculture. It is said that it will remove bots with in twenty-four to forty-eight hours. The day preceding the treatment a small amount of hay and a moderate amount of oats are given in the morning; in the evening, food is with held and a purgative given—Barbadoes aloes, 1 oz., or raw linseed oil, one pint. The day of the treatment at 6 o'clock in the morning give 3 drachms of carbon bisulphide in gelatine capsule; at 7 o'clock repeat the dose in the same manner, and at 8 o'clock give the third and last dose, making in all 9 drachms of carbon bisulphide in three gelative capsules. The above treatment is for the adult horse. For a yearling colt half the quantity of carbon bisulphide used for a mature horse will give the desired results. If properly administered, the gelatine capsule reaches the stomach intact, but soon dissolves, and the carbon bisulphide rapidly evaporates, suffocating all bot larvae and other parasites with which it comes in contact, but not injuring the horse. Worms are quite often expelled as well.

Brushing or Over Reaching.

"Over-reach" is an injury resulting from the inner part of the hind foot striking the heel or outer side of the fore coronet. The subjects that over-reach are generally fast horses that are good steppers, and the accident happens when they are weak or leg weary. When tired, the feet are moved irregularly, and the foot that inflicts the injury is advanced to its place before the other has been lifted. Unless arising from faults in conformation, the animals that inflict any of the above-mentioned injuries on themselves are generally young, immature and out of condition. They may be sleek and fat, but their muscles lack tone, and being soft they are easily fatigued by rapid work or long journeys. The indications are to bring the aninal into a better state of strength, by good feeding, regular moderate work, or perhaps by the judicious use of tonic medicines. It is to alterations in shoeing that most people look for a cure, but the smith can do but little to remedy the evil except in conjunction with an improvement in condition. Little can be said about shoeing, since each case requires to be treated on its merits; but generally, the most that can be done is to keep the striking foot rather bare at the part, to use bevelled shoes, and to remove them frequently, say, every three weeks. Care must be taken about the wound or bruise, as quittor and false quarter commonly supervene on over-reach.

Working Young Horsea.

Some farmers are apt to be a little too anxious to get their young colts to work. Draft colts of good size should be broken to work when two years old. Light work will be more beneficial than harmful, providing they are carefully handled. During the spring and summer they can be used occasionally to rest the brood mares and in this way they will almost earn their keep.

There are several advantages in breaking young, when the colts are from one to two years old. The colt seems to learn and is more easily handled than when he is older. Once well broken he can be turned out again to pasture with no danger that he will forget what he has learned. Of course, when broken at this tender age the colt is not ready to commece steady work when his education is completed. He should be accustomed gradually to work and the tasks to which he is set should be chosen with regard to the good they will do the colt rather than his owner. The draft colt is not ready to take up general farm work until at least three years old, and it is better that his strength should not be taxed severely before he is five.

Hitch the colt at first with an old gentle horse. Two colts should not be hitched together, as they worry each

other and do not learn so readily. Place strong well-fitted harness on the colt and take care that he is not frightened the first few times. If allowed to run or to get the advantage while scared the colt will always have a fear of the object of its first scare. If the colt is hitched with a gentle horse that does not scare the driver will not have much trouble. —W. F. Purdue, in Breeders' Gazette.

The Bones of Light and Heavy Horses.

Definite information concerning differences between the bones of light and heavy horses has been obtained by B. Hardt, of Jena University, Germany.

Upon chemical analysis of many specimens of metacarpus or front cannon bones, he found that on the whole the bones of draught horses contain more organic matter and less mineral matter than those of light horses. There are also some minor differences in composition, but he concluded that there are greater differences in form and strength than in the chemical composition of the bones of the two types. This supports the common statement of the horsemen, that the bones of light horses are generally harder than those of draught horses, for the hardness of bone and its strength are known to increase with additional percentages of mineral matter.

Since there is a general co-ordination of structure throughout the body the texture of the skin and hair furnishes an index to the character of the bones. Smooth skin and fine hair are generally possessed by light horses, and particularly by those retaining sound legs to old age. When the same quality of hide and hair is found on the cannons of a draught horse, it is a fair assumption that there is a corresponding density of bone. The reputation of such horses for soundness of underpinning supports that conclusion.

Forging.

When the toe of the hind shoe strikes the under surface of the fore shoe, which it may do at any point between the toe and heel, the horse is said to "forge", and forging is due to defective gait or action, it may be from faulty conformation, lack of condition, or occasionally from defective or careless shoeing. The sound is very unpleasant, especially to the sensitive man who realizes that the horse he is driving is over-tired or lacking in condition. The majority of people attribute forging to bad shoeing, and look to shoeing for a remedy, but what happens is that while the horse is making the round of the different forges in the district he is getting into condition, growing older, and better fit for work. The "forging" then ceases, and the last man who did the shoeing gets the credit. Most horses that forge are young and recently broken, or old and out of condition, and forge only when tired or over-driven. This should always be kept in mind while trying the effects of altered shoeing. Many horses that forge wear away the toe of the hind foot, and occasionally the wall quite close to the coronet, exposing the sensitive structures and causing bleeding. There are horses that forge when they have no shoes on. There are contrivances for deadening the sound, which is, of course, not a cure, and there are several special shoes for horses that in forging wear away the wall. Charlier shoes in front are sometimes a cure, but always remember that corn and oats, steady driving and having the horse in hard condition are great aids to improved shoeing.

International Stock Food

You certainly do need it during Calving Time.

You need INTERNATIONAL STOCK FOOD for the cows and you need it for the calves.

It will keep both cows and calves in good flesh and keep their digestion sound. It tones up the system, invigorates and purifies the blood, etc., and removes all taint of disease from the milk. It will help very much in bringing cows safely through calving. INTERNATIONAL STOCK FOOD is good for all kinds of stock. We guarantee that it will make your colts, calves, pigs, shoats, and lambs grow rapidly and keep them healthy and thriving all the time.

Tell us how many head of stock you own and we will send you, free, a copy of our $3,000 Stock Book. You need it on the farm. International Stock Food and Veterinary Preparations, also Poultry Food and full line of Poultry Remedies are for sale by dealers everywhere. If your dealer cannot supply you, write us direct. Every preparation is sold on a spot cash guarantee basis to give satisfactory results or your money refunded.

FREE—FARM ACCOUNT BOOK

Bickmore's Farm Account Book will be sent free to any farmer who will tell us who and where he is. This book is arranged to keep all accounts in simple form—more simple and certainly more practical than trying to remember them; shows what to charge against crop production; has a laborers' time record; and section for personal accounts. **64 pages, for ink or pencil.** Not a cheap affair. Its quality is in keeping with **BICKMORE'S** Gall Cure, a soothing, healing salve, the old-time reliable horse remedy. Horses are now too valuable and too high priced to take chances of losing their services. **Bickmore's** Gall Cure heals and cures **Harness and Saddle Galls, Rope Burns, Cuts, Scratches, Grease Heel,** etc. You don't have to lay the horse off. **Bickmore's cures while the horse works.** Great thing for sore teats in cows. The work-horse trade mark on every box. None genuine without it. Be sure to ask for **Bickmore's** Gall Cure when you go to buy and do not take a substitute. Farm Account Book is ready. Send today.

POULTRY.

A Three-Line Job—Poultry, Bees and Fruit Make a Pleasant and Profitable Combination.

Thos. F. Rigg writing in the Springfield, Mass., Farm and Home, says:—

"Poultry, fruit and bees in combination certainly give one the working material for the best and most workable three-line job. It is a combination with which the laws of nature harmonize completely and most genially. The man who properly handles poultry, fruit and bees is sure of a good income. If he does not properly handle them he is very apt to get stung.

"The products of the poultry yard the orchard and apiary are a daily necessiry in every one of the millions of homes in this country. I would like to know how any woman could keep house, and her husband, without her daily supply of eggs. Then, too, no home is complete without some of the products of the orchard and berry fields. And who does not want and demand the nectar of the flowers in the form of delicious honey? So you see, the man who is producing eggs and poultry and fruits, and honey has an established market awaiting his goods. No need of him to spend money in educatiog the people to use and buy his products.

"In common with all household commodities these products will probably never be cheaper than they are now, but rather that they will advance in price. This means that for the man who knows how, the poultry yard, the orchard and the apiary will yield a substantial profit. This being true, it does seem as though this three-line job ought to appeal strongly to a very large number of people in every section of the country. And it does. While it is true, that there are a few sections of the country especially adapted to the successful growing of fruit it does not follow that for the three-line job man these sections offer the greatest profit. The man who is going to establish a large commercial orchard and specialize on apples or peaches would be wise to chose one of these sections, but the man who hopes to establish such a businesss as we have under consideration will do well to seek other local ties. Why? Because his is an entirely different proposition.

"He will have something to sell every day. The housekeepers will look to him to supply the homes with poultry, eggs, fruit and honey regularly and in small lots. Then, too, in the fruit centers prices are lower. To illustrate:

"Last season I saw small fruits selling at unprofitable prices in a noted fruit centre not far from Portland, Me. A few days later I was in Portland and looked up the market. Small fruits were scarce and very high in price. The few growers there were reaping a rich return, while over in the celebrated fruit district the producers were selling at a loss. And the truth of it is that the hardy small fruits, strawberries, raspberries currants and gooseberries can be grown near Portland just as successfully as in the most noted fruit sections of America. I give this instance to show why I have made the above statement as to choice of locality. This same condition exists over the greater portion of this country—the markets are not well supplied. It seems but natural that men should consider far-off fields as the most profitable, but the man who is going into poultry, fruit and bees had better consider his own locality.

"Were I to choose a location for such a farm I would not have to go far, I am sure, no matter where I was located. I would prefer to be near a thriving manufacturing town. I would prefer such a town to a city. The city is the dumping place of a vast amount of fruit and prices frequently rule low. I would prefer the prosperous town to the city, not only because of this fact, but for the further reason that in the town I could more easily deal directly with my customers. I would, too, cut out all transportation charges and middlemen's profits.

"I would be very careful in the selection of the soil. A sandy loam with a clay sub-soil is ideal for the production of fruit. It is warm, friable, retains moisture, while at the same time the surface is not too wet. Such a soil is well adapted to the successful raising of poultry. Clovers naturally grow to perfection on such soil and the bees must have clover fields in which to gather the nectar which we take from the hives in the form of honey.

"I would, so far as the fruit is concerned, specialize on small fruits, such as strawberries, raspberries, currants and gooseberries. If in a specially favored apple country, I would have an orchard set to winter apples of not more than two varieties. The apple orchard would be the home of the poultry. It is an ideal place for fowls and growing chicks. Then, too the fowls greatly benefit the trees by constantly fertilizing the soil, provided there are not too many of them.

"I do not know of any section of the country where such a little farm, properly managed, would not pay big dividends, not only in dollars, but in health, comfort and contentment. It ought to appeal to so many men and women who are wearing out their lives in the tireless, carushing grind of the city life. It should, too, appeal to all land owners near thriving towns. Life's struggle for the vast majority of people is to be constantly harder as time goes on, and while this little farm of ours will not be without its care and perplexities and troubles, it will insure to the willing and faithful workers safety against the hardships of the world."

Hatching and Raising Chickens by an Artificial Method.

We have always kept a few hens to supply our own table with eggs and poultry, and have observed that the usual custom is to raise what chickens are necessary to get the pullets one needs for the coming year, killing off the cockerels as soon as large enough for broilers. This way of doing business is not very profitable, from our viewpoint, as the cost of the day-old chick, together with the loss and feed necessary to get them to the broiler stage, leaves little margin for labor expended.

We resolved to begin our operations with a different idea in view, namely, keeping hens as others have kept turkeys, wintering only what hens were necessary for breeding stock, raising the cockerels and pullets to maturity and marketing the former when roasters bring a high price, and selling the pullets for egg producers in the early fall. We have tried this method for several years, and proved to our satisfaction that for labor and capital expended it is extremely profitable.

We began the year with 23 fancy White Wyandotte hens and two large vigorous cockerels, choosing this breed because of their prolific laying qualities, as well as attractive appearance when dressed—yellow legs and skin and no dark pinfeathers. Our particular strain is also valuable on account of size, pullets weighing as high as nine pounds and cockerels 11 pounds.

The 244-egg incubator was started February 19 and kept in operation until May 15, giving us 600 strong healthy chicks, a little over 60 p. c. hatch. Of this number we sold 328 as day-old chicks at 15 cents each, and of the remaining 280 we raised to maturity 247, or 88 p. c. of the original number. The chicks were put into outdoor brooders.

FEEDING THE BABY CHICKS

The first food given when 24 or 34 hours old, was bread crumbs moistened with milk and was continued, one feed a day, during the first week. Fine grit and wheat bran were kept before them from the first, and they were given as much chick feed as they would eat up clean three times a day.

Once daily for three weeks we fed hard-boiled egg, shell and all, mixed with pinhead oatmea,. Caution should be used in feeding the egg. One egg for 25 chicks at first is all we have found safe to give them.

After three weeks old they were fed three times daily, gradually changing from chick feed to fine whole grains and a liberal proportion of cracked corn, with bran and growing feed constantly before them. This was their diet until maturity, the only change being that the grain was given in two feeds instead of three when about six weeks of age. At that time they were taken from the brooders, having been gradually accustomed to go without heat, and placed in a building 14 feet square, which was their shelter at night during the summer.

In this building we placed a large dry feed hopper which holds 200 pounds, and we have seen our 250 chicks empty it in one week. This box was not allowed to stay empty, as plenty of food is necessary for good growth.

The chickens were allowed the free range of an orchard of about five acres, which contained a stream of running water. We find it quite simple to feed poultry on free range, as they can pick up the necessary elements for a balanced ration.

THE COCKERELS SPECIALLY FATTENED.

Some time before marketing the cockerels were confined in movable runs and fed g specially fattening ration, together with milk, until they were large enough to dress 6½ pounds on the average. All the pullets we did not need for breeding stock the next year were ready to lay in October and sold for 30 cents a pound live weight.

Itemized account for the year is as follows:

Expenses—Grain, $168.55; eggs for hatching to introduce new blood, $20; kerosene, $5; total, $193.55.

Receipts — 119 dressed cockerels, $164.02; seven breeding cockerels, $28; 76 pullets, $109.22; 220 day-old chicks $48; dressed fowls, $21.69; eggs $72.78 increase in value of stock on hand, $70; total, $513.71; profit for year, $320.16, or $12.80 per head.

A FEW LESSONS FROM EXPERIENCE.

Eggs should not be kept over 10 days before incubating.

Brooders and henhouses should be sprayed and then fumigated with sulphur.

Chicks must be hatched early and rapid growth promoted, in order that cockerles may dress over five pounds in August and September, when the prices are highest.

Feed breeding stock plenty of green food of some kind so that we may have fertile eggs.—A. E. Sherburne in N. E., F & H.

Kow to Feed the Ducks.

As soon as possible after the young ducks are hatched and dry I take them away from the hen and place them in a box near a stove and cover them. They get their first feed when 36 hours old. This consists of bread with as much warm milk as it will soak up. Over this I sprinkle a very small amount of fine, clean sand

I keep water before them in small fountains all the time, but am always careful not to give them cold water, which will cause cramps. Fountains prevent them from getting wet and chilled. I feed bread and milk for the first 10 days every three or four hours and am careful about the feed not getting sour.

After they are 10 days old I feed

PEERLESS-PERFECTION
The Fence That's Locked Together
The attacks and onslaughts of animals can't faze it. It's strong, yet springy. Manufactured from Open Hearth steel galvanized wire. When made by this process, impurities are burned out of the metal, removing one of the chief causes of rapid corrosion or rusting.
Read What Others Say
Gentlemen:—There is no fault to find with your fence. The fencing I put up 4 years ago is just as good as the day I put it up, showing no sign of rust, and giving good satisfaction. The Peerless stands the test better than any other make that I have seen. Yours truly, Spring Brook. JOHN MASON.
Gentlemen:—I have been in the fence business for ten years, and I find no fence like the Peerless, both for galvanizing and workmanship. I consider it equal, if not superior to any other make of fence on the market today. I have always found the Banwell-Hoxie Fence Co. people of their word. Yours respectfully, Glenburnie, Ont. MACK, LILLIS.

RED ROSE TEA "is good tea"

Progressive Farmers Make Handsome Profits from Poultry

THE stoutest advocates of Poultry-Raising on the farm are the progressive farmers who have investigated the Peerless Way. These men are alive to the fact that Canada does not produce one third of the poultry and eggs consumed in this country, and that handsome profits go across the border to the American farmer who is called upon to supply the shortage.

You, Mr. Farmer, can have this profit, plus the amount spent in Customs duties and long freight hauls importing eggs and poultry from the States, and you will always have an eager market waiting to buy up all the poultry and eggs you can raise.

Read what this British Columbia farmer says:

Greenwood, B.C., Dec. 1, 1913.

"I am pleased to report a good season for the past summer with the poultry . . pullets are just commencing to lay. Eggs hatched well and I raised practically all in the Brooder and only lost (1) chick out of 500 hatched. I sold 20 dozen baby chicks and am keeping over 150 pullets, as it is the egg trade that I am working up.

"Since last September, eggs have been selling here at 70c. per doz., and at present they are bringing 80c. and are very scarce too."

(Sgd.) A. R. Royce.

The Peerless Way Makes Poultry Pay

The whole idea of the Peerless Way of Poultry Raising is to raise the greatest number of the strongest chickens at the least outlay of money and with the least expenditure of time. We know that a farmer's regular duties do not leave him much time to look after chickens, so we have bent all our energies to perfecting a system whereby a farmer can take care of 400 or 500 chickens the Peerless Way in less time than he can look after 30 or 40 the old way.

bread and milk twice a day and a moist mixture of equal parts bran and middlings twice a day. I also put some dry beef scraps where they can have ready access to it. When they are from three weeks to a month old I feed only morning and night.

Laying ducks I feed one-half bran, one-fourth middlings and one-fourth peanut hearts with the same amount of dried beef scraps twice a day, and I have never found a time when I thought they were not laying as many eggs as they should.

Raising the Goslings.

Goslings, while young and before their backs are feathered, must be kept from running through wet grass or standing out in a rain storm. It pays to be particular in this respect, as they die off alarmingly if allowed to get wet and cold.

Overfeeding is a mistake that many make and one which nearly always proves fatal to the goslin. Dry bread soaked in water is best for the first few days while they are learning to jerk off grass blades. They should have a small amount of corn meal wet up stiff each morning, a large teaspoonful to a gosling is enough, and all the drinking water they want to run to, besides an abundance of short grass. Short pasture or door yard grass is their best feed. They cannot eat the tall wire grass.

Goslings should be allowed a free range from the first, and if there is no running water for them to go into while young it will be better for them, as the water chills them and stunts growth and the turtles draw the helpless young ones under.

Feeding heavily on soft corn when the goslings are well grown should be avoided, as it causes leg weakness an death in heavy birds. Full grown goslings will feed on corn fodder as well as cattle and thrive on it. During the heat of the day goslings do not eat much and should have plenty of drinking water placed in a shady corner where they are in the habit of resting.

Large hens make the best mothers, and four eggs are usually enough for one sitting. Geese are apt to step on the goslings and break their backs and for that reason the old ones should not run with the goslings.

Fuss and Feathers.

The Hamburgs were bred extensively years ago and were known as most excellent layers. They lay a small white egg, but produce them in great numbers.

Range-raised poultry, other things, being equal, are more vigorous and sturdy than stock raised in confinement. With a portable house the chicks may be given the run of the cornfield or the orchard and two crops raised on the same ground.

It is very desirable during the breeding period to allow chicks to get outdoors on the ground as often as possible, provided the ground is free from snow or water, as they will ho much better and will be much hardier and more vigorous than if confined. As soon as they can get along without artificial heat, without any crowding, it should be removed.

It is gratifying to learn, on such good authority as Judge J. H. Drevenstedt, that the Light Brahma is once more coming back into popular favor. It was once considered the best of all breeds for the production of eggs and roasters, but its utility qualities were sacrificed to fancy points and with them went loss of vigor, stamina, shape and size. Some breeders kept to the old type and their faith is likely to be well rewarded.

130-Egg Incubator and Brooder Both For $13.90

FREIGHT AND DUTY PAID

If ordered together we send both machines for only $13.90 and we pay all freight and duty charges to any R. R. station in Canada. We have branch warehouses in Winnipeg, Man. and Toronto, Ont. Orders shipped from nearest warehouse to your R. R. station. Hot water, double walls, dead-air space between, double glass doors, copper tanks and boilers, self-regulating. Nursery under egg tray. Especially adapted to Canadian climate. Incubator and Brooder shipped complete with thermometers, lamps, egg testers—ready to use when you get them. Five year guarantee—30 days trial. Incubators finished in natural colors showing the high grade California Redwood lumber used—not painted to cover inferior material. If you will compare our machines with others, we feel sure of your order. Don't buy until you do this—you'll save money—it pays to investigate before you buy. Remember our price of $13.90 is for **both** Incubator and Brooder and covers freight and duty charges. Send for FREE catalog today, or send in your order and save time.

Write us today. Don't delay. **WISCONSIN INCUBATOR CO., Box 326, Racine, Wis., U. S. A.**

David Copperfield.

By Charles Dickens.

(Continued from last issue.)

"Annie, my dear," returned her mother, "once for all, I must really beg that you will not interfere with me, unless it is to confirm what I say. You know as well as I do, that your cousin Maldon would be dragged at the heels of any number of wild horses—why should I confine myself to four! I won't confine myself to four—eight, sixteen, two-and-thirty, rather than to say anything calculated to overturn the Doctor's plans."

"Wickfield's plans," said the Doctor, stroking his face, and looking penitently at his adviser. "That is to say, our joint plans for him. I said myself, abroad or at home."

"And I said," added Mr. Wickfield gravely, "abroad, I was the means of sending him abroad. It's my responsibility."

"Oh! Responsibility!" said the Old Soldier. " Everything was done for the best, my dear Mr. Wickfield; everything was done for the kindest and best, we know. But if the dear fellow can't live there, he can't live there. And if he can't live there, he'll die there, sooner than he'll overturn the doctor's plans."

"Well, well, ma'am," said the Doctor cheerfully, "I am not bigoted to my plans, and I can overturn them myself. I can substitute some other plans. If Mr. Jack Maldon comes home on account of ill health, he must not be allowed to go back, and we must endeavour to make some more suitable and fortunate provision for him in this country."

Mrs. Markleham was so overcome by this generous speech (which, I need not say, she had not at all expected or led up to) that she could only tell the Doctor it was like himself, and go several times through that operation of kissing the sticks of her fan, and then tapping his hand with it. After which she gently chid her daughter Annie, for not being more demonstrative when such kindnesses were showered, for her sake, on her old playfellow; and entertained us with some particulars concerning other deserving members of her family, whom it was desirable to set on their deserving legs.

All this time her daughter Annie never once spoke, or lifted up her eyes. All this time Mr. Wickfield had his glance upon her as she sat by his own daughter's side. It appeared to me that he never thought of being observed by any one; but he was so intent upon her, and upon own thoughts in connection with her, as to be quite absorbed. He now asked what Mr. Jack Maldon had actually written in reference to himself, and to whom he had written it?

"Why here," said Mrs. Markleham, taking a letter from the chimney-piece above the Doctor's head, "the dear fellow says to the Doctor himself—where is it? Oh!—'I am sorry to inform you that my healtn is suffering severely, and that I fear I may be reduced to the necessity of returning home for a time, as the only hope of restoration. That's pretty plain, poor fellow! His only hope of restoration! But Annie's letter is plainer still. Annie, show me that letter again."

"Not now, mamma," she pleaded in a low tone.

My dear, you absolutely are, on some subjects, one of the most ridiculous persons in the world," returned her mother, "and perhaps the most unnatural to the claims of your own family. We never should have heard of the letter at all, I believe, unless I had asked for it myself. Do you call that confidence, my love, towards Doctor Strong? I am surprised. You ought to know better."

The letter was reluctantly produced; and as I handed it to the old lady, I saw how the unwilling hand from which I took it trembled.

"Now let us see," said Mrs. Markleham, putting her glass to her eye, "where the passage is. 'The remembrance of old times, my dearest Annie'—and so forth—it's not there. 'The amiable old Proctor'—who's he? Dear me, Annie, how illegibly your cousin Maldon writes, and how stupid I am? 'Doctor,' of course. Ah! amiable indeed!" Here she left off, to kiss her fan again, and shake it at the Doctor, who was looking at us in a state of placid satisfaction. "Now I have found it. 'You may be surprised to hear, Annie,'—no, to be sure, knowing that he never was really strong; what did I say just now?—'that I have undergone so much in this distant place, as to have decided to leave it at all hazards; on sick leave. if I can; on total resignation, if that is not to be obtained. What I have endured, and do endure here, is insupportable.' And but for the promptitude of the best of creatures," said Mrs. Markleham, telegraphing the Doctor as before, and refolding the letter, "it would be insupportable to me to think of."

Mr. Wickfield said not one word, though the old lady looked to him as if for his commentary on this intelligence; but sat severely silent, with his eyes fixed on the ground. Long after the subject was dismissed, and other topics occupied us, he remained so; seldom raising his eyes; unless to rest them for a moment, with a thoughtful frown, upon the Doctor, or his wife, or hoth.

The Doctor was very fond of music. Agnes sung with great sweetness and expression, and so did Mrs. Strong. They sang together, and played duets together, and we had quite a little concert. But I remarked two things; first, that though Annie soon recovered her composure, and was quite herself. there was a blank between her and Mr. Wickfield which separated them wholly from each other; secondly, that Mr. Wickfield seemed to dislike the intimacy of her and Agnes, and to watch it with uneasiness. And now, I must confess, the recollection of what I had seen on that night when Mr. Maldon went away, first began to return upon me with a meaning it had never had, and to trouble me. The innocent beauty of her face was not as innocent to me as it had been; I mistrusted the natural grace and charm of her manner; and when I looked at Agnes by her side, and thought how good and true Agnes was, suspicions arose within me that it was an ill-assorted friendship.

She was so happy in it herself, and the other was so happy too, that they made the evening fly away as if it were but an hour. It closed in an incident which I well remember. They were taking leave of each other, and Agnes wat going to embrace her and kiss her, wnen Mr. Wickfield stepped between them, as if by accident, and drew Agnes quickly away. Then I saw, as though all the intervening time had been cancelled, and I were still standing in the doorway on the night of the departure, the expression of that night in the face of Mrs. Strong, as it confronted his.

I cannot say what an impression this made upon me, or how impossible I found it, when I thought of her afterwards, to separate her from this look, and remember her face in its innocent lovliness again. It haunted me when I got home. I seem to have left the Doctor's roof with a dark cloud lowering on it. The reverence I had for his grey head was mingled with commiseration for his faith in those who were treacherous to him, and with resentment against those who injured him. The impending shadow of a great affliction, and a great disgrace that had no distinct form in it yet, fell like a stain upon the quiet place where I had worked and played as a boy, and did it a cruel wrong. I had no pleasure in thinking, any more, of the grave old broad-leaved aloe trees which remained shut up in themselves a hundred years together, and of the trim smooth grass-plot, and the stone urns, and the Doctor's walk and the congenial sound of the Cathedral bell hovering above them all. It was as if the tranquil sanctuary of my boyhood had been sacked before my face, and its peace and honour given to the winds.

But morning brought with it my parting from the old house, which Agnes had filled with her influence; and that occupied my mind sufficiently. I should be there again soon, no doubt; I might sleep again—perhaps often—in my old room; but the days of my inhabiting there were gone, and the old time was past. I was heavier at heart when I packed up such of my books and clothes as still remained there to be sent to Dover, then I cared to show Uriah Heep, who was so officious to help me, that I uncharitably thought him mighty glad that I was going.

I got away from Agnes and her father, somehow, with an indifferent show of being very manly and took my seat upon the box of the London coach. I was so softened and forgiving going through the town, that I had half a mind to nod to my old enemy the butcher, and throw him five shillings to drink. But he looked such a very obdurate butcher as he stood scraping the great block in the shop, and moreover, his appearance was so little improved by the loss of a front tooth which I had knocked out, that I thought it hest to make no advances.

The main object on my mind, I remember, when we got fairly on the road was to appear as old as possible to the coachman, and to speak extremely gruff. The latter point I achieved at great personal inconvenience: but I stuck to it, because I felt it was a grown-up sort of thing.

"You are going through, sir?" said the coachman.

"Yes, William," I said, condescendingly (I knew him); "I am going to London. I shall go down into Suffolk afterwards."

"Shooting sir?" said the coachman.

He knew as well as I did that it was just as likely, at that time of year, I was going down there whaling; but I felt complimented, too.

"I don't know," I said, pretending be be undecided, "whether I shall take shot or not."

"Birds is got very shy, I'm told," said William.

"So I understand," said I.

"Is Suffolk your county, sir?" asked William.

"Yes," I said, with some importance. "Suffolk's my county."

"I'm told the dumplings is uncommon fine down there," said William.

I was not aware of it myself, but I felt it necessary to uphold the institutions of my county, and to evince a familiarity with them; so I shook my head, as much as to say "I believe you!"

"And the Punches," said William. "There's cattle! A Suffolk Punch, when he's a good un, is worth his weight in gold. Did you ever breed any Suffolk Punches yourself, sir?"

Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

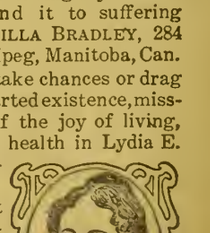
DOCTORS DID NOT HELP HER

But Lydia E. Pinkham's Vegetable Compound Restored Mrs. Bradley's Health—Her Own Statement.

Winnipeg, Canada. — "Eleven years ago I went to the Victoria Hospital, Montreal, suffering with a growth. The doctors said it was a tumor and could not be removed as it would cause instant death. They found that my organs were affected, and said I could not live more than six months in the condition I was in.

"After I came home I saw your advertisement in the paper, and commenced taking Lydia E. Pinkham's Vegetable Compound. I took it constantly for two years, and still take it at times, and both my husband and myself claim that it was the means of saving my life. I highly recommend it to suffering women."—Mrs. ORILLA BRADLEY, 284 Johnson Ave., Winnipeg, Manitoba, Can.

Why will women take chances or drag out a sickly, half-hearted existence, missing three-fourths of the joy of living, when they can find health in Lydia E. Pinkham's Vegetable Compound?



For thirty years it has been the standard remedy for female ills, and has restored the health of thousands of women who have been troubled with such ailments as displacements, inflammation, ulceration, tumors, irregularities, etc.

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman, and held in strict confidence.

CHALLENGE COLLARS

"FOR THE MAN WHO WORKS"

Hard work is no excuse for an untidy appearance. A Challenge Waterproof Collar with its dull linen-like finish will keep you neat and well-dressed. Sold at all Gents' Furnishing and Dry Goods Shops, or send 25c. for sample collar.

THE ST. JOHN Business COLLEGE

S. KERR Principal

"E—no," I said, "not exactly."

"Here's a gep'lm'n behind me, I'll pound it," said William, "as has bred 'em by wholesale."

The gentleman spoken of was a gentleman with a very unpromising squint, and a prominent chin, who had a tall white hat on with a narrow flat brim, and whose close-fitting drab trousers seemed to button all the way up outside his legs from his boots to his hips. His chin was cocked over the coachman's shoulder, so near to me, that his breath quite tickled the back of my head; and as I looked round at him, he leered at the leaders with the eye with which he didn't squint, in a very knowing manner.

"Ain't you?" asked William.

"Ain't I what?" said the gentleman behind.

"Bred them Suffolk Punches by the wholesale?"

"I should think so," said the gentleman. "There ain't no sort of orse that I ain't bred, and no sort of dorg. Orses and dorgs is some men's fancy. They're wittles and drink to me—lodging, wife, and children—reading, writing and 'rithmetic—snuff, tobacker and sleep."

"That ain't a sort of man to see sitting behind a coach-box, is it though?" said William in my ear, as he handled the reins.

I construed this remark into an indication of a wish that he should have my place, so I blushingly offered to resign it.

"Well, if you don't mind it, sir," said William, "I think it would be more correct."

I have always considered this as the first fall I had in life. When I booked my place at the coach-office, I had had "Box Seat" written against the entry, and had given the book-keeper half a crown. I was got up in a special great coat and shawl, especially to do honour to that distinguished eminence; had glorified myself upon it a good deal; and had felt that I was a credit to the coach. And here, in the very first stage I was supplanted by a shabby man with a squint, who had no other merit than smelling like a livery stable, and being able to walk across me, more like a fly than a human being, while the horses were at a canter!

A distrust of myself, which has often beset me in life on small occasions, when it would have been better away, was assuredly not stopped in its growth by this little incident outside the Canterbury coach. It was in vain to take refuge in gruffness of speech. I spoke from the pit of my stomach for the rest of the journey, but I felt completely extinguished, and dreadfully young.

It was curious and interesting, nevertheless, to be sitting up there, behind four horses: well educated, well dressed, and with plenty of money in my pocket; and to look out for the places where I had slept on my weary journey. I had abundant occupation for my thoughts, in every conspicious landmark on the road. When I looked down at the tramps whom we passed, and saw that well-remembered style of face turned up, I felt as if the tinker's blackened hand were in the bosom of my shirt again. When we clattered through the narrow street of Chatham, and I caught a glimpse, in passing, of the lane where the old monster lived who had bought my jacket, I stretched my neck eagerly to look for the place where I had sat, in the sun and in the shade, waiting for my money. When we came, at last, within a stage of London, and passed the veritable Salem House where Mr. Creakle had laid about him with a heavy hand, I would have given all I had, for lawful

WOMEN CURED AT HOME

Women's disorders always yield from the very beginning of the treatment to the mild, but effective, action of Orange Lily. Within two or three days after commencing its use the improvement becomes noticeable, and this improvement continues until the patient is completely cured. Orange Lily is an applied or local treatment, and acts directly on the womanly organs, removing the congestion, toning and strengthening the nerves, and restoring perfect circulation in the diseased parts. In order to convince all suffering women of the value of this remedy, I will send a 35-cent box, enough for ten days' treatment, absolutely FREE to each lady sending me her address. MRS. FRANCES E. CURRAH, Windsor, Ont.

Learn Music In Sixty Minutes

Not 6 Years, 6 Months or 6 Days, But 60 Minutes.

We mean just what we say and we can point to men, women and children of all ages and classes, in almost every nook and cranny of this Continent, who have learned to play the piano or organ in ONE HOUR. An invention, so simple as to astonish every one, makes this startling statement absolutely true.

We send the entire invention absolutely free. It will enable you to read and play at once—within one hour any one of the 100 pieces of music we send you which music is among the world's best pieces written by famous composers. No charge of any kind. No come backs or tricks.

"Just Think! I Never Touched a Piano Before."

You receive the entire method and 100 pieces of music, free, if you just write us thus: "Send me Easy Form Music Method for 7 days' free trial as announced in the Maritime Farmer. No cash. No C.O.D. All you do is to write as we say. Then when proof is before you and you can play the piano or organ and you know you can play and you are satisfied—then send us $1.50 and after that $5.00 in small monthly payments. **Positively this is all you have to do.** Our testimonial proof probably bears the name of some one you may know. Don't wait. Here's a chance to test free this great invention. You know business men well enough to realize that unless we pleased and satisfied customers, we could not afford to pay express charges and other expenses, unless we were certain of this great invention. State number of white keys on your piano or organ, also post office. Easy Method Music Co., 372 Wilson Bldg., Toronto, Ont., Canada.

permission to get down and thrash him, and let all the boys out like so many caged sparrows.

We went to the Golden Cross, at Charing Cross, then a mouldy sort of establishment in a close neighborhood. A waiter showed me into the coffee-room; and a chamber-maid introduced me to my bedchamber, which smelt like a hackney-coach, and was shut up like a family vault. I was still painfully conscious of my youth, foz nobody stood in any awe of me at all; the chambermaid being utterly indifferent to my opinions on any subject, and the waiter being familiar with me, and offering advice to my inexperience.

"Well now," said the waiter, in a tone of confidence, "what would you like for dinner? Young gentlemen like poultry in general; have a fowl!"

I told him, as majestically as I could, that I wasn't in the humor for a fowl.

"Ain't you?" said the waiter. Young gentlemen is generally tired of beef and mutton; have a weal cutlet"

I assented to this proposal, in default of being able to suggest anything else.

"Do you care for taters?" said the waiter, with an insinuating smile, and his head on one side. "Young gentlemen generally has been overdosed with taters."

I commanded him in my deepest voice, to order a veal cutlet and potatoes, and all things fitting; and to inquire at the bar if there were any letters for Trotwood Copperfield, Esquire—which I knew there were not, and couldn't be, but thought it manly to appear to expect.

He soon came back to say there were none at which I was much surprised), and began to lay the cloth for my dinner in a box by the fire. While he was so engaged, he asked me what I would take with it; and on my replying "Half a pint of sherry", thought it a favorable opportunity I am afraid, to extract that measure of wine from the stale leavings at the bottom of several small decanters. I am of this opinion, because, while I was reading the newspaper, I observed him behind a low wooden partition, which was his private apartment, very busy pouring out of a number of those vessels into one, like a chemist and druggist making up a prescription. When the wine came, too, I thought it flat; and it certainly had more English crumbs in it, than were to be expected in a foreign wine in anything like a pure state; but I was bashful enough to drink it and say nothing.

Being then, in a pleasant frame of mind (from which I infer that poisioning is not always disagreeable in some stage of the process), I resolved to go to the play. It was Covent Garden Theatre that I chose; and there, from the back of a centre box, I saw Julius Caesar and the New Pantomine. To have all those noble Romans alive before me, and walking in and out for my entertainment, instead of being the stern taskmasters they had been at school, was a most novel and delightful effect. But the mingled reality and mystery of the whole show, the influence upon me of the poetry, the lights, the music, the company, the smooth stupendous changes of glittering and brilliant scenery, were so dazzling, and opened up such illimitable regions of delight, that when I came out into the rainy street, at twelve o'clock at night, I felt as if I had come from the clouds where I had been leading a romantic life for ages, to a bawling, splashing link-lighted, umbrella struggling, hackney coach jostling, patten clicking, muddy, miserable world.

I had emerged by another door, and stood in the street for a little while, as if I really were a stranger upon earth; but the unceremonious pushing and hustling that I received, soon recalled me to myself, and put me in the road back to the hotel; whither I went, revolving the glorious vision all the way; and where after some porter and oysters, I sat revolving it still, at past one o'clock, with my eyes on the coffee-room fire.

(To be continued)

For Home and Country.

THE POSSIBILITIES OF A WOMAN'S CLUB.

In the love of home, the love of country has its rise. The socialization of the rural community is the dominant question in the minds of thinking men and women in Canada from coast to coast. In a recent study of "life in the country and small towns," one of the striking conditions brought out was the lack of organized social life. The complaint came, not from casual visitors to the country, but was the direct testimony of men and women living on the farm or in the town.

The value of co-operation has not yet been realized as thoroughly in our social life as in the business world. In the social field, particularly in the country and small communities, co-operation is indispensable. In the face of existing obstacles in rural districts, the individual can achieve but little. The need of mutual help is greatest, perhaps, among the women of the community. The temptation to form the "stay at home attitude" is great, especially to women who have the care of large families and live in isolated homes. They are apt to lose the desire to mingle with whatever life they may be in the community, and fall slaves to a deading routine from which it becomes more and more difficult to break away. Here lies the secret of so many cases of insanity on prairie farms. To create a bond of friendly intercourse between such women and a common meeting ground, where they may come together and spend an afternoon with pleasure and profit, is surely worth while. There they may read the same books and find expression to their tongues. This is the true mission of the properly organized Women's Club, and its effect has proven to be the rousing of latent ability, the reviving of a literary appetite and the broadening of the mind along various avenues.

FORMING A CLUB.

The best method of starting a club is to gather a few friends together, who may be interested, and talk the matter over informally. It is best to decide in a general way what the work of the club shall be who are to be invited to become charter members the frequency and hour of meetings, and any other business which may effect the particular environment. Try and confine the membership to a congenial group during the first season. The work of the season will naturally run along broad educational lines and it is necessary at the beginning to work as a unit in order that the women behind the movement may gain their bearings. Many clubs have been wrecked at the very start by including a variety of elements which would not mix in any other line of life and certainly could not be expected to do otherwise on a social basis such as is necessary in the matter at hand.

The next step is to send out a definite call for the first meeting. In a small informal club, officers may be elected at the first meeting and the constitution and by-laws, if any, be adopted. President, Secretary and Treasurer will be found sufficient. As the activities increase, other officers may be selected. It is a mistake to overload the club with officers. Another mistake often made is to overload the program with a multiplicity of subject to be studied. The more simple the list of officers and the possibility of overtaking the programme for the year, the more likely that the club will flourish and survive. A small programme committee is of the greatest assistance to any club. It is the duty of such a committee to discover the resources of the membership, to find out those who can sing, or write or read and make opportunities to meet these various talents.

In deciding what the club will study it is well to select a subject within the grasp of all. Select such a course that material for papers and discussion may be easily obtained and the preparation not beyond the time of the busy mother.

"NEEDLE AND BOOK" CLUB.

One very simple club was formed by a group of women who pacified their troubled conscience for giving themselves "an afternoon off" each week, by taking their sewing with them. Ideas for Christmas gifts were exchanged. They organized a "Needle and Book" Club in which the members took turns in reading aloud from a chosen book. Last winter they made themselves familiar with some of our own writers, such as Gilbert Parker, Norman Duncan, Marion Keith and Ralph Connor. At the conclusion of the season one of the members confessed that she had had no idea that there was such a wealth of Canadians of real merit and accomplishment.

CHILD STUDY.

A vital problem of today is Child Study. No more needful study for a Woman's Club. The relation of the home and the school and the community is a real problem in our modern life. Child study is one of the subjects on which it would be interesting to have the club invite an outside speaker. Where there is no outside speaker available the following subjects may be suggestive for papers to be written by various members: "The Care of Children in Health," "The Rights of Children"; "The Benefit of the Public Library to the Children"; "What Books do Our Children Read." Miss Lillian Smith chief of the story telling staff of the Toronto Public Library, was asked recently which books she thought of the most value for children. She named among others, Marshall's charming story of Canada and "Our Empire Story" by the same author; Guerbers stories of Greece and Rome, the "Red Story Book" and the 'Blue Story Book", both by Lang; "Old English Stories" by Eva Tappin; "Story Telling" by Edna Lyman, as well as the other book by the same author, "What to Tell and How to Tell it." This last book includes some beautiful Japanese and Spring stories.

Then there are the problems connected with Child Study. In a small community of about sixteen families, with an attendance at the school of about twenty-seven, the women organized and with some assistance from the men, improved the school surroundings. They had old stumps and scraggy trees removed and fresh young trees planted. They had new windows placed in the building, and new steps were built to replace the worn and unstable ones. A flag-pole was erected and a new flag purchased The desks were thoroughly cleaned and the floors stained. Provision was made for the wraps of the children of a better character than the old

pegs. An organ was bought and the families contributed to a library. A few pictures were secured—pictures which bespoke of nation building and which would appeal to the heroic imagination of the child. During the winter entertainments were given in the school. In short the school became a social centre around and about which the parents and children rallied to their mutual benefit.

LIBRARIES ORGANIZED

In a number of instances Women's Clubs have been the means of organizing local libraries. The members of the club, by means of entertainments. Small reference libraries were first bought for the use of the members. Gradually other books were secured and great care taken to select books of known worth and broadening qualities, in the best sense of the term. The members of the club take turn in acting as librarian, and so become intimately acquainted with the books and their message.

TRAVEL TALKS.

In many newly settled sections of the great North West, a large percentage of the settlers are recent arrivals from various foreign countries. A series of Travel Talks is a most facinating method of education. It is probable that many sections of Canada will have representatives in the average Women's Club. If each member will tell the story of the country, district or country of her childhood there will be an immense amount of local history released and a fund of story and history which which will prove of a highly educational nature. Along the same line there are possibilities pf papers of a strictly historical value. It would be of great interest to study the countries which have representatives in the community. For instance there are no doubt many Italians. From Italy we have a host of the world's greatest artists such as Raphael, Michael Angelo, Gailileo, Dante, Garibaldi and the Cabots. These would furnish material for many months of study. England, Germany, France not to speak of Ireland and bonnie Scotland there is unlimited wealth of song and story.

VALUE OF PICTURES.

In studying any country or reading any book, pictures are of inestimable value. Literary clubs may find pictures illustrating the scenes in which the stories are laid, and patriotic clubs may secure copies of historic pictures and places. It is a good idea too in clubs of this nature to circulate the pictures among the members. If they are mounted on cardboard they are easily handled and the pictures become familiar and the incidents fastened on the mind.

Pictures may be procured from G. B. Brown and Co., 38 Lovett Street, Beverley, Mass., at one cent each or one hundred and twenty for one dollar. The Perry pictures are sold by the Perry Picture Company, Malden, Mass. Reproductions from famous pictures and Indian portraits are sold by A. W. Mumford and Co., 378 Michigan Avenue, Chicago, Ill. Some Travel Clubs use picture postal cards with splendid results. After a vacation almost any member will have a collection of cards from which a splendid talk may be given.

HISTORICAL CLUBS.

A woman's historical club, as organized in many communities, has proven of lasting value to the entire district. Here the field is varied. In older portions of the country around such districts as Quebec, Ottawa, Kingston, Fort Garry, the Niagara peninsula, there are stories stored away in old attics in papers and old prints, which would astonish the modern historian and throw light on many an incident in the early history of our country. Around Brantford there cluster stories of the Indians. Relics are even yet turned up by the plow. At Niagara, the women formed a historical club some years ago and today the exhibition is of national interest and importance. The battlefields have been studied and points of interest marked by lasting but inexpensive monuments. Miss Winterbottom, as the organizer of this club, has contributed a wealth of information to the early history of her birth place.

Public meetings are part of the programme of the progressive Historical Club. The historical periods are marked by the singing of the old songs and reading of poems written during the period or relating to it. Any Canadian who has had the pleasure of listening to Katherine Hale give her talk on "Music in Canadian Literature" will realize what a full storehouse from which we draw.

In almost every community there are a few men and women, who have shared in the history making period, and could tell of the clearing of the forest and the period of settlement. The event of the first train, is also a point of interest in the lives of these older people. If possible invite them to the meeting and make them the guest to be honored. First hand information will be of the greatest interest and helpfulness as well as entertaining to a degree.

Special open meetings should be held on the National holidays, to which the whole community should be invited. The younger people will readily enter the spirit of the day by giving historical tableaux. An illustrated talk on the flag is alway popular and nothing tends to make the interest real than the reverting to the blending af the three mighty crosses to make the Union Jack.

REFRESHMENTS.

Many clubs serve refreshments at the close of their sessions and when the members come from a distance and have a long drive home, this plan is excellent. Even neighbors find the cup of tea a splendid way to stimulate friendship. The mind has been stimulated by the papers and discussion of the meeting and the tea-cup talk is vastly different from what is usually associated with afternoon tea

In conclusion let me quote from an article which appeared in Colliers by Dore Lyon:—"The Woman's Club is hardly understood by the mass of men and women who stand on the outside and condemn, but make no special effort towards their own enlightenment on the subject. It is simply having one's pleasure, duty, philanthropic work—as the case may be—organized."

In their club life, women exchange ideas on the important topics of the day. They give to each other the result of their study of subjects of general information. They exercise long forgotten lines of imaginative composition, by writing papers and essays. They cultivate feelings of cordiality and good fellowship towards their own sex. They bring into their lives uplifting influences.

Women likewise receive a training in their club life which is invaluable to their homes. They learn the art of self control and a dignified consideration of important questions. A woman with a well poised and rounded mind, certainly makes a better house keeper and home-maker.—Marion Dallas, Greenville Jct., Maine.

ONTARIO WHEAT + MANITOBA No 1 HARD
BEAVER FLOUR
YOU can make a bigger and better loaf of bread with "Beaver" Flour than with any Western Wheat Flour.
Of course, there's no comparison between Ontario fall wheat and western wheat. Bread made of Ontario flour alone is immeasureably superior to that made of western wheat in texture, fineness, whiteness and flavor.
It is true that western wheat flour makes a big loaf—but it is heavy, tough, full of holes and uninviting both in appearance and flavor. "Beaver" Flour has the delicacy of flavor—the fineness of texture—the snowy whiteness of the best Ontario fall wheat, with the strength of Manitoba wheat flour.
Because "Beaver" Flour contains both Ontario fall wheat with a little Manitoba spring wheat to increase the strength.
"Beaver" is the original blended flour —a product of science and patience— perfected after years of testing.
If you want real home-made bread with the real home-made flavor—if you want light, delicious Pastry, Cakes and Pies— use "Beaver" Flour, best for one, best for all.

Home Nursing.

Perhaps a few hints about home nursing might interest your readers. It is unfortunately scarcely possible to keep all members of the family well, even in healthy country districts, therefore, the following notes may be of use. In the first place, it is easier to keep well than to get well, and by cultivating good and regular habits we may keep the machinery of the body in order and the daily functions performed. Early to bed and early to rise—adults require from six to eight hours sleep, according to age and strenuous labour, children much longer. Have your food regularly, take sufficient wholesome diet, and do not eat between meals. Alcohol should be avoided, unless ordered by the doctor. Tea and coffee should be taken moderately, and never with meat. It is wise for people with weak digestions to avoid drinking anything with their food, but sufficient liquid should be taken between meals. Young children should never have tea. Teeth are of great importance, as thorough mastication is impossible if these are decayed. It is penny wise and pound foolish to postpone a visit to the dentist. By having the first sign of decay attended to the whole set of teeth will be spared. False teeth are never so comfortable and useful as those provided by nature. The teeth should be brushed twice daily—morning and before going to bed. Remove false teeth at night. Avoid eating too many sweets, and never crack nuts with the teeth, as the enamel covering of the tooth will also crack and chip off, thus causing an open germ trap.

The skin and hair require attention. Clothing should be light and warm, a woollen garment worn next the body. The bowels should act once a day; keeping to a regular hour is a wise plan, preferably after breakfast. Have your rooms thoroughly aired, and always sleep with the bedroom windows open.

Always change wet stockings and boots, or any other wet garment. Never keep on damp clothes and think you can dry them by sitting or standing before the fire. It is a most dangerous practice, and nine times out of ten the foundation of severe chest troubles. It matters little how wet one gets when walking briskly, provided that one changes before sitting still. If the above rules are attended to I can safely say you will have a better chance of keeping well and battling with our varied climate.

In caring for the sick, the first thing to think of is the time the illness will last, and to choose a suitable room if there are a few rooms at one's disposal. It should be large, well ventilated, have a good fireplace with faultless chimney, on south side of the house if possible, and well away from noisy kitchen or children's quarters. Provided the drains are in perfect order a lavatory close by is a great gain. The floor should be covered with some washable material, and mats take the place of carpet, because these can be easily taken away for shaking. Just the necessary amount of furniture to use and to look comfortable, cheery pictures, and not too many (if the illness is a long one an occasional change of pictures would be appreciated by the invalid), also a change of cushion and chair covers. All this helps to break the monotony which is bound to be felt when living night and day in the same room. A single bedstead and hair mattress is the most comfortable, healthy, and the easiest for nursing purposes; it should be free both sides and in a position so that the invalid does not face the fight; also free from draughts. The bed clothes should be light and warm. For an ordinary illness flannels are not wholly needed there should be an under blanket and sheet and on the top of this should be placed mackintosh sheet; these stretch from shoulders to knees. A

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience**, we know better than any doctor; and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment. If you suffer from **pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid**, to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured**, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—**young or old.** To **Mothers of Daughters**, I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask** for the **free treatment to-day**, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309, WINDSOR, ONTARIO

SEED OATS

Some Brokers selling Western Oats are sending out circulars intended to fool the farmers and claiming their seed oats as good as ours. Last year we had *no* successful competitors and nearly every one of our patrons are ordering again this year.

We just shipped out 6,000 Bushels to a Quebec city firm. The Dominion Government Inspector who examined those oats writes us that they are *even better than last years supply.*

In 1913 we shipped an agricultural Society in Rimouiski 12,000 Bushels which yielded by the Sec'y's Report *"The Best Crop we have ever seen."*

If your Dealers have not secured Read's Island Graded Seed order early from ourselves. Ordinary, true to name, Banner Club or Registered *Seed.* The extra yield twice over pays for this article.

JOSEPH READ & CO., LTD.
Summerside, - - P. E. I.

drawsheet can be made from an ordinary sheet folded lengthwise, tucked firmly in either side. This length allows the patient to have a cool place to lie upon and can easily be pulled through to get rid of crumbs and creases. A sheet large enough to turn well over the blankets at the top, two blankets, a thin bedspread, and an eider down, if the weather is cold, is sufficient covering for the top. Pillows according to requirements.—Nurse.

Pancakes.

To make extra good pancakes allow four eggs to every ½ lb. of flour used, and the flour should be of the finest quality. For plain pancakes, allow four eggs to every 1 lb. of flour, and very economical pancakes may be made without eggs. Pancakes cannot be made too thin, nor can they be cooked too quickly. If the fire be good—but not fierce— and clear, and the pan be kept quite hot, and only enough batter put in to cover the bottam, less than a minute will cook each pancake, and in this way a great pile may be cooked in a short time. It is better that one person should cook the batter while another rolls up the pancakes. Sugar should not be mixed with batter for pancakes, as it makes them heavy.

Plain Pancakes.—Put 1 lb. of flour in a basin, add gradually a full pint of milk, stirring all the time till the batter is smooth and free from lumps; ther give the batter a good beat up with an egg-whisk or a wooden spoon. Next beat up two eggs and add them to the batter, along with a saltspoonful of salt. Have a small frying or omelet pan scrupulously clean, and have a breakfast-cupful of butter (without salt, less the pancakes stick to the pan) or lard melted, and keep it hot by the side of the fire. Put the pan on the fire, and put a dessert spoonful of the melted fat into it, and put in enough batter to cover the bottom. In a moment the batter willset, slip a knife round the edges and turn the pancake over to cook the other side. Then turn it on to a clean, hot baking-tin, or a piece of paper may be used; dredge with sugar, roll up, and put on a hot dish at the front of the oven. When all are done, dredge the tops with sugar, and pile the rolls up neatly on a folded napkin, and serve with lemon. Pancakes must be served very hot.

Economical Pancakes.—Mix up flour salt, and milk as above, then beat in a dessertspoonful of egg-powder and a reaspoonful of baking-powder. Melt a cupful of lard, put some in pan, pour in batter, cook as in last recipe, dredge with pounded sugar, and serve with quarters of lemon.

Apple Sandwich.

Mix a half cupful of sugar and half a saltspoonful of cinnamon or the grated rind of half a lemon, taking care that none of the bitter white rind gets in; melt half a cupful of butter and stir into it one pint of soft breadcrumbs; prepare three pints of sliced apples; butter a pudding-dish; put in a laver of crumbs, then sliced apples sprinkled with sugar. Repeat lavers of crumbs, apples, and sugar until your material is used. If the apples are not juicy add half a cupful of cold water, and, if not tart enough, add the juice of half a lemon. Cover with a thick laver of crumbs, and, to prevent burning, protect with a tin for a few minutes until it begins to bake. An hour's baking will suffice. Serve with cream.

SPECIAL ADVICE FOR MEN
Strength Restored By New Method

The little book described below (which I gladly send free, sealed, by mail, to any young or elderly man anywhere) contains in its 85 beautifully illustrated pages everything a man need know with regard to certain strictly personal subjects, and as a guide through his entire life, from the delicate period of youth, when wholesome advice is most needed, on through early manhood to a ripe, vigorous, healthy old age. Over a million of these books have been thus distributed by me all over the world. Therefore, please use coupon below and get YOUR free copy by return mail. SANDEN CO., DISTRIBUTORS.

Do you know, my friend, that there is a wonderful new way to apply a certain, great, natural FORCE to your body, and by which you may, without effort, trouble or inconvenience, treat your own self in the privacy of your home for debility and lost vitality, without using a single drug or medicine? This great FORCE, as a restorer of vitality and as a means to overcome those weaknesses which result from indiscretion and unnatural practices, is to-day being used all over the civilized world, and I give it as my honest opinion, based upon a vast observation and study, that any man anywhere, who leads a decent, manly life and who applies this marvellous FORCE in a scientific and rational way, can, without employing a single drug, be restored again to a state of perfect, rugged health and vigor, without a remaining ache, pain or weakness.

MANLY MEN ARE THE WORLD'S POWER TO-DAY

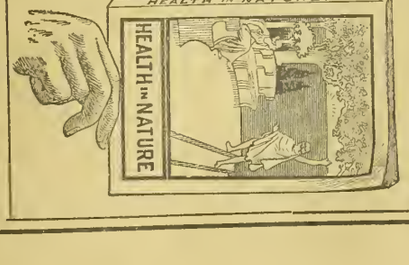
As we all know, these debiliating weaknesses handicap a man in every condition of life, while, on the other hand, a perfect speimen of vigorous, robust, lusty manhood is ever admired by both women and men alike, while, of course, it is certainly only such a man who can attain the really great success of life. Therefore, I say to you, no matter what your size, whether you are small or large, no matter what your occupation, no matter whether you are a college graduate or workng on the farm or in the factory, no matter whether you are young or elderly, it is all a question of your vigor and your vitality, and if I can give you a good, abundant supply of this same great power of VITAL FORCE, then it is easy to believe that I can completely restore your vigorous health, can overcome the evil of past indiscretions so you will be exactly the same in your influence over people, exactly the same in your manly bearing as other manly, strong-nerved, warm-blooded fellows of your acquaintance.

With an idea of attaining this all for you, I recommend you to investigate a simple little VITALIZING APPLIANCE of my invention, which I am now sending out in great numbers for use by men everywhere who need new manly strength. This little VITALIZER is very light, weighing only several ounces, and can be worn without any one suspecting that you are wearing it. You buckle it on your body upon going to bed and take it off mornings. Thus while you sleep it sends its wonderful power which I call VITALITY or VITAL FORCE, into your blood, nerves and organs. Users say it takes pain and weakness out of the back from one application, and further say 60 to 90 days' time is sufficient to restore a state of health, strength and vigor. I am not offering this VITALIZER here for sale, but want you first to send for my book, that you may learn all about the whole wonderful subject, and why I get such quantities of testimonials from users everywhere telling of results after drugs completely and utterly fail.

NOTE— With special attachments VITALIZER is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, nervousness and general ill health. Please write for book to-day, or, if near by, I should like you to call. Hours—9 to 6.

Use Coupon; Get Free Book

Remember, the little illustrated book which I send free, sealed, by mail, as per coupon below not only fully describes my VITALIZER, telling of a special offer by which you may get one on special terms for use in your own case, but contains a great fund of private advice for men, some good, wholesome cautions, and a lot of general information that might be of value to you to the end of your days. Therefore, please write or call.



DR. M. F. SANDEN CO.,
140 Yonge St., Toronto, Ont.

Dear Sirs:—Please forward me your book, as advertised, free, sealed.

For Farm Service

ANYTHING around the farm that is worth building, is worth protecting. Well-painted barns and out-buildings add a real money value to the whole farm, by giving it a prosperous appearance, and making everything look "Spic and Span".

Good paint is protection against wear and weather—it is life insurance against sun, rain, frost and snow—the same as a fire insurance policy secures you against fire. Good paint is the only kind you can afford to use. Poor paint is money wasted—extravagance—the best paint is always the cheapest in the long run.

FOR THE HOUSE—it pays to use MARTIN-SENOUR "100% PURE" PAINT. It takes less and wears longer, and gives lasting beauty and satisfaction.

FOR THE BARN and out-buildings, use the Red that stays Red — MARTIN SENOUR "RED SCHOOL-HOUSE PAINT". (Trim with White and the results will be both cheerful and pleasing).

FOR WAGONS, *IMPLEMENTS AND TOOLS.*—The most satisfactory paint to use is "MARTIN-SENOUR WAGON PAINT". It makes things look like new, and lengthens the life of their usefulness.

Write for "Farmer's Color Set", showing the various paints for farm service—and the name of our nearest Dealer-agent. 35

Hauling competition, single—1, Jas Goold; 2. Fred S. Black; 3, C. W. Pugsley.

Halifax Market Prices.

Since our last writing there has been a number of changes in the market quotations at Halifax. The most noticeable feature has been the rapid decline in eggs to 22c. per dozen, this is a urop of eight cents during the past two weeks. Receipts of butter continue to be heavy, but the demand for creamery prints has been very good and the quotation of 30c has held, dairy prints, however have had a drop of four cents to 24c per lb. Cheese is very scarce and any offerings on the market are quoted at 17c for wholes and 17½c for twins.

Potatoes are firm and are up to $1.10 again per ninety lb. bag. Apples are unchanged and prices are holding well at present quotations. Imported strawberries are now on the market and are bringing 40c a box.

Oats have had an advance recently and are not quoted, 49c to 51c bulk per bush.

...GRAIN—Oats, bulk, 49c to 51c; Peas $7.00. ...

FEEDSTUFFS—Bran, $26 to $27; Shorts, $27 to $28.; Middlings, $28 to $29.00; Linseed Meal, 40.00 to 42.00; Cottonseed Meal, 37.00 to 39.00; Gluten Meal, 32.00 to 34.00; Corn Meal, 1.65 to 1.70.

GRASS SEEDS.—Timothy, 8c to 11c; Com. Red Clover, 19c to 24c; Mam. Red Clover, 20c to 21c; Alsike 17c to 20c.

DRESSED MEATS—Beef (carcass), 7c to 12½c; Hogs, 9c to 12c; Mutton, 8c to 9½c; Veal, 8c to 10c.

HORSES—Drafters, 250.00 to 300.; Roadsters, 200.00 to 250.00; Carriage 175.00 to 200.00

DAIRY PRODUCE—Creamery Butter, 30c; Dairy Butter, 24c; Cheese, 17½c.

POULTRY AND POULTRY PRODUCTS.—Eggs, 30c; Fowl, 15c to 18c Chickens, none offering; Ducks, 18c to 20c; Geese, 17c to 20c; Turkeys, 22c to 23c.

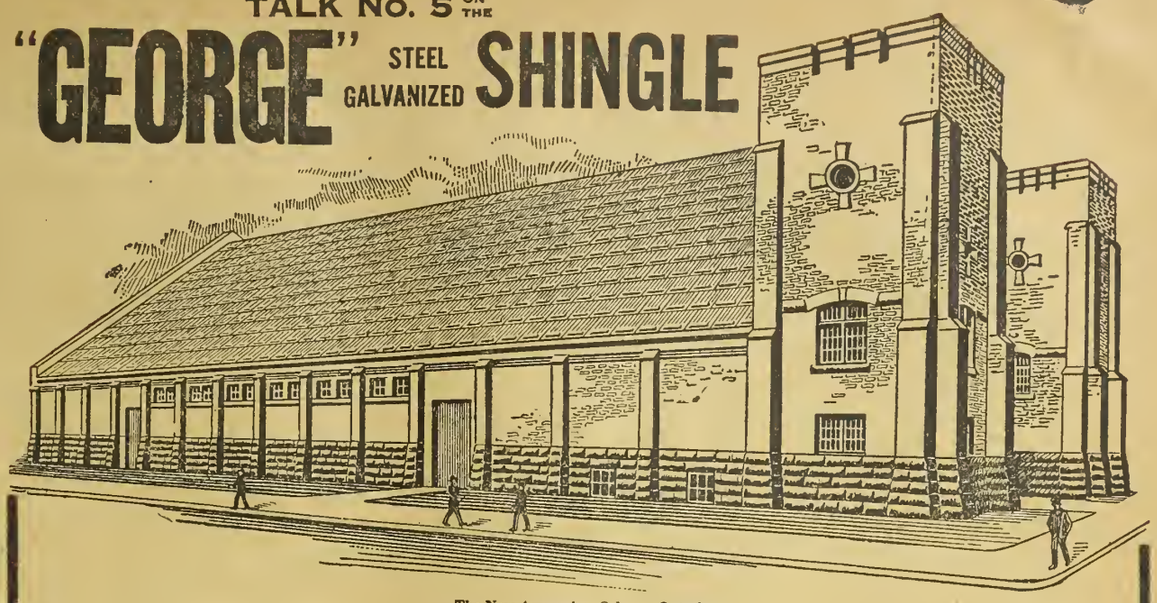
FRUIT.—Apples, 2.50 to 5.00; No. 1 Baldwin, 5.00; No. 2 Baldwins, 4.00 No. 3 Baldwins, 2.50; No. 1 Spy, 5.00 No. 2. Spy, 4.25; No. 3 Spy 2. 0; No. 1 Golden Russet, 5.00. Strawberries, 40c box.

MISCELLANEOUS — Hay 16.00 to 17.00; Wool, 25c to 27c lb.; Beef Hides, 12c to 13: Calf Skins, 18c to 20c lb.: Sheep Skins, 75c to 1.50.

VEGETABLES—Carrots, 2.50 bbl.; Potatoes, half bag, 1.10: Turnips, bag 1.25; Onions, bag 3.00; Parsnips, bbl. 2.00; Cabbage, 2½c lb.

TALK No. 5 ON THE

"GEORGE" STEEL GALVANIZED SHINGLE



The New Armouries, Oshawa, Ontario.

ON the question of cost, our METAL SHINGLES have many points in their favor. A "Pedlarized" Roof is cheaper than any other, because the first cost is the last cost.

You save time and labor by using either the big "GEORGE" Shingle (24 in. x 24 in.) on your barns, or the "OSHAWA" Shingle (16 in. x 20 in.), of identical design and quality, on your houses, sheds and smaller buildings—a wooden roof takes three days to lay, while a "Pedlarized" roof, of same size is laid in one day. No high-priced labor is required.

The long shingle (24 in.) means a great decrease in the amount of sheathing required—another Big Saving.

Laid with hammer, nails and snips only. Effect a saving of one-third in nails.

Pedlar's Metal Shingles outlast the building and the builder.

PEDLAR'S METAL SHINGLES PROTECT YOU FROM

FIRE, WIND, WATER AND LIGHTNING

The All-perfect Metal Shingle. No greater cost, but greater service and satisfaction. : : : :

Couldn't Do Housework

HEART WAS SO BAD.

Mrs. Thomas Melville, Saltcoats, Sask., writes:—"I thought it my duty to write and tell you how much your Milburn's Heart and Nerve Pills did for me. My heart was so bad I could not sleep, eat, nor walk about the house. I could not do my housework at all, what my husband could not do had to go undone. I had two small children depending on me besides three men to cook for, and it worried me to not be able to do anything. My husband had taken some of your pills, some years ago, and insisted on me trying them, so I started, and before I had taken them two weeks I was considerably better, and before I had taken two boxes I was doing my own work again. Anyone suffering from heart or nerve trouble of any kind should just give your pills a trial. If anyone cares to write to me I will gladly give them all the information I know concerning your wonderful medicine."

Milburn's Heart and Nerve Pills are 50c. per box, or 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Bone Spavin

No matter how old the blemish, how lame the horse, or how many doctors have tried and failed, use

Fleming's Spavin and Ringbone Paste

Use it under our guarantee—your money refunded if it doesn't make the horse go sound. Most cases cured by a single 45-minute application—occasionally two required. Cures Bone Spavin, Ringbone and Sidebone, new and old cases alike. Write for detailed information and a free copy of

Fleming's Vest-Pocket Veterinary Adviser

Ninety-six pages, durably bound, indexed and illustrated. Covers over one hundred veterinary subjects. Read this book before you treat any kind of lameness in horses.

You will look a good while before you find a better medicine for coughs and colds than Chamberlain's Cough Remedy. It not only gives relief—it cures. Try it when you have a cough or cold, and you are certain to be pleased with the prompt cure which it will effect. For sale by all dealers.

Stable Sanitation.

(Continued from page 459)

dust, and the dust flying about will infection to the milk. Some of the carry a great deal of very dangerous most persistent germs known to bacteriologists are found on hay. Do not feed hay or any dusty feed of any kind during or just before milking if you can possibly avoid it.

I would like also to speak about some stables that I saw in Scotland. I visited the great cheesemaking districts of Galloway and Ayrshire to find out if I could, how it was that those Scotch cheesemakers could make cheese—the same kind as we have here, because it was Canadian instructors that taught them their present methods of making— that will sell for 1½ and even 2c a pound more than Canadian. I do not mean to say all of it brings such a premium, but some of it does. In visiting this district during the first week of August, going about among the dairies, where the cheese is made — because it is all made on farms where they keep as many as 150 cows— the first thing that impressed me in examining the cheese was to find some of the April cheese, and all the May and June cheese on the shelves. Now although the season had been a hot one, I did not find any cheese that were off flavor or showing any undesirable flavors whatever. The cheese were all perfectly clean in flavor. The cheesemakers here will understand what that means. It would be absolutely impossible for us to make cheese from the milk which we get in factories here in Canada, that would keep sound on the shelves for that length of time, especially if made duting the early part of the season. I had not far to go to discover the reason for this satisfactory showing, because going into the stables I found everything perfectly clean. I remember one in particular; one I visited about 10 o'clock in the morning. That stable had a good cement floor and the stalls were all of solid cement and the walls of brick and plastered smoothly. There was no lodging place for dust or dirt, and the place was well whitewashed. It is whitewashed about twice a year. The stable was just as clean as it was possible to have it. One hundred cows had been milked there that morning and there was not the slightest sign of excrement of any kind. After the rough part of it had been removed, they had scrubbed the whole place out with water, and they did that every day. The man in charge was hauling water some distance for the purpose of scrubbing that stable every morning after the cows were turned out. He did it not because he was paid by someone else to do so. This man rented the cows and paid what they call a cheese rent. He guaranteed to deliver so many pounds of cheese for each cow. It was his business to take care of the cows, to milk them and to make the cheese, and after he had delivered the stated quantity, the balance was his remuneration. Of course it paid him to make good cheese. He understood his business and he found that it paid him to go to this extra trouble to keep the stables in perfect condition so as to have clean flavored milk that would enable him to make the cheese that bring the highest price.

I am sorry to say that a great mistake was made in Canada and in the United States some years ago in advocating the aeration of milk. I believe I can accept some of that blame myself, along with others, as being one of the advocates of aeration. And when we look back on it, there never was any good reason for the practice I believe this to-day as firmly as I believe anything, that more milk is injured by what is called acration

You can get Bigger Yields of Better Quality

From your farm if you will let us help you when purchasing your fertilizers for spring crops.

Agricultural Authorities and Experimental Stations in this great Dominion of ours prove that all crops remove from the soil more POTASH than Phosphoric Acid; therefore, you must use a fertilizer containing more POTASH than Phosphoric Acid.

Having **Acid Phosphate, Nitrate of Soda and POTASH** in stock, can quote you these materials at reasonable figures, and will show you

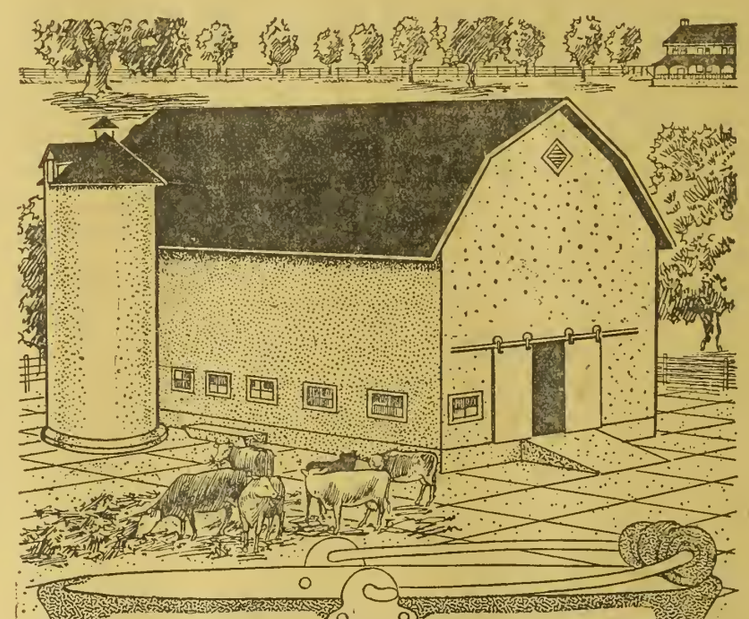
How to Mix Your Goods at Home

and save money by buying raw material and doing your own mixing.

You then know what you are feeding your crops and can be almost sure of bigger yields of better quality.

When next in town drop in and talk it over.

A. R. WETMORE, - - CLIFTON, N. B



Build Concrete Barns and Barnyards

YOU will find that they are best at first and cheapest in the end.

Concrete buildings cannot burn and many dollars are saved in lower insurance rates. They need practically no repairs and never need painting.

Concrete barnyards make the best kind of a feeding-floor and save many dollars in feed bills, as your stock gets every particle that you feed to them.

Send for this free book "What the Farmer Can do With Concrete." It shows just how to build your own concrete barn, feeding-floor or any other building that you may need.

than is benefitted by it. In fact I am not able to learn that there is any direct benefit from the so-called aeration of milk.

We are all pretty familiar with the purifying effect of a liberal use of lime on the interiors of stables, of dairy buildings and such places. I found in Denmark that this sort of thing is practised to a much greater extent than we have ever thought of doing in this country. It may be news to many buttermakers to know that a great many of the cream vats used in some of the best Danish creameries to-day are simply large wooden tubs. You can understand that unless they took extra precautions these tubs would not be in good condition. I was not able to see that any injury resulted to the cream from the use of these wooden vessels for ripening vats. The secret is that they are kept perfectly clean and sweet by a liberal use of lime. Every utensil is immersed in a strong solution of lime every few days, and some of them every day. All the wooden machinery, such as churns, butter workers, etc., are coated with a thick lime wash almost every day. This coating is left on for a short time and before it quite hardens it is washed off. It is surprising how that helps to sweeten the wood and causes it to dry much more readily. The same thing applied to the floors. If they get a little greasy a liberal use of whitewash cleans them very easily and very perfectly. There is nothing that would be of more use to the cheese and buttermakers who desire to have a clean wholesome factory than a liberal use of lime water. It saves a great deal of labor, is cheap, and is a good disinfectant as well. I would recommend the use of lime in that way, not only to the farmers for the purifying of their stables, etc., but also the butter and cheesemakers who wish to keep their factories clean and their utensils in proper condition.—J. A. Ruddick, Dairy Commissioner.

Breeding Principles.

The outlines laid down by Prof. Trueman of the N. S. A. C., in a lecture before the Sussex and Studholm Agricultural Society on the 28th inst were as follows:—

You may select ten of the finest cows of about even capacity of any breed of dairy cattle and a bull of the same breed of the richest breeding that can be had, breed this sire to those cows for a series of years till his heifers come in milk and you will find a surprising difference in milking capacity of those heifers.

There seems to be a natural gravity attending all breeding operations whereby a certain percentage of the offspring revert in quality to ancient progenitors. To keep a herd of cows up to a high standard, if you do not buy females, requires a severe clarifying process; in other words, a constant weeding out. Then, again, it should be remembered that the rejected heifers contain just as good lines of blood as any. If bred in turn to a sire of strong and desirable prepotency they will be very apt to produce a large percentage of heifers that will prove very desirable. By this we can see how important it is to keep constantly in view the great ruling fact, that the sire is the chief consideration in the production of cows of high merit.

In selecting that sire the question is not so much that of family lines as it is of performance lines on the part of the mothers, particularly on the side of his dam's sire. If we find the blood of the sire strong in the qual ty of large motherhood we may be reasonably sure of his imparting that quality to his heifers. But his male calves will be more affected by the motherhood quality of their dams than by him. These are distinctions that breeders should keep constantly in mind. The qdestion of immediate importance is the sire and his individual prepotency. The question of antecedent importance relating to him is the quality of the mothers that lies back of him. If we keep these distinctions in mind we will be more willing to pay a good price for a bull of the right quality.

Breeding Difficulties.

Very often this is caused by the vaginal mucous being too acid, and preventing conception. It is best to try what is called the soda treatment, which is injected about one hour before service takes place and neutralizes the acid condition. The injection is made by dissolving one tablespoonful of bicarbonate of soda in half a gallon of luke-warm water, and may be used twice or three times a week while not in use. Half an ounce of phosphate of soda should be given daily in a feed for ten days or more previous to service. Keep the heifer if anything rather poor, letting her get plenty of exercise by turning her out on rather a bare pasture. Sometimes it is worth while trying another bull, especially in these cases an old one in preference to a youngster. As she has had one calf, it is well worth while to keep her, as good milkers are scarce. Should this treatment not prove successful, write again.—Southern Vet.

A Record Breaker.

The Holstein-Freisian cow Lady Paul Livardy 3rd No. 166035 has broken the record of fat production in the junior two-year class of the semi-official yearly division, by producing in 365 consecutive days 737.66 lbs. fat from 20,936.7 lbs. milk. She freshened at the age of 2 years, 2 months, 25 days. Her sire is King Walker No. 40358; her dam is Lady Paul Livardy No. 86225. She was bred by Mr. J. V. Shugart, Marion, Ind.: and she is now owned by Mr. J. W. Dimick, Rifton, N. Y. In the junior two-year class in this division she displaces Woodcrest Rifton Lassie No. 211541, whose record for 365 days is 726.66 lbs. fat from 19,560.9 lbs. milk. Eight different supervisors were employed in the conduct of this test.

INTERNATIONAL Harvester manure spreaders have a score of good features in their construction. Each one is the result of careful field experiment.

An I H C spreader is low enough for easy loading, yet it has plenty of clearance underneath. The rear axle is well under the load, rear wheels have wide rims and Z-shaped lugs, insuring good traction under all conditions. Frame, wheels, and all driving parts are of steel. Apron tension is adjusted by a simple device. Winding of the beater is prevented by large diameter, and beater teeth are strong, square and chisel-pointed.

International manure spreaders are built in several styles and sizes, low or high, endless or return apron, for small farms or large. Examination will show sturdiness of construction in every detail. Repairs, if ever needed, may always be had of the local dealer.

Examine International spreaders at the dealer's. We will tell you who sells them, and we will send you interesting catalogues.

Eureka Potato Planter

Catalog sent free

No matter whether you grow large or small quantities of potatos, we have a size of planter that is just what you need. The Eureka line of Potato Planters is the largest manufactured. This machine takes only *one* man to operate it. That means less trouble and expense for *you*.

Opens the furrow—drops the seed any distance on depth required—puts on fertilizer (if desired)—covers up—all in one operation. Marks for next row.

It's an easy machine to operate. The steel and malleable iron construction mean lightest possible weight and increased life of machine. Your repair bill will be practically nothing. Plants uniform depth at *all times* because plows directly under the axle. Dropping mechanism in plain view of driver. Does not injure seed.

We supply planters in three sizes, for one or two rows—with or without Fertilizer Attachment.

For 15 years the Eureka Potato Planter has been successfully used throughout the world.

We also make Eureka Potato Cutters and the Eureka Mulcher and Seeder—a mulcher, smoothing harrow, cultivator, weeder, seeder.

several days ahead the coming of wet weather thus enabling growers to spray their trees in time to ward off the disease. The time to spray is always before instead of after a rain. The spray usually drips in from 10 to 20 minutes and will then take many rains to wash all off.

CONCLUSION

I was very much interested to hear Professor Cumming state that he had good hopes of the appointment of a well-trained, experienced plant pathologist to help you in your various plant diseases. When I think what an array of able men Nova Scotia has already got or is getting who are enthusiatically devoting themselves to the study of your plant diseases, insect pests and other problems, I am not only hopeful but certain that in a very short time Nova Scotia fruit will be far famed for its freedom from blemishes by insects or disease. In Prof. Blair, Mr. George Sanders and your Provincial Entomologist, Prof. Brittain, you have three men whom I know well and whom I consider the equals of, if not superior to, any other these men in these same lines of study in Canada. You are to be highly congratulated on having such men. Make good use of them and you will find their advice and assistance invaluable.—Professor Caesar.

The Sussex Seed Fair.

In recent issues of The Kings County Record, the query "Do the farmers of Kings County want a Seed Fair?" was asked. All who attended the fair held on Saturday, the 28th inst, got their answer when they saw the splendid display of seed grain and potatoes made by the farmers.

The Seed Fair is not a thing of the past. We are of the opinion that it is the dawn of an era of great development in the seed growing circles of Kings County.

S. J. Moore, Maritime Representative Seed Division and S. M. Fiske, Florenceville, N. B., the expert who judged the Field Crops Competition for the past two seasons in Kings County, were the judges. The attendance was all that could be desired, and when at 2.15 p. m., Prof. Trueman, of the N. S. A. C., opened his address on "Improving the Dairy Herds of the District" in the commodious Assembly Hall, of the Dairy School, every seat was taken in the very best possible attention was given to the address, which was considered by many of the prominent farmers present to be one of the ablest addresses delivered before a Sussex audience on a question of this kind.

At the close of the address a unanimous vote of thanks was tendered Prof. Trueman and everybody expressed the wish that ere long he would have an opportunity to again stand before a Sussex audience.

Following is a list of the awards:

Wheat, Red or White Fife, 4 entries —1, Bowser Bros., Rockville, $4.00; 2, J. S. McFarlane, Sussex Corner, $1.50; 3, Stanley M. Hayes, Sussex Corner, $1.00; 4, W. J. King, Smiths Creek, $0.50.

Wheat, any other variety—4 entries —1, H. B. Parlee, Sussex, $4.00; 2, McIntyre Bros., Sussex Corner, $1.50; 3, Thos. A. Kyle, Sussex Corner, $1.00; 4, Jas. Payne, Hillsdale, $0.50.

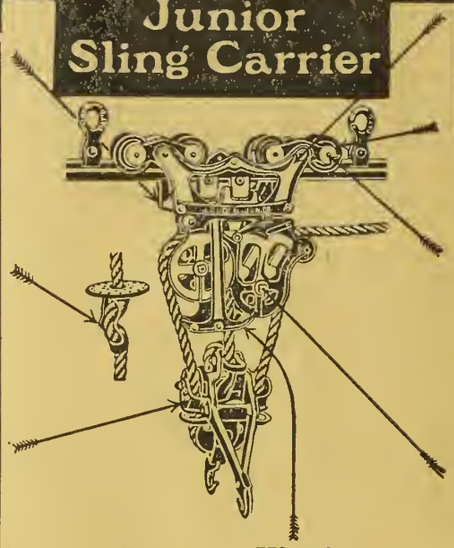
Barley, six rowed—1 entry—1, W. J. King, $4.00.

Oats, any White variety—10 entries —1, H. B. Parlee, $4.50; 2, J. H. Manchester, Apohaqui, $2.00; 3, Bowser Bros., $1.75; 4, T. J. Davis, Farlane, $0.75; 8, Irvine Mosher, Sussex, $0.50.

You save time and money

on every crop you harvest with the aid of a

LOUDEN Junior Sling Carrier



Patented Brace Block

A heavily ribbed malleable iron block attaches to the truck arms just below the track, and the bolt connecting the sides of the carrier frame passes through the lower end. This takes all strain off the bolt and increases the strength of the truck arms. No load can spread them.

Adjustable Trip

Used when desired to carry the load into the mow without elevating to the track. Slip it up or down on the centre draft rope as desired. A simple, effective adjustment without complicated parts. This trip is supplied when ordered without extra charge.

The Great Triple Purchase Feature

Three ropes lifting the load instead of two, as with the ordinary carrier; gives the horse one-half more power, reduces the strain on the ropes and lengthens the life of the outfit.

Engine Trucks

Distribute the load well along the track, increase the strength of the carrier and cause the load to run more steadily. No four-wheeled carrier, however much spread out, is so easy on the track or runs so steadily.

Short Truck Arms

The Truck Arms are only 5 inches long, nearly straight and extremely well braced. They cannot be sprung.

The Unbreakable Axle

These Axles are simply an extension of the main frame. Note how they are shouldered out at the frame; impossible to break them. No riveted or bolted pin axles are used on Louden Carriers. Such axles are always causing trouble.

Patent Bushings

The Pulley Sheaves run on Patent Bushings, recessed into the side of the frame. This takes all the strain off the bolt and puts it on the frame where it belongs. The sheaves are large, of extra strength and easy running.

Sure to Work

A trip stirrup extends below the carrier frame and attaches to the locking mechanism. It is impossible to keep the horse going on the draft rope and not bring the sling pulleys in contact with the trip stirrup. Once this is done the car is bound to leave the stop block and run back into the barn with the load. Side winds or uneven loads, cannot affect the proper working of the LOUDEN JUNIOR SLING CARRIERS.

Write for catalogue and special descriptive circular dealing with above Carrier.

At the close of the afternoon lecture the first prize samples in the first eight sections of the prize list were sold at auction and realized the following prices.

Red Fife Wheat, 1 bush.—$1.25.
White Russian Wheat, 1 bush—1.25.
Six Rowed Barley, 1 bush.—$1.30.
Banner Oats, 1½ bush.—$2.00.
Rough Buckwheat, 1½ bush—$2.00.
Smooth Buckwheat, 1½ bush—$2.00.
Field Peas, ½ bush—$2.60.

The Prince Edward Island Horse Show.

The Second Prince Edward Island Horse Show was held at Charlottetown on Wednesday and Thursday, March 25th and 26th.

The number of exhibitors was not as large as could have been wished, but the crowd in attendance was almost to great for comfort.

Classes were opened for Clydesdales or Shires, for Grade Draft Mares, for Carriage Stallions and Mares and for Roadsters. The chief exhibitors were David Reid, Victoria Cross; J. H. Crosby, Marshfield; T. P. Cass, North River and H. H. Acorn, Souris. David Reid won the championship for Clydesdale Stallion. Robt. I. C. Hill, Fredericton, P. E. I., for Carriage Stallion and Hammond Kelly, Southport, for Roadster Stallion.

The heavy horses were judged by Mr. R. Robertson, Ex-Superintendent of Experimental Station, Nappan, and now Institute lecturer in Prince Edward Island. The light horses were judged by W. J. Reid, B. S. A., Instructor in Animal Husbandry. The first classes were called out at 2 p. m. on Wednesday. At 5 p. m., the Carriage and Roadster Stallions were shown on the street. At 7.30 p. m., judging was resumed in the Agricultural Hall and completed at 10 p. m.

On Thursday afternoon a sale of horses took place, 22 going under the hammer. The prices ranged from $100 to $700 the average being a little over $300. The attendance at the sale was about 800 but there did not appear to be a great number of buyers. A Clydesdale stallion 3 years old offered by the Falconwood Hospital for Insane was worthy of special noial notice. He was of excellent quality and very trappy. He was, however, considered by some to be somewhat undersized. He was bought by Mr. Neil McKenzie of West River for $500. Benjamin Carter was auctioneer and gave the best of satisfaction.

On Thursday morning the annual meeting of the Horse Breeders' Association was held when the officers for the ensuing year were appointed as follows:

President—W. W. Crosby, Cornwall; Vice-Presidents, Jabez Lea, Victoria; H. H. Acorn, Souris. Directors—John Richards, M, L. A., Bideford; T. P. Cass, North River and David Reid, Victoria Cross.

Look Here Sir!

If you can get a suit valued at $25.00 in Canada for $12.50 from Catesbys in London---Will you buy it?

We undertake to prove to you that you can—if you buy from us.

You've heard that clothing is cheaper and better in London. You know, also, that you can't beat the quality of the genuine English Fabrics.

When, therefore, we guarantee to sell you a suit made of fine English cloth, cut in the best Canadian, New York or London style (as you prefer), laid down at your door, all duty and carriage charges prepaid, for a price about one-half of what you would have to pay in Canada, isn't that worth looking into? Of course, it is.

Then sit down right now, fill out the coupon below, mail to our Toronto office, and get our latest Style Book and patterns. With this book is a letter explaining our system of doing business and a self-measurement form which is so simple that you can't go wrong in using it. We'll also send testimonials from many satisfied Canadians who regularly buy from us.

Get these Patterns now and be convinced

If you don't want to cut this paper, write a postal or letter, and we'll send the patterns anyway, but to get them **you must mention the Maritime Farmer.**

Maritime Farmer. Coupon No- 1.

Making Hogs From Pigs.

The pig intended for market has but a few months to live at most and may, therefore, be fed regardless of effect upon constitution, which must be considered in the case of breeding animals. There should be no let-up in forced feeding from birth. Pigs will begin to eat shelled corn at three or four weeks old. A little milk or slop at this age will hasten growth.

Good pigs should weigh from 60 to 80 pounds when weaned at three months old. They should then go on aflalfa, clover or other good pasture and have corn twice daily. Have ready for them late in summer a pasture of rape, field peas or soy beans, besides corn. If their teeth become sore, change to shelled corn, soaked for twenty-four hours and slightly salted.

To keep celery crisp for several days, first clean it, then wrap it in a soft cloth and lay it on the ice in the ice box.

A FARMER'S GARDEN

Helps his wife to plan her table in busy times. Saves work and worry, saves buying so much meat, gives better satisfaction to the help. A good garden will be almost impossible in your busy life without proper tools. They cost little and save much hard work.

IRON AGE WHEEL HOES AND DRILLS

will sow, cultivate, ridge, furrow, etc., better than you can with old-fashioned tools and ten times quicker. A woman, boy or girl can do it. Can plant closer and work these hand tools while the horses rest. 38 combinations from which to choose at $3.00 to $14. One combined tool will do all of the work. Ask your dealer to show them and write us for booklet, "Gardening With Modern Tools" and "Iron Age Farm and Garden News" both free.

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

"My little son had a severe cold. I was recommended to try Chamberlain's Cough Remedy, and before a small bottle was finished he was well as ever," writes Mrs. H. Silks, 29 Dowling Street, Sydney, Australia. This remedy is for sale by all dealers.

Drugs and Old-Fashioned "Recipes."

It is curious that one form of cruelty inflicted on animals is due to the fact that those who are guilty of it are proud of their charges and honestly anxious that they should do them credit. With this object in view they will actually go to the expense of buying drugs, sometimes making use of "recipes" which are treasured up as great secrets not to be parted with to anyone else except for a good consideration and use them more or less recklessly upon the animals. It must be admitted that it is not altogether from unselfish motives that this course is followed, because some of the drugs act as "coat shiners," and enable a man to make his horse look well without all the trouble that good and careful grooming entails; but the fact remains that in a great many cases the offender is really sincerely anxious for the welfare of his charges, and if he does harm it is through ignorance. None the less, the offence is one that should be sternly repressed, for very heavy losses of valuable animals frequently occur, and so general is the practice in some districts, that farmers have been up in arms about it, complaining bitterly of the damage done.

Arsenic and antimony and nitre are ingredients often used, and the danger largely results from the ignorance of the stableman of the fact that many drugs are cumulative in their effect, and that the continued dosing with small quantities may eventually result in poisoning the animal. Unfortunately, the evil goes on because the farmer rarely knows anything about it until a serious illness or fatality occurs, and because when he does learn of it he is soft-hearted and does not like to prosecute. Magistrates, too, fail to appreciate the gravity of the matter, and inflict inadequate punishment, or even let the offenders off with cautions. It should be made clear that, whatever object a servant has in view, he is committ- drugs secretly to his master's ani- drugs secr(tly to his master's animals, and the farmer is advised to look around the stable occasionally, to cast a glance into the corn bin, where evidence may sometimes be found that the practice is in vogue. Little bits of paper that may have contained powders may be picked up, or even samples of the drugs hidden away, and careful watch may be the means of preventing heavy loss. A reprimand and warning should be given and prosecution should certainly follow a second offence, whatever the result may be to the animals.

STRANGE RECIPES

Recipes in use on the farm are often of very stragne composition. They are perhaps not more absurd than some of those in use for human beings in the dark ages of medicine, but they seem to have survived much longer, and come up now and again even in this age of general education. They are sometimes handed down from father to son as a valuable legacy, and are found in the possession of men who read little and are quite unaware of the great advances made in veterinary treatment—indeed, who in many cases do not know what they are asking for when they take their list of "drugs" to the chemist. "Oil of man" and "Oil of woman" are not found in the British Pharmacopoeia, but they are in use, and the country chemist, who has learnt his business in a rural district, probably smiles as he fills them up from the same bottle, which bears quite a different name on the shelf. Some of these recipes are marvelous in the number of ingredients that enter into them. It would almost seem as if the compounders felt that if they only put enough shots into the gun some of them would be bound to hit the object aimed at. Here are a few of them used in a single recipe: long pepper, tumeric, aniseed, flowers of sulphur, fenugreek, liquorice, elecampane, and bay berries. Oak rind, nettles, yarrow, and bramble buds are used in various quantities—a little more or less can make no difference!—quite after the style of the old herbalists, and indeed "herbal treatment" holds its own largely in rural places. Filthier ingredients are in use also, and chamber lye is credited with wonderful medicinal properties. So far as most of the recipes are concerned, probably the chief harm they do is that the effective treatment called for is delayed, sometimes with serious results; but occasionally they are actively harmful, and it is to be hoped that farmers will decline to allow their animals to be experimented with, and will recognize more generally that there are now ontainable drugs in the form of tabloids with properly regulated doses for their use, if drugs be really needed.

SURGICAL METHODS.

It is not, however, only in regard to medicine that ancient and dis-

The Fence No Strain Can Sag

Maritime Fence remains taut and trim after years and years of hard usage. It simply cannot sag or get out of shape. Made from extra-heavy imported hard-drawn steel wire, thicker, stronger, and galvanized so it is peel-proof.

Maritime Fences are tested rigidly before leaving our factory. We know they will withstand far greater strains than any they are likely to endure. The simple lock with the bull-dog grip—never lets go.

Our Fencing is made from Standard Gauge Wire. Other makers use SCANT WIRE. WE DON'T. Full weight, full measure, 16 oz. to the pound in every case.

It would pay you to act as our agent.

To Be Able To Deduct One Grain Of Useful Suggestion Amongst A Heap Of Worthless Advice Is A Great Power, Truly

We pick out the Grain and hold it up for observation, when we tell you that

EDDY'S WARES

are the most reliable and the best, representing as they do. over 60 year's experience.

It is for you to benefit by this advice and insist every time upon having **NONE BUT EDDY'S.**

THE E. B. EDDY COMPANY
Makers of Matches, Fibreware Articles, Paper and Paper Bags.

credited practices prevail, for some of the surgical methods are even worse in the sense that they cause more immed ate and unnecessary pain. Bleeding has almost died out, hut unnecessary blistering and cauterising, and the use of crude ointments applied to wounds are still too be met with. For all these things much of the blame must be attrihuted to the old farriers' books kept on the shelves and religiously consulted from time to time. They are hopelessly out of date, but a recipe in print is sacred and they are put in use with every confidence that the right thing is heing done. There are so many really good handbooks now issued, containing up-to-date methods of treatment of stock, that there is no excuse for a farmer who refers to ancient puhlications. They ought ta be burnt or stored away in museums as curiosities.

COMMON TROUBLES.

Among "recipes" of quite a different character may be mentioned some cruel methods of dealing with common troubles. The use of paraffin for the destruction of lice is anample. It is dangerous, not so much because of the inflamahle nature of the material with which the coat of an animal is sometimes saturated—there is certainly some risk if a naked light is used—as hecause paraffin so used may cause severe hlistering of the skin which will torture the animal and may take some time to heal. Even more foolish and cruel is the use of mechanical irritants in the case of eye troubles, which are common among cattle and sheep, sometimes in the latter appearing almost to take the form of an epidemic. Chaff often falls into bullocks' eyes, and the obvious remedy, as soon as the injury is detected, is to endeavour to remove it. It is not an east matter, but can generally be done by a patient attendant with the aid of a little Venice turpentine; if this is placed on the finger the intruding morsel may be made to adhere to it and to come away. Some people actually blow powdered white sugar, chalk, oralum—we have even heard of the use of powdered glass—by means of a quill, into the eyes of suffering animals. This is shocking cruelty and can only increase the trouble whatever may be its first cause. Animals suffering from affections of the eye should be kept in darkened stalls, and have the eyes bathed, and be treated in much the same way as are human beings in similar circumstances.

A frequent cause of suffering to animals is misconception of the actual evil to be dealt with. Mange, for example, is often confused with eczema, and remedies that are perfectly suitable in the one case are absolutely useless in the other. The result is not only that the great evil is untouched but that the complaint often extends to other animals. The loss to a farmer may be considerable, and it would certainly pay him, if he does not care to get expert advice, to invest in a "magnifying glass" by means of which he would be able to detect the presence of the mange insect. While the farmer is mistakenly applying remedies for a "skin disease" to an animal suffering from mange, the real trouble is probahly spreading among other members of his stock, and becomes a serious matter, while the necessary isolation is perhaps made impossible, owing to the number to be dealt with. Mistakes in diagnosis are responsible for many serious errors in treatment, and we recall one of a very singular character, where a sheep farmer concluded that lameness in his flock was due to a worm in the foot, and deliberately proceeded to dissect from the limb a portion of the anatomy—the biflex canal—possessed by every sheep in the world. The owner referred to had taken a great deal of trouble with the intention of relieving his sheep from their complaint, but what he effected was to cause them serious suffering, and he was guilty of cruelty. "Ignorance of the law excuseth no man" is a well-known legal maxim; certainly ignorance of anatomy affords no excuse for a man who, notwithstanding his ignorance, venture to perform surgical operations. Indeed, we are constrained to believe that in the aggregate quite as much suffering is caused to domesticated animals by the activity of well intentioned but ignorant attendants as is due to downright cruelty.

The use of the "recipe" which calls for burning straw to be placed between the legs of a jihbing horse in orller to induce him to move deserves stern reprobation and punishment. It is not only wicked but silly; it may lead to serious accidents, and if the animal, as is very likely, moves only a few feet away itis not only useless to serve its purpose, but may result in damage to the owner's property, while ohviously there is a risk of serious injury to the animal himself.

Breeding for Heavy Layers.

The inheritance of heavy egg production is transmitted through the hen to her sons, and through the male to her daughters and sons. At least the very careful investigations of Dr. Rgymond Pearl indicate this. It does not follow, however, that all the sons of a prolific hen can transmit in the same way. Through a very careful system of trap-nesting and pedigreed breeding each bird must be tested. This work is beyond most poultrymen.

Fertilizers for Potatoes.

Editor Maritime Farmer:

The potato crop demands a deep, well prepared soil, having a liberal supply of humus and available plant food. The lighter and more open soils are the best for potato production. However, good results can be obtained on the heavier soils, providing that they are deeply worked and well supplied with humus.

For potato production the soil should be thoroughly prepared and worked to a considerable depth. The depth of preparation of the soil is one of the most important factors in the production of this crop. In cultivating the soil at a considerable depth it must be remembered that the cold inert subsoil is not to be brought to the surface. By leaving a good depth of well prepared soil, conditions are rendered favorable for the development of an extensive root system. This factor is of considerable importance as the potato is a gross feeder.

Closely coupled with the question of cultivation is that of humus. When well supplied with humus, the soil is much more easily cultivated and it becomes more retentive of moisture, which is a factor of vital importance. A soil rich in humus is friable and porous, giving ample opportunity for air and water to move through it. Further, the humus in decomposition has considerable effect in rendering available much of the insoluble plant food in the soil.

The potato crop requires a liberal supply of plant food. This fact is now commonly known. In our potato producing districts heavy applications of high-grade mixtures are made and found profitable. In these districts the extensive use of fertilizers has become common only after several years of experience. It is then based upon the results of actual and profitable practice.

Potatoes demand a fertilizer rich especially in nitrogen and potash. Phosphoric acid, though essential in the production of the crop, is not needed in as great a proportion to the other ingredients, as is the case with some of the other crops. Though nitrogen is of importance, an excess of this element will cause great growth of "tops" at the expense of the development of the tubers. We frequently have a concrete example of this condition where a heavy application of barnyard manure is made for potatoes; the result being a heavy development of tops accompanied by a comparatively low yield of tubers. This condition is due to the high proportion of nitrogen to the other plant food substances in the manure.

Potash effects particularly, the formation of starches, sugar, and wood fibre in the development of the crop. As considerable starch goes in the composition of the potato, potash is then of special importance as a fertilizer ingredient. In fact, it can be stated, that as a rule, potash is the dominant fertilizing ingredient for potatoes.

It is impossible to state definitely the best fertilizer mixture for potatoes. Conditions of soil cultivation, and cropping vary to such an extent that each farm is a problem by itselfself. The best that can be done is to outline what has, in general experience, been found profitable. The individual farmer can thus vary such a mixture to meet his particular requirements. These requirements he can only find by conducting actual field tests.

The following has been found to be generally successful.

80 lbs. Nitrate of Soda; 70 lbs. of Ammonia; 400 lbs. Acid Phosphate; 160 lbs. Sulphate of Potash, or about 800 lbs. of a mixture analysing 3.5 p. c. Nitrogen; 8 p. c. Phosphoric Acid; 10 p. c. Potash.

The combination of Nitrate of Soda and Sulphate of Ammonia has been found to give the best results. This is probably due to the difference in availability, the Nitrate being immediately available to the crop and the Sulphate of Ammonia becoming so a little later in the season. The amount of Nitrogen used would depend upan the amount of barnyard manure applied and upon whether or not the potato crop follows a clover sod.

Slag may be used instead of Acid Phosphate, in some cases, providing that it is applied very early in the spring, and that it is broadcasted instead of being put in the row. The latter point is mentioned as the alkilinity of the slag due to the lime content would tend to help the development of scab. Slag and Sulphate of Ammonia should not be used together as the lime in the slag would tend to cause a loss of ammonia as a gas.

It has been generally recommended to use Sulphate of Potash in preference to Muriate of Potash as the former is supposed to produce a better quality of tuber. However, this question has not been satisfactory solved for Canadian conditions. It is the opinion of many that providing the soil is light and well drained and that the fertilizer is applied early, the Muriate will probably be satisfactory.

It is preferable to apply the fertilizer some time before the plant the crop, thus giving some time for the dissolving of the plant food by the soil water. The fertilizer or at least three-quarters, should be applied broadcast, the remainder being applied to the row. By this means the fertilizer is distributed evenly throughout the soil. Thus the fine feeding roots of the crop, which extend all through the surface soil can readily reach the plant food. If the fertilizer is all applied in the row, it is confined to a narrow space under the plant, while the feeding roots are spread throughout the soil. By broadcasting, the fertilizer can be applied sometime before the crop is planted, which is of importance, particularly in a dry season.

We notice, then, that in the production of potatoes, the deep cultivation of the soil and the incorporating of a large amount of humus are two essential factors in the preparation of the seed-bed; that a liberal supply of fertilizer containing a relatively high proportion of potash must be applied and that the fertilizer should be broadcasted sometime previous to the time of planting.—E. A. Lods.

Laminitis or "Founder."

This is an inflammation of the sensitive laminae of the feet, and is a serious disease which should be dealt with by the vet. It is ascribed to many different causes, such as feeding with wheat or overfeeding, or the use of unsuitable foods generally, to gulloping on hard roads and to many indirect influences. The affected animal shows signs of severe pain, and shifts its feet very frequently; the feet are hot, and the animal does not care to move about. All four feet may be affected, but the fever is most generally found in the fore feet, and the hind legs are found drawn up under the belly to relieve the front of the weight. The shoes must be removed, and the feet poulticed and kept constantly wet. Enforced movement is beneficial, but an attempt should be made to ascertain the cause of the attack, and the treatment varied accordingly. In severe case the feet are permanently damaged, dropped soles and pumiced feet being developed, and these are incurable. Many cases, however, make a good recovery; hence it is wisest to get skilled advice without loss of time.

YOU Need this BOOK!

THE KARAKUL SHEEP

IN AMERICA

A BOOK OF 48 PAGES WITH 15 ILLUSTRATIONS

BY

Professor J. Walter Jones, B. A., B. S. A.

Author of "Fur-Farming in Canada"

Price 60 cents, Postpaid

This book gives a thorough going account of the efforts made to introduce the Karakul Sheep into America in order to secure the domestic production of Persian Lamb and Baby Lamb furs and save $10,000,000.00 to America yearly. By means of tables, it demonstrates clearly the present location of the valuable sheep imported in 1913, as well as of the few good ones imported in 1908. The possibilities in this kind of fur farming can be imagined when it is known that a lamb from a Karakul sire and an ordinary Lincoln or Cotswool ewe is worth several times as much for fur as the usual lamb is worth for meat when six months of age. It would be well for fur farmers to read up on the possibility of fur production with animals already domesticated. More Persian Lamb fur is sold yearly than Silver Foxes, Mink, Skunk, and Otter combined.

The Importance of the Bull

The following extract from Circular 135 issued by the Ohio Experiment Station is squarely to the point:

"The apparently high cost of a good bull is far outweighed by the greater value of his progeny. Such a bull, used on a common herd, should easily increase the average production of his progeny 1,000 lbs. milk or 40 pounds of fat per cow per year above that of their dams. One Holstein-Freisian bull used in the Ohio experiment station herd increased the average production of sev en daughters 1,299 pounds of milk and 40 pounds of butterfat per year above that of their dams. Forty pounds of fat per year for six years (average producing period) by each of seven cows would be 1,680 pounds at 30 cents per pound equals $504. This animal cost $100 when a calf. One bull used in the station herd decreased the average production of his 11 daughters over 700 pounds of milk and over 45 pounds of butterfat per year below that of their dams. Forty-five pounds of fat per year for six years by each of 11 cows would be 2,970 pounds, which at 30 cents per pound would equal $891. The immediate difference in money value of these two bulls on these herds of less than 20 cows each was $1,395. Both bulls had an equally good chance to increase the production. The figures given above take no account of the advantageous or detrimental effect on the progeny of these daughters.

"In improvement by 'grad ng' it is very important that successive sires be of the same breed. By using this method, a few generations will give animals which, so far as appearance and production are concerned, cannot be distinguished from pure-bred animals. Four generations make them fifteen-sixteenths pure. So far as production is concerned, a grade herd carefully selected and bred to good bulls of one breed is preferable to the average pure-bred herd without selection. Indriscriminate crossing, or the use of bulls from different breeds, gives very uncertain results."

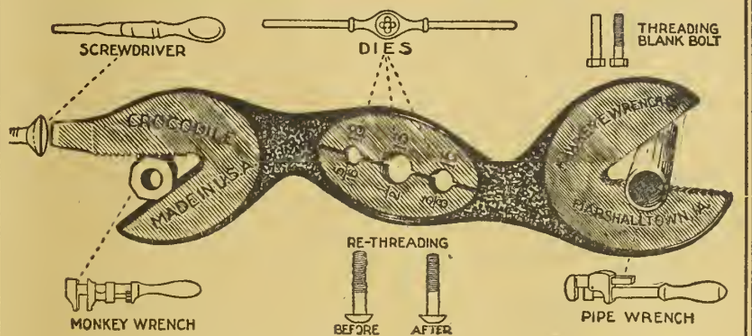
The Crocodile Wrench

An All Around Handy Tool for the Home, Farm and Shop



Six Handy Farm Tools in One

The Crocodile Wrench is drop forged from the finest tool steel and scientifically tempered. Every wrench guaranteed against breakage. It is 8 1-2 inches long and weighs ten ounces.

A pipe wreuch, a nut wrench, a screw driver and three dies 5-16, 3-8 and 1-2 inch for cleaning up and re-threading rusted and battered threads, also for cutting new threads on blank bolts. Dies will fit all bolts used on standard farm machinery.

Teeth and dies are case-hardened in bone-black, making them hard and keen.

The dies on this wrench alone would cost $1.50, and would be worth more than that to every farmer, as they would often save valuable time, besides an extra trip to town for repairs.

Sold everwhere for 75 cents cash.

How to Procure a Crocodile Wrench

On receipt of $1.00 we will send you the Maritime Farmer for one year and also one of these Crocodile Wrenches. New subscriptions will date from time of receipt, renewals from date of expiration of present subscriptions. Or for 75 cents cash we will send you a wrench.

F. G. JAMES, Bowmanville, Ont.

Wanton Slaughter of Dairy Heifers Detrimental to Dairy Interests.

(Continued from page 455.)

peal to him. The quick and regular monthly returns, the distribution of labour over the entire year and the certainty that his farm is steadily growing more fertile will always be strong arguments in its favor. The greatest need of the industry today is more real good cows, good dairy grades bred right and trained to be persistent milkers.

The Province is not in earnest yet about breeding better cattle. Even in what are supposed to be good dairy sections $1.00 stops the pure bred sire. It don't matter if the pelt of a bull calf (if the luck is such) pays for the service. The free service mongrell gets the heavy end of the business. It matters not if his get when mature is $25.00 or $50.00 less valuable than the get of a good pure bred, the profit seems no inducement. A bird in the hand looks better than a whole flock in the bush in this case.

During the past season many dairy cows, and cattle that we cannot class as dairy cows, have left the Province, the well-bred ones to make a reputation for the kind of stock to be had on P. E. I., the mongrel scrubs also to make a reputation as to the class of stock we breed in the Province.

I was sorry to read a contribution from a correspondent in Ontario in reference to an importation of cattle from our Province. "They brought much lower prices than lacal stock, being of very poor quality, yet it was claimed the importer made money on his venture, which it was cited could be taken as evidence of the much lower value of cattle on P. E. I. than in Ontario." This article appeared in a November number of "Farm and Dairy" and was poor advertising for our live stock.

What are we going to do about it? Get to work with the best pure bred bull obtainable and stick to his kind until we have a valuable herd of some distinct species, or continue changing irom one pure bred to another with a generous mixture of all of them at once? This has an important bearing on the dairy industry and the permanent prosperity of the Province. It is for this association now assembled to offer some suggestions. I think that the offering of prizes, either by this association; or private creameries should induce the breeding or grading of the winning herds and whether or not a pure bred bull is now being used. I would take chances that the good cows will be found to trace their goodness to a pure bred sire.

In conclusion let us not forget that dairying increases the prosperity of the community in general in which it is conducted to a greater degree than any other line of farming. If more labor is needed, better buildings and more capital needs be invested, sa much the better for the community. We should aim to increase the producing ability of our farms each year. Nothing is so important as a fertile, clean farm, one that can be depended upon to grow a paying crop in unfavourable as well as favourable seasons.

Successful dairying will be accom-

Successful dairying will be accomplished if intelligently and persistly followed. We should stand by the industry that has proved so profitable in the past and has such promise for the future.—Paper prepared by W. M. Lea to be read at the P. E. I. Dairymen's Association.

Take a Look at a Farm Fence Worth Building

Looks strong, doesn't it? It "is" strong. It's made to last. All made of No. 9 hard steel wires, both horizontals and uprights. Heaviest fence wire used. That's why "Ideal Fence" always stands erect, and resists all destructible elements.

"Ideal Fence" is easy to build, fits any surface, hilly or level.

IDEAL FENCE

May not be the cheapest Fence from a purchase point of view. No, but if you consider the cost of "Ideal Fence" from the point of view of the good material, perfect construction, a very long service, then certainly, "Ideal Fence" is the cheapest.

Why is it the most economical Fence that can be bought?

1.—Because being built very strong, it requires less posts.
2.—Having less holes to dig, labor is saved and the entire cost of erection is reduced.
3.—With all this economy it will last longer than any inferior fence, and not cost half as much for its maintenance.

Only these three reasons would justify the preference to purchase "Ideal Fence" above all others, and yet there are many more reasons why.

Consider the safety of farm products, as well as cattle, etc. protected from without and within from the most reliable fence at medium prices.

"Ideal Fence" means Quality, Durability, Safety and Economy.

ORDER YOUR

POTASH

AT ONCE

Order your POTASH at once. The Potassic and Phosphatic Fertilizers should be applied to the soil as soon as the land is workable so that the crop can get the full benefit of these materials in the first season.

Many disappointments with fertilizers are due to the fact that they have been applied too late for the crop to get full benefit from them, although ensuing crops always benefit. Remember these fertilizers are not used up in the first season but are effective for several seasons.

Nitrate of Soda should generally be applied as a top-dressing at planting time. Slower acting Nitrogenous fertilizers can be applied earlier with other materials.

MURIATE OF POTASH
AND
SULPHATE OF POTATH

can be obtained from the leading fertilizer dealers and seedsmen.

WRITE for our FREE, educative bulletins, which include:

"Artifical Fertilizers; Their Nature and Use"
"Fertilizing Grain and Grasses"
"Fertilizing Orchard and Garden"
"The Potato Crop in Canada"
"Fertilizing Hoed Crops"
"Farmer's Companion" etc.

THE APIARY

Handling the Bees.

Spring Management.—In this province, bees are practically all wintered in cellars. We shall begin to discuss their management from the time they are put out in the spring.

The Time to Put the Bees Out.—Do not be in too much haste to get the bees out of the cellar in the spring. If you can keep them quiet, leave them alone until the soft maples are in bloom.

Choosing the Day.—First get everything ready, so that all the hives can be carried out at one operation. Watch the weather closely, especially after a few nice days, for it is very changeable at this time of year. When the wind gets in the east, and it commences to get overcast, with lazy clouds, and has every appearance of bad weather for the morrow, commence about sundown and carry out all the bees, even if it takes you all night—and if it begins to rain before you are through, so much the better, for you don't want any bees to fly away until they have been out for two or three days, if you can help it. During this time, they will become nice and quiet and when a fair day comes they will commence to fly, only a few at a time, and will not mix or rob.

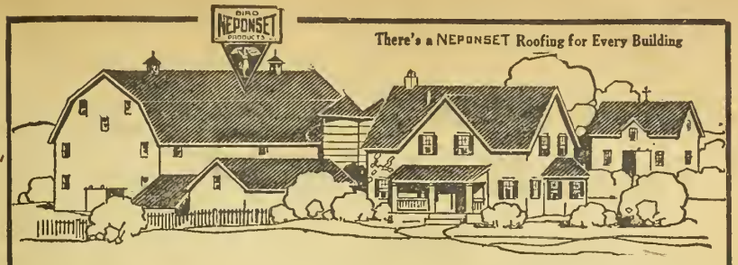
Feeding.—When carrying them out, mark all light colonies for feeding. Make a good, thick syrup, using granulated sugar, two parts, water one part, by weight; The water should be poured on the sugar boiling hot, and the mixture stirred until the sugar is all dissolved. For feeder, use any hive feeder that is convenient; the Alexander or the division-board feeder are both good. Caution—Do not feed out of doors for fear of starting robbing. The hives should be given all the protection possible, the entrances contracted and the bees left pretty much to themselves, till dandelions and fruit bloom.

Examination.—On the first warm day after fruit bloom is out and the bees are working briskly, open up the hives and "take stock" of your bees. Clean off all superfluous wax from frames and parts of the hive. Catch and clip the wings of the Queen. Cut off about 1-3 of both wings on one side. This will prevent the loss of the first swarm, if swarming is allowed, also serve in the way of a mark for keeping a record of the age and efficiency of the Queen. If there is some old seated stores in the brood chamber, break the capping of a part or all of it, by lightly scraping the surface with a knife.

Take a look into each colony about once each week to note progress. When fruit bloom is over and the honey-flow from this source is cut off some of the colonies, that have large numbers of larvae, may require some feeding. Do not allow a shortage of food supply to interfere with the production of brood at this season. It is good bee-keeping to use every effort to increase the number of bees in each colony as much as possible, before the clover honey flow opens.

Putting on Supers.—When everything possible has been done to increase the army of workers, then we are ready for the clover honey flow. Watch for the first White Clover blossom. When it appears then you may be sure that in about ten days the great rush will be on. While there is no fixed time for placing the supers on the hives, this should be done in good time. It is better to be a little early than too late.

Swarming.—To the person keeping bees on a commercial scale, there is probably no other one thing that causes so much worry, as the habit



HERE'S one thing about roofings you ought to know—a "slowly made" roofing is the only kind that is slow to wear out.

Every foot of NEPONSET Roofing is made, not on the how fast but on the "*how-good-can-it-be-made*" principle. This takes time. But it's the only way to *surely* make a roofing absolutely reliable and 100% weather and waterproof. You buy roofing for an investment. But a half-made, "hurry-up" roofing is the worst kind of an investment. You pay almost as much. What do you get? A quick-spoiling roof—a roof that's only half a roof—a roof that is a constant nuisance and source of expense. NEPONSET Roofing is slowly made—to give a service of years—not merely to sell.

Sold by dealers everywhere. Write for name of nearest dealer.

Her Cough Racked Her Terribly.

DR. WOOD'S NORWAY PINE SYRUP Effected A Cure.

Obstinate coughs and colds yield to the greatful, soothing and healing power of Dr. Wood's Norway Pine Syrup, and for the racking, persistent cough, often present in consumptive cases, it will be found exceedingly beneficial and pleasant to take. The use of it is generally indicated wherever symptoms of throat, or lung troubles appear, but especially so with all persons of a consumptive or catarrhal tendency, as its prompt curative properites speedily remove the danger, and restore the throat and lungs to a sound healthy state if used in time.

Mrs. Edward Patterson, Young's Cove Road, N.B., writes:—"I have had occasion to use Dr. Wood's Norway Pine Syrup, and can say that it is certainly a good medicine. About a year ago I contracted a severe cold which settled on my lungs, and left them in a very weak state. The cough racked me terribly, and I was in despair until a friend advised me to give Dr. Wood's Norway Pine Syrup a trial. I got a bottle, and before I had it half gone I found relief. I used two bottles, and have never been bothered since. I would not be without it in the house."

Price, 25c.; family size, 50c. Manufactured only by The T. Milburn Co. Limited, Toronto, Ont.

the bees have of dividing up, and a part of the colony going out in search for a new home. There are a great many "causes" of swarming; and sometimes bees will swarm without any apparent cause. The old saw, "an ounce of p revention, etc.," is most true in the case of swarming. It is very hard to stop a colony of bees from swarming, once they have got the impulse to do so, but by providing plenty of empty combs, particularly for the queen to lay in; by providing plenty of ventilation and shade for the hive; and by the removal of drone comb, the number of natural swarms can be greatly reduced. There are a number of artificial preventatives, which are more or less effective in preventing and retarding the swarming fever. ...

Summer Management.—Early summer management consists of keeping a lookout for swarms and adding supers. If there is to be a fall flow of dark honey, then all clover or light honey should be removed from the supers before any of this comes in.

If you have been keeping a close watch on the work of each queen, you will know which are beginning to show signs of weakening. Such queens should be replaced by young, vigorous queens, as soon as the heavy honey flow is over. Young queens will fill the hive with vigorous, young bees for going into winter quarters, it is useless to put old, worked out bees into the cellar for winter.

Fall Care.—When the fall honey flow is over and there is practically all supers may be removed. Gobd bee-keepers follow the plan of feeding no more honey to be gathered, then the colony all the stores it will take, just after the last honey is removed, say about the end of September. After being fed, the bees are ready for winter quarters.

Wintering—Taking everything into consideration in this province, the cellar is probably the best winter quarters for bees.

Preparing the Cellar to Receive the Bees.—The preparation of the cellar will depend, to some extent, on the number of colonies to be placed in it. The portion devoted to the bees should be partitioned off from the remainder of the cellar, especially if it is a root cellar. The hives should be placed on racks, the bottom tier not less than one foor from the floor of the cellar.

The best cellar will be fairly dry; capable of being kept at a uniform temperature, 40 to 50 degrees F.; well ventilated; dark and quiet.

When to Bring the Bees In—While weather conditions will influence the time, yet in this province, between the 15th and 20th of November seems nearest correct. It is better to have the bees in a little early than to take them in after they have been subjected to a severe cold spell.

Preparation of the Hive.—While some have fairly good results by leaving the hives with bottomboard and cover on, just as they are on the summer stand, yet most good bee-keepers consider it advisable to remove the cover and put in its place something like old burlap or a cushion of planer shavings or buckwheat hulls or chaff to absorb the moisture which is the result of the breathing of the bees. It is also considered advisable to increase the ventilation of the hive by raising it from the bottom-board, at the back, and placing a bit of lath between hive and bottom-board at each corner.

Outdoor Wintering.—In many parts of Ontario, where the temperature falls as low as it does anywhere in this province, outdoor wintering is being practiced with considerable success. In some cases, single hives are enclosed in an outer box and leaves, planer shavings, buckwheat hulls or

A handy pump for farmers

It is a direct lift pump that can be attached to wind mills, a Fairbanks-Morse Eclipse Engine, or operated by hand.

This is one of the least expensive and most efficient of our high grade farm pumps.

Adapted for lifts from 30 to 125 feet. Altogether an ideal pump for any farm—easy to operate—will keep in good repair for years.

Send for free catalogue of pumps and water systems. If you are interested in farm engines, spraying outfits, lighting systems, power and hand tools, scales or mechanical goods of any kind, full particulars will be sent to you on request. Address Dept. 44

The Maritime Farmer one year and one of our vest pocket lights complete for $1.25 (Light sells everywhere for $1.80).

We have other valuable flash light premiums which we will gladly furnish on application. We can supply them at about half-price, with the Maritime Farmer.

We have secured the agency for the Maritime Provinces for a leading house and can thus supply these premiums at these wonderfully low prices.

If interested write us.

The Maritime Farmer, Sussex, :: New Brunswick

some other absorbent material is this province, outdoor wintering, packed between the hives and the outer wall.

Another practice is that where four hives are arranged in a group close together, with back ends together and entrances of each pair in opposite directions. In this position, they are packed as the single hive is. Each method has its advantage and disadvantages.

The most essential thing in handling bees, is to do the right thing just at the right time. No amount of subsequent good care will result in a crop of honey, if the bees have been allowed to suffer neglect at an earlier stage in the game.

Address by H. B. Durost, before the Short Course Students at the Fisher Vocational School, Woodstock, N. B., March, 1914.

Scotsburn Creamery Co., Ltd., in Annual Session.

Tne Annual general meeting of the Scotsburn Creamery Company, Limited, was held at Scotsburn, on Tuesday, March 10. President D. W. Murray in the chair.

The Directors' Report, presented by the President, was most encouraging. During the year, $55,305 was paid for cream as compared with $44,788 in 1912 and $36,181 in 1911. Many new improvements were added during the year and a practically new system of bookkeeping adopted; the work all better systematized and now managed entirely by local men, under the able management of Mr. Robt. T. Stewart. The system of co-operation in the handling of eggs was not yet perfected but it was expected it would be shortly. About 6,000 dozen were handled during the year. The quality of eggs was pronounced excellent and many complimentary letters were produced from the buyers.

The Secy-Treas., R. T. Stewart, in his Annual Report, showed a turnover during the year of $73,240.79. Paid for Cream $55,305.06; Eggs, $1217.29; Feed, $7809.27.

The usual dividend was paid and a nice sum set aside for contingencies These accounts were all vouched for by the Auditor, B. Gravestock, C. A.

The retiring Directors were re-elected, making the Board the same as in former years.

The Company will not handle feed during the coming year, this branch of the business being handed over to the new Co-operative Trading Company established last year.

W. A. MacKay, Dairy Superintendent, was present and gave a short talk on the Development of Co-operative Dairying in the Province, and of the necessity of greater development along productive lines.

The meeting was perhaps the most enthusiastic ever held by this strong Co-operative Company. All the reports were well received. The business is now on a splendid paying basis as a co-operative concern and the great principles of co-operation are getting more firmly imbedded in the district yearly.

We need many more of just such concerns in the Maritime Provinces.

I believe in Horace Fletcher, Dr. Dewey and Joseph Wallace. Some of all, and all of some, and the substance of these is this: Mastication is the thief of time; but he is an honest rogue, for he returns his plunder with interest. The wise man is he who, in the matter of food, first choose it, then chew it. Bolt your food, and you bolt a door—against health. A soft answer turneth away wrath, but soft food turneth little Mary. Hard food and hard work lead to easy old age.

MONCTON, N. B.

SHORTHORN CATTLE

Stock bull, Doune Gladiator, (imp.) 79308. No superior in Maritime Provinces.
Also choice lot of heifers, best blood of the breed obtainable, with size, style and quality. Also a few high class milking grades.
Prices within reach of any farmer who wishes to improve or renew his stock.

J. E. Hetherington,
Cody's N. B.

EGGS FOR HATCHING

Buff Orpingtons, $1.50 per 15.
White Wyandottes, $1.50 per 15.
Siciallian Buttercups, $2.00 per 15.
Get your order in early.

HIGHLAND VIEW DAIRY,
R. R. BLACK, - Amherst, N. S.

FOR SALE

A handsome Grey African Gander, a high class bird and perfect in every way. Am only selling because he lost his mate by an accident. $6.00 if taken at once.

SARAH E. MOSES SMITH,
Woodward's Cove, Car. Co., N. B.

BARRED PLYMOUTH ROCK EGGS

We are now offering eggs from pens of select birds at $3.00 per sitting of 15 eggs; from pure bred utility pens $1.50 per 15. Prices given on application for larger quantities.

CRAIG BROS.,
Amherst, N. S.

Chester White Pigs For Sale

Book your orders now for Chester White Pigs from four weeks upward. Pairs furnished that are not akin.

W. A. ERB, SUSSEX, N. B.

"Homestead Farm"

Holstein-Friesian Cattle
Clydesdale Horses
Shropshire Sheep
Berkshire Pigs

We have for sale at present a few young bulls fit for service, and some heifers of different ages also some young cows.
If you want to get into an A1 Clydesdale Stallion in a year or two, now, is your chance. We have a yearling that will make them all go. Write for price. Our first litter of Berks is due in April.
Let us know what you want and we will give description and price, or better come and see our stock.

Long Distance 'Phone.

LOGAN BROS., Amherst, N. S.

JOHN RICHARDS,

Bideford, P. E. Island,

Breeder and Importer of

Clydesdale horses of the highest quality and breeding—the stud includes the noted show and breeding horse "Baron Kelvin." Every brood mare is a first prize winner at Scotch and Canadian shows. Driving horses generally on hand. Shetland ponies of the smallest type and best breeding. Polled Angus cattle of the most fashionable strains. Herd won first prize Toronto in 1906 and many other shows. Also small herd of Shorthorns from imported deep milking families.

Are You Keeping Poultry for Profit or Pleasure?

We Can Suit You Either Way

FOR PROFIT

We offer eggs for hatching from Birds bought from The World's Champion Layers

Tom Barron's S. C. White Leghorns—Winners at the leading Egg Laying Contests in England and America. Every hen guaranteed off 260 egg strain and the Cocks full Brothers to the hen that laid 282 eggs at Storrs. Conn. last fall.

J. W. Park's Barred Plymouth Rocks—The World famous 200 Egg Strain. We hold Records and Guarantee for every bird purchased.

With eggs selling at 60 cents a dozen and the above Stock all **Guaranteed** well over the 200 egg per year limit just figure out the **Profit you can earn** by keeping stock of this quality. One hen of this standard equal to three scrubs is a modest estimate.

FOR PLEASURE

Exhibition with heavy egg laying qualities combined

We offer eggs for hatching from birds bought from **The King of S. C. White Leghorn Breeders, George B. Ferris.** Winner at all the leading Shows in America. His latest record 35 First Prizes, 41 Second Prizes at 13 Shows.

E. B. Thompson's Imperial Ringlet Barred Plymouth Rocks—The Best and most popular Strain of Barred Rocks in the World. See our Poultry Pamphlet for particulars of the winnings of this strain at Madison Square and other leading shows this winter.

Regardless of cost **we have bought the best stock** that money could buy. The best was not too good for us, the best is not too good for you. We have **the goods** and guarantee you a square deal. Our price is consistent with the quality offered as we are only charging about **one half** of what youwould have to pay if you bought direct from the Breeders of our Stock birds and you get the eggs practically at your own door.

Send for our Poultry Pamphlet giving full particulars of breeding stock.

The Fertilizer Experimental Farm, Ltd.
SYDNEY, - - NOVA SCOTIA

SCOTCH COLLIE PUPPIES

We have some fine Scotch Collie Puppies for sale, the puppies are from the finest stock in Canada both sire and Dam being prize winners at the recent dog show at St. John, N. B. as well as other big shows in Upper Canada. These Puppies are finely marked, dark in color and should make very fine dogs. Write for prices, pedigree and full particulars.

Kingsdale Poultry & Supply Co.
SUSSEX, N. B.

Maple Forest Yorkshires

We have the type that gives best profit. Write your wants to

S. J. GOODLIFFE, - Sussex, N. B.

WISH-TON-WISH STOCK FARM

Breeders of High Class Holstein-Friesian Cattle and Berkshire Pigs

A few good young cows that have freshened and bull and heifer Calves for sale, sired by Schuiling Sir Posch, twice grand champion Holstein bull at the Canadian National Exhibition at Toronto; also some sired by Sir Mercena LaForit Lad, who won first prize wherever shown. Can spare a good Berk sow or two ready to breed. We are also booking orders for young pigs for spring delivery.

HARDING BROS., Proprietors, WELSFORD, New Brunswick.

AYRSHIRE CATTLE AND CHESTER SWINE.

I am offering the following for sale:—One two-year old Ayrshire bull out of the famous cow White Heather, several choice bull and heifer calves and a few good cows.
Chester White Swine—Orders booked for spring litters.
Several choice Barred Plymouth Rock Cockerels. Correspondence solicited. 'Pone 111.

Some Practical Suggestions on Soil Cultivation

Address by W. W. Baird, Supt. Dominion Experimental Station, Nappan, N. S., Before the Nova Scotia Farmers' Association and the New Brunswick Farmers' and Dairymen's Association at Their Recent Annual Meetings

Mr. Chairman and delegates it gives me a great deal of pleasure to attend this convention to meet and exchange ideas with you.

I also esteem it an honor to have the opportunity of discussing with you for a short time the subject of Soil Management, which is to my mind of very great importance to us as farmers, if we expect to attain a high standard of pronciency in our agricultural pursuits and which is one of the means of success in farming if properly considered.

We cannot, however, in the short time at our disposal, go into the subject very fully. We must, therefore, confine ourselves to the more important factors underlying soil management.

It has been rightly said that all nature is variable but few things in it are more variable than the soil covering the globe. Therefore, the first step for us to take is a study of of the various types of soil and to learn as much as possible of their peculiarities and requirements in order that we may be able to handle them to the best advantage.

Soils are not, in a very large measure, controlable; we must take the soil as we find it on our farms. We may have at the outstart the privilege of selecting our land but once settled we are compelled, so to speak, to do the best we can with it. Hence the phase of the subject is almost most a negligable quantity, except in so far as the methods which are to follow should suit the land under cultivation.

Generally speaking and for most purposes, we can classify the different kinds of soil as follows: coarse gravelly, fine sand, light loam, medium loam, heavy loam, clay, hard pan and black muck. I take it that this includes pretty nearly the whole range of soils we have in the Maritime Provinces. Fortunately or unfortunately we find these varieties all on the same farm.

We know that the soil is formed by the disintregation of rock or rock particles, caused by the action of heat, water, frost, corrosion and weathering of all kinds. Hence we say that most soils are made up of rock particles of various kinds, but associated with these are varying amounts of organic matter derived from vegetable matter or plane tissue in the six different classes of soil varying in equality according to the percentage of the small or large rock particles. They contain also humus, which is the decayed vegetable matter. For example, if a soil contains 90 per cent of very minute rock particles and very little humus or no humus it would be termed gravelly. If it should contain an equal amount of either and a goodly amount of humus, we would term it loam. Further, one that contains a large percentage of vegetable matter is termed black loam. Hence the gradation of our soils.

Minnie and Major

Fowler Bros'. Grade Clydesdale Team, that figured so extensively in the winnings at the 1913 and 1914 Maritime Horse Shows, Amherst, N. S. These horses were sired by Prince of Annick.

From the aforegoing it is quite evident that the methods of soil culture must vary with the various types of soils, if we wish to realize the most out of them. For instance, the same methods of handling clay soil would not be suitable for sandy soil. Why? Because in one case the object should be to make the sandy soil more retentive of moisture and fertilizer for the immediate use of the crop. Whereas, in the case of clay soil, the object should be to render it more open and thereby more suitable for plant growth. Further, the latter soil may be fertilized for several crops without the danger of much loss occurring from leaching. Thus the question arises as to how we can handle the different soils to the best advantage. This must necessarily be determined to a great extent by "the man on the spot."

In other words, under our varied conditions, a set of hard, fast rules, suitable for farmers, cannot be worked out to our advantage. On the prairie lands which are fairly uniform this may be done in a measure. In the West, they have large tracts of land similar in character and generally speaking conditions are similar and the climate is also not so changeable as ours, all of which goes to make it desirable to follow certain rules in regard to the handling of their crops, at least, over a larger area than we can in the Maritime Provinces where our climatic and soil conditions vary so. There are, however, soil management principles familiar to all of you. For instance, you are all agreed that to incorporate manure with soil thoroughly will give better results than to do otherwise. For example, take the vegetable grower, he goes in for intensive farming so to speak, and he wants to make just as much as possible out of a small area. Hence he finds that to put his manure through a manure spreader, which breaks it up well, and ploughs it in then to incorporate it thoroughly with the soil by repeated cultivation, gives him better results than to spread it on, unevenly and plough it under in lumps. If then these methods pay the vegetable farmers, they would most assuredly pay us. Many farmers try to handle too great an area, more than can be properly fertilized and cultivated. By following the methods of the vegetable farmer we would get better results.

With smaller farms there naturally would be more of them and it would stimulate social life, which would make the country life more attractive for many.

THE USES OF THE SOIL

First, in the agricultural sense the most important use of the soil is as a storehouse for moisture for the use of the plants. The productiveness of any soil is to a great extent determined by the amount it is capable of holding, by the manner in which it is held and by the readiness and completeness with which the plant growing in it is able to withdraw the water for its uses.

Second, a store house from which the plant derives ash ingredients, the lime, potash, phosphoric acid and other materials, all of which are derived from their gradual breaking down of the soil grains.

Third, it is the laboratory in which a great variety of microscopic forms of life are at work during the warm portion of the season, breaking down the dead organic matter of the soil and converting it into nitric acid and other forms of plant food available to the higher plant life.

Fourth, it acts as a medium in which plants may place their roots in such a measure as to enable them to stand erect in the open sunshine and moving air currents.

Fifth, the soil is a means whereby the sunshine is changed into energy available to the needs of organism and roots of plants without which plant life could not exist, for all its movements must originate primarily from the sunshine altered in the soil or plant tissues above the ground.

TREATMENT OF SOILS

Experience has taught us that coarse, gravelly soils are the most difficult ones to handle profitably The only salvation is the addition of humus in considerable quantities. Even then we are not sure of extra good crops being obtained, excepting in the wet season. Fine sand likewise is a soil very difficult to obtain a good crop from, in that it is open and very porous, allowing water to

percolate through it very rapidly. It is then absolutely necessary to have the humus in considerable quantities in order to make it more retentive that it may give up the plant food more readily.

Light loam, on the other hand, is likely to give us best results under average conditions. On this soil we get good crops of clover, excellent crops of roots and corn and a fairly good crop of grain. It being fairly well supplied with humus is capable of holding sufficient moisture for the crops and is yet sufficiently open and porous to allow the excessive soil water to percolate away.

Coming to the clayey soils which are equally as good for giving good crops but are slightly more difficult to handle; though with the addition of manure or green crop ploughed under, this difficulty is overcome to a greater or less extent. Under adverse conditions, the soil which is most difficult of any to handle is a clayey soil. If too dry, it bakes very hard, making it very difficult to get into condition for crop production. It is naturally quite wet and if the season happens to be such it is pretty nearly impossible to work it with any satisfaction. But again, these difficulties can be greatly overcome by drainage and the addition of humus in the form of manure and green crops which will make the soil much more porous and friable.

Of all the varieties of soil the one that questions us the hardest is the black muck or peaty soil in that they are the most difficult to manage. First, it is hard to keep free from weeds; secondly, hard to handle in the spring; thirdly, it is the most difficult of all soils on which to get a catch of grass.

From the foregoing we have gathered some idea of the relative value of the various types of soils. We have also noticed that there are two things that enter into soil management that are essential. They are humus and moisture. Hence there must be certain principles to be followed in order to have these two essentials present in the soil in the right amounts when needed.

Let us first consider humus: As before stated, humus is decayed vegetable matter formed in the soil. It can be produced in various ways, usually by the application of barnyard manure or the ploughing under of green crops. In order to receive the best out of barnyard manure, which is undoubtedly the farmer's best fertilizer, it must be applied in as fine and as uniform a state as possible. In this way it can be ploughed under and with repeated cultivation be more thoroughly mixed with the soil particles. Thus the plant food it contains will be much more readily

A Good Mount

H. W. D. Armstrong, Fredericton, N. B., on his splendid Hackney-Thoroughbred Mare, Empress Champion combination carriage and saddle horse winner of the Col. H. Montgomery-Campbell Cup at the 1914 Maritime Horse Show.

available to the plants' immediate use than if it had been supplied in large lumps and poorly mixed with the soil. Barnyard manure not only adds plant food to the soil but when applied to sandy or gravelly soils improves their texture, making them more retentive to soil moisture. Then, too, the decomposition of manure takes place and heat to a slight extent is produced which makes the condition of the soil more suitable to germ life, and they become more active. We must also remember that the decomposition of manure should be slow, otherwise a great deal of its valuable plant food "Nitrogen" may be lost in the form of ammonia. This is true where it has ready access to air. Hence we will see that in sandy and gravelly soil we are more liable to loss as such soils are more open and porous. There is, too, considerable loss from percolation or washing away of plant food, hence it would seem most advisable not to plough your manure too deep in the soils, nor to add a grat deal more than required for the immediate use of the crops. The physical conditions of such soils will be changed, however, and made more retentive of plant food and moisture as soon as we are able to get a crop such as clover growing in it which send its roots down deeply into the soil and in turn would add humus to a greater depth by the decaying of the roots and thus improve the texture of the soil to such an extent that very little leaching would occur. If we add barnyard manure to the heavier soil, such as heavy loam or clay we find that it makes them more open and porous, more friable and easy to work and put them in better shape for the conservation of moisture. It also aids in good ventilation, all of which facilitates the ready production of available plant food. These types of soil alone retain fertilizer much longer than do the former types owing to less possibility of leaching.

Green crops, ploughed under, have practically the same effect on the various types of soils as has barnyard manure. One would think, however, and rightly so, that such crops as clover are more beneficial in the improvement of soil texture because these crops have a very extensive root system, which penetrates very deeply into the soil and when these roots decay they will supply humus to a greater depth than we can by ploughing in the manure. They will improve the texture of the soil to a greater depth and thereby increase its productive power more than is possible by the application of manure.

We must not forget that it is not always quantity but quality that is needed. That is to say that it is far more profitable to keep adding a little fertility such as barnyard manure or green crops in the form of clovers, especially, if the manure is properly applied and the green crop well ploughed under, than to add large quantities at long intervals. "A little at a time and that done well" is a very good rule.

From what has been said we can readily see that in order to get the various kinds of soil into as nearly a perfect condition as possible for the best plant growth the fertilizing materials should be well mixed with it and the soil must contain a certain amount of moisture and it should be in such quantities that the bacteria or germs which act on the various soil constituents, thus making them available for plant food, will be most active. That is to say the physical condition of the soil must be the best we can make it.

We have gone quite fully into the various types of soil and their physical requirements for productiveness, now we should consider as to what are the plant food requirements.

Officers of the 1914 Maritime Horse Show

Front Row:—Fred Henderson, Judge; W. W. Black, Vice-President for Nova Scotia; Lt. Col. Montgomery-Campbell, President; E. A. Trites, Vice-President for New Brunswick; Dr. J. A. Sinclair, Judge.

Back Row:—R. S. Starr and S. A. Logan, Directors; Frank Power, Superintendent of Arena; Morris Allair Scovil, Director; James F. Roper, Director; F. L. Fuller, Secretary-Manager.

From the composition of plants we can quite safely state that certain substances such as potassium, calcium, magnesium, phosphorous, sulphur, and iron and probably a little chlorine are essentials Further experiments have shown that should any of these be absent the crop will not develop or mature properly. These substances occur in plants as salts, being combined with phosphoric, nitric, sulphuric and various vegetable acids. Sometimes these metals are present as chlorides. Phosphorous occurs as phosphates and sulphur as sulphates and in the ash of plants the basis of nitrates and of salts of vegetable acids are found in the form of carbonates. The above mentioned ingredients of plants are generally termed the incombustible parts while carbon, oxygen, hydrogen and nitrogen are termed the combustible ingredients. Hence the plant is made up of a combination of all these various forms.

Soil analysis generally show these elements to be present, though not always in elementary form, but combined in a great variety of ways not always available for the plants' immediate use, but under favorable conditions plants are able generally to obtain their needed supply. By favorable conditions we mean that there should be plenty of moisture in the soil to aid in dissolving the soluble plant ingredients and to carry it into the roots and on up to the leaf where it is prepared for building up the plant. That there should be plenty of good, pure air circulating through the soil to supply oxygen and nitrogen for the nitre forming germ which acts on the ammonia salts in the soil changing them into nitrates, the latter form being used by the plants, and also carry off the excessive amount of carbon dioxide, which is set free in the soil.

TEMPERATURE OF SOIL.

The temperature of the soil is likewise an important factor. It is known that none of the chemical, physical or biological changes essential to the development of the plant food in the soil and to proper root action of plants can take place in the

Blackmail and Business

The Eastern Farm and Home and Fur Farm Review is evidently after business at any cost. One of the leading and most highly respected breeders of the Maritime Provinces had an experience at the Amherst Horse Show, which suggests that the management of that paper is out on a "your business or your reputation" basis.

The gentleman in question was approached by the manager-editor of Fur Farm Review and asked to subscribe.

The breeder declined and unhesitatingly stated that he was a subscriber to the Maritime Farmer and he proposed to stand by the paper which has served the interests of agriculture in Eastern Canada for twenty years.

The manager-editor of Eastern Farm and Home promptly informed the breeder that his paper would give the breeder's stock a black eye when the fall exhibitions came around.

Blackmail is rather a dangerous weapon. The criminal laws of Canada have provided penitentiaries for those who use it. The little incident above shows particular solicitude for the welfare of farmers.

Apart from the scandalous suggestion that a club is to be used on persons who do not come over with business for Fur Farm Review, the general public can from their own opinion as to where they will come in under the advanced system of forcing grist to the mill.

Apparently the standard of the quality of a breeder's stock is to be the amount of money he is willing to contribute to Fur Farm Review. If he does not "come over," he is to be given a "black eye" as per the threat of the manager-editor of the journal. The man who wants to buy live stock will be placed in this position, provided he accepts, Eastern Farm and Home as his guide: "he may be forced to conclude that the high grade stock of a non-contributor is worthless and that the worthless stock of a business contributor is "high grade."

We make no comment. We will allow the breeders and the general public to draw their own conclusions.

absence of energy stored up in the soil as indicated by its temperature. When the temperature falls below 32 degree F. practically all life processes becomes dormant and for the greater portion of cultivated crops the soil temperature must rise to forty degrees before growth will start. The temperature at which best results are obtained lies between 68 aod 85. Nitrogen forming bacteria will not start action till at least 41 to 45 degrees are reached. Hence we can readily see the importance of heat in the soil.

Generally speaking, these favorable conditions are brought about by good soil cultivation and fertilization, for without the best conditions for plant development, plant food will be wasted or not made proper use of. Here again, we may say that the methods and application must conform to the condition and all details must be worked out by each farmer as will meet his conditions best.

Next we might take up tillage, the chief factors of which are:

First, to destroy and prevent weeds and other undesirable vegetable growth.

Second,to place beneath the earth manure, stubble and other organic matter, where it will readily be converted into humus.

Third, To develop various degrees of openness of texture and uniformity of soil conditions suitable to the planting of seed and the setting of plants.

Fourth, to modify the movement of soil moisture.

Fifth, to change the temperature of the soil.

TWO CLASSES OF TILLAGE

Now, tillage can be divided into two classes, viz., preparation tillage and maintainance tillage.

By preparation tillage is meant the tilling of the land before planting. The heavier and more compact the soils the greater the necessity for thorough and deep cultivation in order to get the manure well mixed with the soil thus making it more porous and open to admit air and enable the plant roots to penetrate deeply and in so doing stand firmer and thus feed from the plant food deeper in the soil. Especially should this be true in growing a crop like potatoes, that send their roots down very deep. Such land must be fairly loose and open to permit the tubers to develop properly. Experience has taught us that they do best on a friable loam, but sometimes we are compelled to grow them on a heavier soil and in such a case you can see the importance of a thorough drainage and proper cultivation of the soil to a good depth before they are planted; because once they are planted we are unable to cultivate tnat soil to an appreciable depth afterwards. This rule holds equally true for all crops but not to so great an extent perhaps for some as for instance a crop such as turnip with its less rangy root system will grow and do well on a much heavier soil than will potatoes and deep cultivation may not be necessary. Though this is true we must not forget that the more thoroughly we cultivate in the preparatory stage the better crop we are likely to get.

The maintainance tillage is the tillage required after the plant or crop has been sown and generally speaking should be shallow, the main object being to destroy noxious weeds and to leave a fine earth covering on the surface of the ground, to prevent evaporation. The younger the plant the deeper can the cultivation be between the plants, gradually getting shallower and narrower between the plants as they develop until there is danger of injuring the root, then stop.

We have only mentioned the heavier soils but we can readily see from what has been said that with the lighter soils the less depth should be cultivated depending of course on conditions.

By cultivating we destroy noxious weeds while they are yet young by turning their tender roots up to the burning heat of the sun. It is the agency through which moisture is conserved in the soil, by breaking up the capillary action and preventing the evaporation of soil water. We are all agreed that soil is made up largely of small rock particles. To illustrate how cultivation conserves moisture suppose you take a marble, dip it in water, and when you take it out it is covered with a thin film of water. All rock particles in the soil are just the same. They all have (when there is sufficient water in the soil and generally speaking there is) a similar film of water around them. Now as they are all touching together at various points, this film of water is more or less continuous and as the heat from the sun dries up the moisture from the top particles, they in turn draw from that neighbor below and so on down, so that if the action continued a great deal of the soil water needed for crop use would soon be lost but by cultivaelon we separate these top particles from their neighbour below, hence for a time they are cut off as it were and they become dried out and as we know from experience these very dry particles of soil will be very slow in making the necessary connection to draw water from their neighbors unless moistened by rain. A good example is the sponge. Take a sponge that is very dry, place it in water. Will it take up water very rapidly at first? No. But moisten that sponge well then squeeze out all the water you can, replace it in water and it will take up water quickly. The same thing is true of soil particles.

Now temperature comes in here and this is where cultivation will improve the temperature of the soil. We know from experiments that it requires a great deal more heat to warm up one pound of water than it does one pound of dry soil. In fact it takes 100 heat units to raise the temperature of 100 lbs. of water one degree, while it only takes 20.86 heat units to raise 100 lbs. of dry humus one degree. Sand 10.08. Loam 14.96 and so on for the other types of soil.

Now if by proper cultivation we cut off the rise of soil water by evaporation and our top few inches of soil, which is used for the seed bed, becomes moderately dry, will not the sun's rays have a greater effect on it than if it contained a lot of water? You know it certainly will. You know a dry land heats up more readily than a wet one. Professor Grisdale, of Ottawa, found a difference of from 4 to 5 degrees in one to one and a half days. While this does not seem very great, it is nevertheless of a very great importance to us at seeding time. As before stated it requires a temperature of over 50 degrees to get good germination and good germination means a more vigorous growth.

It has also been found that to roll land first, then harrow, that the temperature of the first one and a half inches of soil was raised 10 degrees as against the adjacent land not rolled, also to a depth of three inches a difference of 6.5 degrees. This is certainly of value to know.

VALUE OF DRAINAGE

Further by thorough cultivation, we open up the soil and allow a more free circulation of the air, which is essential in the soil. Here, too, drainage will come in as a very important part of soil cultivation. Take for instance water-logged soil. The water there has become stagnant The plant germs soon use up all the oxygen contained in it. The rate at which the oxygen from the pure air above the soil can make its way down through the stagnant soil water is all too slow for the use of plants and germs living therein. The fact also remains that the nitrogen forming bacteria are able to do their work properly hence we can readily see the need of drainage for such soils. In fact this holds true of any soils that contain an excessive amount of water and we must assuredly have lots of these in the Maritime Provinces.

Experiments go to prove that in order to get profitable returns for our time and labor that it will pay to underdrain artificially such lands as black muck, loam and clay.

By underdraining we are able to work our lands a great deal earlier in the season. That alone means a great deal, for it is an old saying "a day in spring means a week in the fall." Now a season like that just passed that would have meant thousands of dollars to the farmers of the Maritime Provinces alone. We, at Nappan, were able to get practically all our grain harvested and stored before the wet spell came on, where-

SOMETHING ABOUT OURSELVES

It has never been the policy of the Maritime Farmer or its editors to do a great deal of horn tooting. Their policy has rather been the reverse. They have pinned their faith on the old, yet ever new, adage "By their deeds ye shall know them." In this issue we are going to digress a little

As editors of the Maritime Farmer we have striven to give the best that is in us, so far as lay within our means and power in giving to our clientile a clean paper, keeping closely in touch with agricultural conditions in the Maritime Provinces.

That our efforts have been and are appreciated is vouched for by the fact that over 11,000 of the most progressive and intelligent farmers of Prince Edward Island, Nova Scotia, and New Brunswick are enrolled on our subscription lists. Many of these have been constant subscribers ever since the Farmer was brought into existence, nearly twenty years ago.

The expressions of good will and appreciation that reach us in nearly every mail are most cheering and an incentive to put forth special efforts to still further our usefulness to our readers.

But our readers are not the only satisfied clientile we have Advertisers who use the columns of the Maritime Farmer have no hesitation in announcing that, without an excepeion, it is the best advertising medium in the Maritime Provinces, when the object is to bring their wants and wares to the attention of agriculturists. We have numerous letters on our files that bear testimony to the good results that our advertising patrons are receiving.

Among our present day advertising patrons are business firms, who have not missed a single chance to use our columns since we made our first bow to the public twenty years ago.

Despite the fact that we have received a fair share of the support of the farmers of Maritime Canada, it has not always been "just plain sailing" for the Maritime Farmer. It has taken years of hard work and a lot af cash to acquire the position of confidence we now hold.

We have followed the policy of giving an accurate report of exhibitions fairs, etc., without fear or favor. We have done so, although on more than one occasion we have been approached by an unscrupulous breeder with the request that his stock be given an undue boost to the detriment of some one else's, who may have stood a little higher in the winnings. Needless to say the same request never came twice from the same party as he was given to understand in no uncertain terms that the editors of The Maritime Farmer did not sail their ships in such turbid waters. We are pleased to give the small exhibitor as prominent a place as the large exhibitor, if his goods warrant it and the advertiser does not get any more publicity than the non-advertiser unless his stock warrants special mention. The Maritime Farmer's opinions are not bought and sold, and the men responsible for them have some standing in the community in which they live, as well as among the men who are doing things agriculturally in Canada.

BALANCING THE ROTATION

In arranging a rotation to meet the needs of a general farm it may be well for the manager to have four objects in view when the crops are planted—cash, food, feed and fertility. It is well to remember also that these objects bear a close relation to each other, that the one should supplement the other. Where a large portion of the farm is planted in orchards or potatoes and the acres in feed reduced, it means that feed must be bought and that the manager of the farm must pay the expense of producing the feed crops, the cost of marketing and, in addition, a profit to the producer. If the crop designed for cash income be allowed to reduce the fruits, vegetables, swine, cows, sheep and other crops and animals for food, the manager must buy these products with the cash crop and pay a profit above the cost of production.

To buy products for food, feed or for fertilizing the soil when these can be raised on the farm is an economic loss' unless the cash crop afford a profit large enongh to cover the cost of marketing the other products. The same objection could be raised to planting too large acreage in feed crops or food crops.

By planning the rotation wisely the crops may be distributed in correlation with the livestock so that each will supplement the other, so there will be little loss of time in cultivation and harvesting and so the waste of time and equipment required to market the crops will be reduced to a minimum. Food for the manager and his family should be produced, so far as is economical; feed must be produced to supply the animals; the fertility of the soil for future crops must be provided in cover crops, legumes and other changes in the rotation.

The equipment, such as men, teams, implements, etc., must be used in such a manner that there will be a profit upon the investment and a salary for the manager. All of this need not be expected in cash at the end of the year, as a portion of it may be in young animals, reserve feed or surplus food, all of which may be converted into cash should it be necessary. The increased fertility will also be an asset, as it will bring in greater income in larger crops, which means less expense in production.

DIVERSIFY FOR SAFETY

Intelligent diversification of crops is the safest practice unless one be especially well prepared to specialize. Specialization is desirable in most lines of business, put in farming it is not always safe for the average farmer. For the specialists in farming it is desirable; the average man on a general farm will find diversification safer and more profitable when results for a number of years are compared.

But diversification for a variety only is not desirable. In the system of rotation every crop produced and every animal raised should correlate with every other crop and animals in such a way that the plan of farm management utilizes the equipment to its highest efficiency. The plan must be arranged so that the capital invested and the labor performed will bring in profits not only upon the investment, but a salary for the manager.

Intelligent diversification is economical in that it utilizes the equipment to the fullest extent;it furnishes employment for men and teams and produces feed, food and fertility crops with one or more crops for cash income. This is safe farming and it is best for those not situated favorably for specialization.

THE SPIRIT OF ARBOR DAY

Should not the Arbor Day spirit reach much farther than the setting out of a few trees and shubbery? Could it not also be profitably set aside as a clean-up day for the country villages, churches and schoolhouses? There are the signs of every kind on beautiful trees, on fences, on stables and other small puildings which have been placed there without permission of the owner and with no thought as to appearance, that might be removed. Rubbish of all hinds, ash piles, exposed manure, dead branches of trees and much other unsightly trash that has accumulated during the winter can be cleaned up. It is such things as these that mar the beauty already created by trees. Although Arbor Day is set aside for the planting of trees and protection of birds, its significance would be greatly increased if the community is also beautified by cleaning it up.

ADAPTATION OF LEGUMES

The many advantages in growing the various legumes such as peas, beans, clover, alfalfa, vetch, etc. should be apparent to all who have given serious consideration to the relative merits of crops grown on our farms. When we enumerate the various purposes for which crops are grown we are apt to decide that the legumes such as are adapted to our conditions in the Maritime Provinces should be grown more extensively. These crops are needed in nature's plan of restoring worn soils and conserving food to make the earth maintain our rapidly increasing population. They are the one type of plants, so far as our present knowledge is able to determine, that make land richer in nitrogen under certain conditions after producing the crop.

It is an interesting story familiar to those who have studied plant life of the relation between plants of tee legume family and certain soil organisms by which the plants furnish a home free of rent and receive in return free nitrogen on their roots in the form of nodules. This phenomenon has a direct bearing upon human life and human happiness, because it provides a way to restore our worn soils in nitrogen without expensive fertilization and makes it possible for soil improvement by judicious crop rotation.

In feeding livestock the plants of the leguminous family are very valuable, because they are rich in feeding nutrients, especially protein, which is an expensive constituent when it must be bought in feed. Most of these legumes are exceptionally palatable to stock; they mature quickly as a rule; endure thin soil; stand drouth and are not, as a rule suseptible to insect attacks and disease ravages.

It seems to have been designed in the economy of nature that the soil should produce both legumes and non-legumes and that the one should follow the other in succession.

TIMELY WORK WELL DONE

Everyone must have noticed at the races usually held at the fairs how extremely important it is for a horse to get an even start in the race. With only a few inches behind in the start the horse is greatly handicapped in winning the race.

This is descriptive of the planter who must for any reason get behind with the preparation of the seedbed and the planting of early crops. His increased energy must go, not in taking advantage of his work and doing it better, but in gettiug over the field in any manner. This means poor preparation and planting under unfavorable conditions, which may never be overcome in a satisfactory manner.

There is no other occupation of which we have knowledge that diligence and determination count for more than in farming. Half-hearted work or work done in a hurry may and generally does cost the manager dearly. The seasons are uncertain and he can never be sure that his honest, earnest endeavor will be rewarded amply, but he can depend upon paying the penalty for neglect and for rush and hurry in field work.

Do what we may, we sometimes get behind with our work and find to our sorrow that we are late with planting, cultivating, harvesting, etc. We can never tell what will be the condition of the weather and that is an important reason why we should look for the worse and get ready for the best.

PLANTING HOME GROUNDS.

The casual observer in passing through the country may not make a close comparison of costly and pretentious homes with the modest building and the cabin, but his attention will more than likely be attracted by the planting of the home grounds. Stately shade trees, attractive shrubs and showy flowers will be admired and they will cover many defects that might otherwise be apparent in the home itself.

A little time and small expense can be no better employed in improving the home than in planting the home grounds. A few trees properly set in ihe yard, a few shrubs rightly located, and a few flowers carefully cared for will increase the value of your farm and make farm life more attractive. If you have ever seriously considered selling the farm, plant trees, shrubs and flowers and these will either sell the farm or they will make the price prohibitory to the buyer.

POWDERY SCAB OF THE POTATO

This disease has been known in parts of Europe for more than half a century. It has been studied by a number of different men and has had a number of different names. It was first recognized as a serious enemy of the potato when it appeared in Ireland about twenty years ago. Within the last few years it has reached Canada and is now found in a number of districts in New Brunswick.

The fungus causing Powdery Scab belongs to one of the lowest groups of organisms, the Myxomycetes or Slime fungi, the lowest group considered by the botanist and one that is very near the dividing line between the vegetable and animal kingdoms. The distinctive characteristics of the memebers of this group are the production of amoeboid cells or masses of naked protoplasm composed of numerous unwalled units. These commonly develop inside the vegetative cells of the host plant as small foreign bodies, differing in this way from nearly all other kinds of fungi that produce a regular mycelium or root-like growth that attacks the cells from the outside. The growth of these foreign bodies inside the cells of the host plant causes the production of the abnormal forms or deformities, such as are seen in the club-root, of cabbage, the most common example of a disease caused by a fungus of this group. The particular fungus causing Powdery Scab in the potato closely follows this habit by producing in its bad stages gnarled and misshapen tubers showing large sores and areas of corky tissue.

APPEARANCE OF POWDERY SCAB.

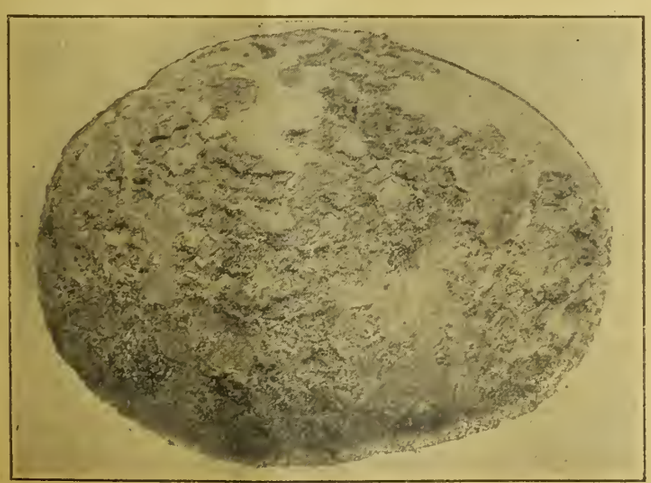
The most characteristic feature of the disease in its mild form is the production of scab spots on the surface of the tuber. These first appear as small pimples on the skin of the potato, later on they burst up through the skin and appear as dark, raised sori exposing a mass of olive-black spore balls within. These spots vary in size, but are usually about one-eighth inch in diameter and either raised or depressed. If unrubbed, they appear as dark, raised sori, with the skin at the edges turned back exposing the mass of spore balls. When rubbed, the raised portions of these sori crumble into a mass of what appears to be dust. This leaves the spot as a slight depression in the skin of the potato (a stage that it is very easy to overlook). Each little grain of the dust-like powder rubbed off is a "spore ball," and is composed of numerous spores bound together into a sponge-like mass. These soore balls spread the disease from field to field and from farm to farm and remain in the soil where a diseased crop has been grown, as a source of infection for succeeding crops.

If the attack is a mild one, it only amounts to anumber of scab spots on the skin of the potato. These render the tuber unsightly, but do not injure it for food. Unfortunately, however, the disease often reaches a more severe stage and causes the formation of open sores and misshapen tubers that are unsaleable and almost unfit for table use. A still worse feature about the disease is that the soil where an affected crop has been grown is sure to be infected with the spores of the fungus and any crop of potatoes grown on the same field within ten years is liable to become affected.

HOW POWDERY SCAB MAY BE DISTINGUISHED FROM COMMON SCAB.

Powdery Scab spots are small in size, raised and dark in color. The skin of the tuber is nearly always turned back at the edge of the spot. If the potato is washed and allowed to dry slowly in the air the scab spots become nearly black in a few minutes.

Common Scab spots are usually from one-quarter to one-half inch in diameter, are flat or sunken and have a granular appearance. When washed they become lighter in color and when allowed to dry in the air are a light brown or mud color.



Ordinary or Common Potato Scab.

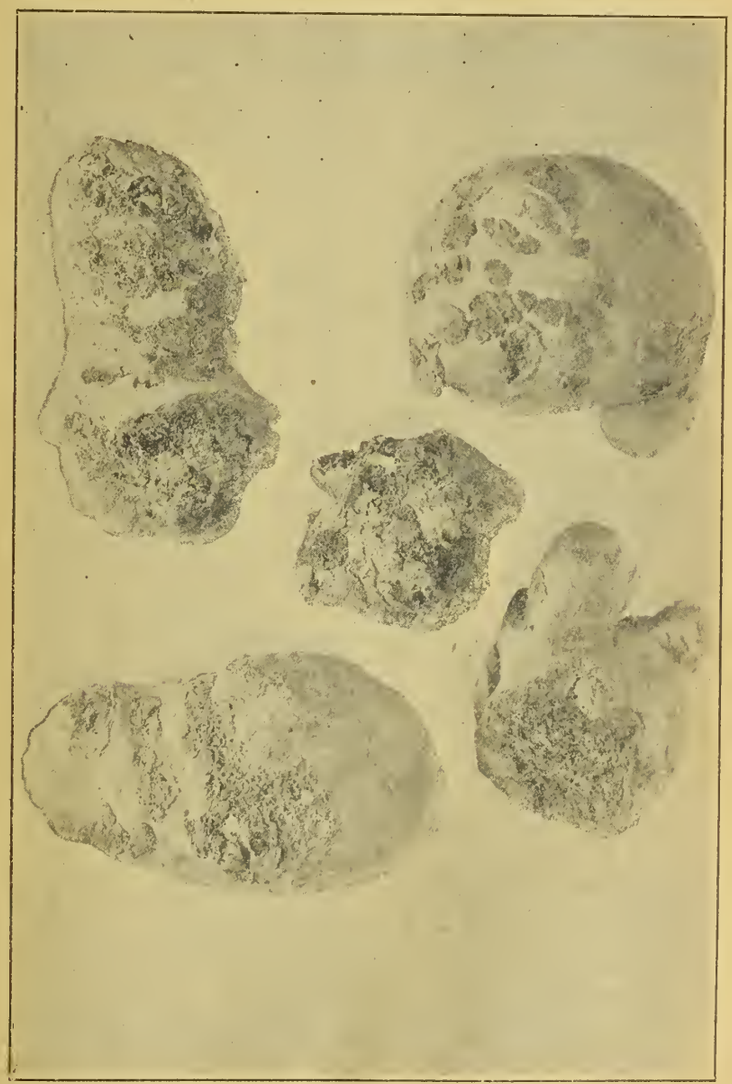
MEANS OF SPREADING.

Inspection work in the Province brought to notice several districts where the use of a hired potato planter on a number of farms appeared to be responsible for the spread of the disease. In one district over twenty farms along one road showed more or less infection, not generally amounting to more than two or three per cent. One farm was found where nearly seventy per cent. of the potatoes showed Powdery Scab spots. A hired planter has been used for two years on this farm and on all the others where the disease was found. This seemed to point to the badly infested farm as having been the seed ground from which the disease spread to the others. It was further learned that, as all were growing the same variety of potatoes, it was a common practice when planting was finished on one farm, to carry whatever seed was left in the hopper of the machine on to the next farm. To emphasize more strongly the spread of the disease in this way, three farms were found in the midst of the infected area where a private planter had been used. This planter had never been used on other than the three farms or with other than the seed grown on those farms. No scab spots were found on the potatoes on these farms.

Several cases were found where the infection could be traced back to the purchase of seed from a farm where the disease was present or from a district where the disease was known to be prevalent.

Several cases were traced to a possible source in the use of old potato bags sent out from potato warehouses where diseased potatoes had been handled. These bags were sent to the farms and used to "bag-up" the potatoes in the cellars, giving a good chance for the spores to be shaken off the bags uoon the potatoes intended for seed.

An examination of the scraps being obtained by a farmer from a city hotel for pig feed revealed numerous Powdery Scab sori on the potato peelings, a possible cause of any infection that may appear on that farm.



Powdery Scab of Potatoes, showing the advanced stages of this disease.

One outbreak in an isolated district was traced to a possible source through the young men helping in the potato harvest in infected districts and carrying back to their homes large specimens or specimens of new varieties for seed.

A number of packages of diseased potatoes were found at exhibitions and seed fairs. These were placed beside numbers of packages, and visitors would pick up and handle both the diseased and the clean tubers sometimes putting them back into the wrong packages. If the potatoes exhibited were sold for seed or taken back to the farm for seed they would constitute a possible source of infection.

Some of the important features about the disease may be summarized as follows:

1. The disease in its mild stages causes unsightly scab spots on the skin of the potato.

2. In the severe stages the disease causes the production of deformed and sori-bearing potatoes that are practically unsaleable.

3. The spores of the disease remain virile in the soil for at least nine or ten years and will start an infection in crops of potatoes on the land within that time.

4. The disease once established in one field is spread by succeeding potato crops to other fields until the whole farm becomes infected.

5. The presence of the disease in the soil of any farm depreciates the value of that farm for any system of agriculture that involves the growing of potatoes.

6. The presence of the disease on one or two farms in a district depreciates the value of all the other farms in that district for the growing of export potatoes or seed potatoes.

WHAT TO DO IF YOU HAVE POWDERY SCAB ON YOUR POTATOES.

1st. Get rid of all the potatoes you have. There is no chemical remedy for Powdery Scab.

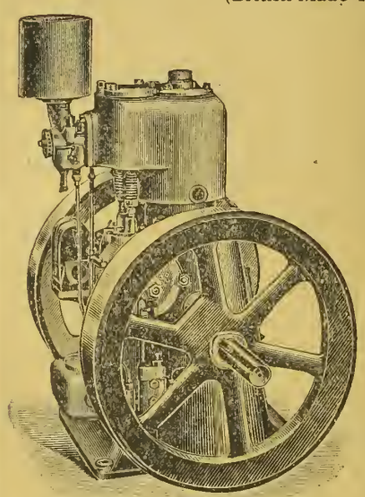
2nd. Obtain seed from a farm where you are sure the disease has not appeared; if possible, from a district where it has not been found.

3rd. Handle the seed potatoes in barrels, bags or baskets that have not been used for potatoes before.

In the centre is Common Scab o Potatoes; right and left show Powdery Scab in early stages.

DON'T take our word only, but examine the Lister Engine at work alongside any other, compare its quality, efficiency, economy—In a word, let the engine speak for itself and you will become another delighted user of

THE LISTER
GASOLINE ENGINE
(British Made Throughout)



The most reliable, best quality and value.

Starts instantly — every time, with Bosch Magneto ignition—no batteries to run down and give trouble.

Self-oiling, no oil cups to fill—no oil to waste.

Self-regulating at all loads. No attention needed when at work.

Fitted with phosphor-bronze bearings throughout, the best money can buy.

No babbit metal to wear and run out.

In a word, the best quality engine ever seen in Canada

We have sold over 50,000 Melotte Cream Separators in Canada during 15 years. Ask any Canadian user how he likes the Melotte.

Well—**we guarantee** the Lister as good an engine as the Melotte is a cream separator. We can't say more.

R. A. LISTER & CO., LTD.

58-60 Stewart St. TORONTO, ONT. 82 Water St. ST. JOHN, N. B. 197 Princess St., WINNIPEG, MAN.

4th. Plant the clean seed on land that has not grown a crop of potatoes for two years. Use clean implements.

5th. Clean your cellar thoroughly. Clean out and burn all rubbish. Whitewash the walls and ceiling and spray the bins and floor with a strong copper sulphate solution, 5 lbs. copper sulphate to 25 gallons of water.

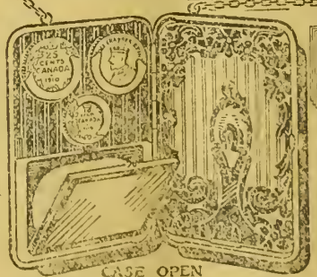
6. Use the fields where the diseased potatoes were grown for other crops, preferably a crop that you will not need to cultivate with the same implements you use on your potato field.

WHAT NOT TO DO IF YOU HAVE POWDERY SCAB ON YOUR POTATOES.

1st. Do not plant any seed potatoes from your own stock. Even though the tubers appear clean they may carry spores of the disease

FREE This handsome Vanity Case and a set of your personal Calling Cards

— A PERFECT COMBINATION — VANITY CASE, COIN PURSE & CARD CASE



CASE OPEN

Mrs John Brown
Brantford

LADIES and GIRLS! Here's the very thing you have been looking for and admiring in the jewelry stores and thought you couldn't afford to own. We have changed all that and are placing within your reach the most useful as well as the most attractive vanity case ever offered, and 25 of your own personal calling cards as well.

LOOK AT THE ILLUSTRATIONS and note the different advantages this handsome combination case shows. The outside of the case is beautifully engraved just as the illustration shows. Inside you have spaces for quantities of coins, the three sizes, quarters, dimes and nickels. Below this is a first class mirror which opens downward revealing a dainty powder puff behind it and plenty of space for a week's supply of powder. Opposite these is the card case where your calling cards are held in place by a gentle spring clip, or you can carry a handkerchief or many other necessities. These beautiful vanities are of the latest design, having all the appearance of the most expensive sterling silver cases that sell for $25.00 and more. They will give years of service and satisfaction, and we give you free with every case 25 fine English calling cards bearing your name and address and day put them if you wish.

HOW TO GET THEM FREE—Just send us your name and address and we will send you by mail just 30 of Yvonne's Hearts of Flowers, the latest Parisian perfume to sell among your friends at only 10 cents each. Eight different odors—White Rose, Lily of the Valley, Lilac, Wood Violet, Heliotrope etc. No trouble at all to sell; everybody wants two or three. You will sell them all in an hour. Then return our $3.00 and you will receive at once by mail, postage paid, the handsome combination vanity case, coin purse, and card case and the 25 cards with your name on each. Write to day before you forget.

TO WASH DAY SLAVES

Women were slaves once. Some of them have never gotten over it, particularly on wash day.

If YOU are still bound and shackled by wash day slavery, investigate the "Playtime" Washer. Do not confuse it with the old-fashioned Washers that you have heard of. As a power machine it is specially adapted for the country where gas, gasoline, steam engine or windmill power is available.

See the "Playtime" at your dealer's or send to us for full information.

CUMMER-DOWSWELL, Ltd.
256 Hamilton, Ontario

RAW FURS

Our specialty is CANADIAN RAW FURS. Write for our free price list. We pay all mail and express charges. Remit same day as goods received. Hold shipments separate when requested. Prepay charges for returning furs if valuation is not satisfactory. We do not buy from dealers, but from trappers only.

HALLMAN FUR CO., Toronto Ontario

N. Hallman, Manager, 4 years with John Hallam; E. J. Hagen, Treas., 11 years with John Hallam; J. L. Jewell, Buyer, 6 years with John Hallam; G. Hagen, Secy., 7 years with John Hallam.

from having been in contact with the diseased tubers.

2nd. Do not plant potatoes on the fields that have produced a diseased crop within ten years at least.

3rd. Do not use for clean potatoes old bags, barrels or crates that have held diseased potatoes.

WHAT TO DO IF YOU HAVE NO POWDERY SCAB ON YOUR POTATOES.

1st. Select every year for seed, the best potatoes from the best producing rows you have; tubers that are clean, of medium size and regular in form. Pick these out in the fall when digging and store them apart from the crop that is for sale. This will keep your potatoes up to the standard and you will not need to change seed.

2nd. Avoid every possible source of seed or soil contamination.

Keep your farm free from the disease

CAP. XXIV.

(Passed 20th March, 1913.)

An Act to Prevent the Introduction and Spread of Insects, Pests and Plant Diseases, Destructive to Vegetation.

Be it enacted by the Lieutenant-Governor and Legislative Assembly, as follows:—

1. This act may be cited as the "Injurious Insect and Pest Act, 1913."

2. In this Act and in any regulation made thereunder, "Vegetation" shall mean any tree, shrub, vine or plant, or the fruit or any other portion of a tree, shrub, vine or plant.

"Inspector" is a person appointed for the carrying out of the provisions of this Act, and the Regulations made thereunder.

3. The Lieutenant-Governor-in-Council may take such regulations as are deemed expedient to prevent the introduction into the Province of New Brunswick, or the dissemination therein of any insect, pest or plant disease, seriously injurious to vegetation.

4. Such regulations may provide:

(a) For the prohibition generally or from any particular country, region or place, of the admission into the Province of New Brunswick, of any vegetable or other matter likely to introduce into the Province any such insect, pest or plant disease.

(b) The terms or conditions upon which any such vegetable or other matter may be admitted into the Province of New Brunswick.

(c) For the treatment and method of treatment to be given to any vegetation, vegetable matter or premises, to eradicate, control or prevent the spreading of any insect, pest or plant disease, seriously injurious to vegetation, and may prescribe whether such treatment shall be given by the owner or by a person appointed for such purpose.

(d) For the prohibition of or treatment prior to the sale of disposal of any vegetation or vegetable matter infected with any such insect, pest or plant disease.

(e) The occupier of the premises on which is discovered any such insect, pest or plant disease, shall immediately notify the Minister of Agriculture, and shall also send specimens of such insect, pest or plant disease to the said Minister.

(f) For the confiscation of any vegetable matter and the container thereof, if any, in respect of which a breach of this Act, or any regulation made thereunder is committed, and generally for any other purpose which may be deemed expedient for carrying out this Act, whether such regulations are of the kind enumerated in this section or not.

5. The Minister of Agriculture may appoint inspectors or other officers for carrying out this Act and the regulations made thereunder, and such inspector or other officers, so appointed, shall act under his direction.

6. Any inspector or other officer so appointed may enter in or upon any place or premises in which there is reason to believe that any such insect, pest or plant disease exists.

7. The Minister of Agriculture, upon the report of any inspector as to the existence of any such insect, pest or plant disease, in any locality defined in such report, may prohibit the removal from such locality of any vegetation, vegetable or other matter, which is likely to result in the dissemination of such insect, pest or plant disease.

8. Any person contravening or neglecting to carry out, or offering any hindrance to the carrying out of any provision of this Act, or of any regulation made thereunder, shall be liable, upon summary conviction, to a fine of not less than twenty dollars, nor more than one hundred dollars, together with costs, and in default of payment, to imprisonment for a period of not less than ten, nor more than thirty days.

9. The Lieutenant-Governor-in-Council may, by order, direct the inclusion in the provisions of this Act or any insect, pest or plant disease seriously injurious to vegetation.

10. Every Order-in-Council and regulation made under this Act, shall be published in the Royal Gazette in two consecutive issues.

Learn To Play

Piano, Organ, Violin, Mandolin, Guitar, Banjo, Cornet

New Methods, Wonderfully Simple, Easy and Rapid

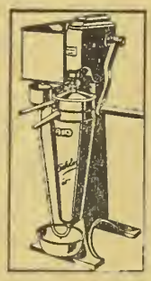
COMPLETE INFORMATION FREE

Let us tell you of a Wonderful, New and Simple Method by which young and old may learn to play by note the piano, organ, violin, guitar, mandolin, banjo, cello, cornet or other instrument. No knowledge of music is required. Those who have found old methods difficult or impossible, learn quickly and easily by this wonderful and new method. A few minutes of your spare time, evenings, will soon make you capable of entertaining your friends, teaching others or playing in public. Valuable alike to the beginner and to advanced pupils who wish to improve.

Thousands of pleased pupils throughout the United States and Canada praise this marvelous, yet extremely simple and easy system. Send your name and address to us today for complete information, booklet and reference all FREE. Tell us what instrument you would like to play. A post card will do. If two members of the same family desire information about different instruments, please explain clearly. Address

International Institute of Music
Institute Bldg. — Dept. 95 — Fort Wayne, Ind.

SHARPLES TUBULAR CREAM SEPARATOR



Patterned after the great world spinning on its axis, the revolving bowl of the TUBULAR has no fixed shaft and no fixed bearing. It is suspended by a flexible steel spindle, its weight being borne by a resilient ball bearing, permitting the bowl to run practically without rocking, with ease, smoothness and precision. Increases the centrifugal force without increasing the speed. The TUBULAR skims close, is easily and quickly cleaned, is built sturdily in all of its few parts. All gears are enclosed. It is constructed to afford a lifetime of durability and consumes little oil. Its suspension is natural and is not eccentric to its center of gravity.

SHARPLES MILKER

The MILKER is in daily use under all widely varying conditions in dairies of different classes, in all dairying sections of the United States and Canada. The teat cup with the upward squeeze is almost human in its ability to adapt itself to the proper way of milking cows of different temperaments. The fresh and heavy milker, the hard milker, the hold-up milker—all are milked as they should be milked.

The SEPARATOR CATALOG and the MILKER BOOK give full details regarding the construction and utility of these dependable SHARPLES products.

The Scab Disease of Apples.

A Bibliography by Prof. Errett Wallace was published at the Agricultural Experiment Station of Cornell University last summer, on the "Scab disease of Apples." This little book covers the subject in a most exhaustive manner, and a magazine article on the principal points brought out should be of interest to the readers of the Maritime Farmer, who have not had the most perfect results in their endeavour to grow clean fruit. The experiments cited refer more particularly to the State of New York, but their conditions are so like our own that the conclusions arrived at should apply with equal force to either Ontario or Nova Scotia.

In 1904 a study was made of 564 orchards containing 4881 acres. The average net gain from spraying three times was $40.23 an acre. Another count was made including only those orchards that were otherwise well cared for; the net profit in this case was $74.23 an acre. This is what should be expected since trees properly cared for are better able to produce a large quantity of fruit than those not well cared for. Ordinarily the reduction in quality of scaby apples is considered to be the main cause of loss, but this, however, is only one of the several factors, early scab infection, if not controlled in some years almost entirely prevents the setting of fruit, and also reduces the size of individual apples It was noticed in two epidemic years of scab, that apples from unsprayed trees were uniformly smaller than those from sprayed trees. Another important factor is in the keeping quality of the fruit, and in the devitalizing effect on the tree after a case of severe leaf infection; this prevents the formation of fruit buds for the following year, and hinders the normal wood growth which is the basis for future crops.

Apple growers have believed for years that cold wet weather during the blossoming period, is the cause of failure of fruit to set; there is ample evidence to prove, however, that in some years (as in 1913) the scab occurs on the blossom stems and causes the blossoms or young fruit to fall. It is even claimed by one authority that cold rains at blossoming time are not a factor in the setting of fruit. In a bulletin published in 1895 Prof. Baily says : "The immediate cause of most of our apple failures the last few years, is undoubtedly the apple scab fungus. And again, "The qest proof that the apple scab fungus is the immediate cause of the greater part of the apple failures of Western New York, is afforded by the fact that thorough spraying with Bordeaux Mixture is usually followed by a great increase in the productiveness of the orchard." While Prof. Baily does not say just how the disease so greatly injured the crop, there is no doubt the decrease was brought about by the occurance of scab on the stems of the blossoms of young fruit at an early stage, causing them to fall.

Another authority, Selby in 1910, states, that scab often causes the young fruit to fall, and that often this falling or failure of the fruit to set, which is attributed to frost injury or poor polination, is really due to scab.

The spores that carry the disease over the winter exist in little sacs in the dead leaves on the ground, and only begin to mature at or about the time the apple blossoms are ready to open. Mature spores were first found at Cornell on May 4th in 1908, and in 1910 on May 1st, the blossoms were about to open in each case. These spores do not all mature at one time, as the ripening process may continue for about a month. The description given by Prof. Wallace of the method of studying this spore discharge is most interesting; glue coated slides were placed in an inverted position over moistened leaves containing the spore sacs. A study was made as to how many would be discharged in a given time from a given area of leaf surface; how soon after wetting the leaves the discharge would begin; how long it would continue, and how long a single sac would continue to discharge spores. The most spores were caught on the slides placed only one half a centimeter, or about one-sixth of an inch above the leaf. From a fragment of leaf one centimetre square 5630 spores were discharged in forty-five minutes. From this it is estimated that if the surface of the ground beneath trees set 40 by 40 feet apart were covered with old leaves, there might be 8,107,000,000 spores discharged from each tree in three quarters of an hour. of wet weather. This ought to be enough to account for any early infection. The discharge of spores began within five minutes of the time the trees were wet, showing that spore shooting begins almost as soon as rain begins, and if kept continually wet it was found that a single leaf would continue to throw off spores for about ten days. It is probable that in nature some leaves would be found that would continue even longer than this, and the fact that from some leaves operations would begin earlier than from others would lengthen the period still more.

Prof. Wallace artificially inoculated leaves to see if he could learn the time of development. On leaves inoculated May 16th scab first appeared on May 24th, on May 23rd no scab was visible. On May 28th many infections showed on each leaf, while only a few spots could be found on any uninoculated leaf. From the inoculation on May 26th scab first showed on June 12th. The period of inoculation would then be from eight to fifteen days. At Cornell in 1908 the first natural infection appeared on May 22nd; as the mature spores were found on May 4th, they assume that some infection occured during the rains of May 7th, 8th and 9th, since these furnished the most favorable conditions for infection after the spores had matured. This gives a period of inoculation of thirteen to fifteen days. Favorable weather for infection also occured on May 13th and 14th; in this case the period wonld be from eight to nine days, which corresponds with experiments made earlier in the season. At Sodus in 1910 spores began to mature about May 1st; rain fell on April 29th, and on May 2nd and 3rd there were three quarters of an inch inch of rain, with good condition for scab infection. Scab first showed on the leaves on May 12th, giving a possible incubation period of from nine to thirteen days. There were weather conditions that would permit infection earlier than this date, but there are two reasons why the experimenter does not believe that any occurred before May 1st. First, no spores were mature before May 1st, and second, no scab appeared on foliage sprayed on April 29th.

As the first spot showed on May 12th, secondary infection could take place at the first favorable time after this. On May 24th rainfell heavily followed on the 25th by cloudy misty, weather; scab appeared abundantly on June 7th, showing an incubation period of about thirteen days duration. The amount of rainfall is not necessarily the important item in determining whether or not a certain rain permits infection; a more important factor is the length of time the trees remain wet. The ideal condition of infection, is a gentle continued rain, followed by cloudy calm weather and a saturated atmosphere, in which case the spores are kept wet for a long time while in one position. Any condition, such as poor air drainage, or dense foliage that prevents prompt drying out of the trees after rain has ceased, is most favorable to scab development.

The following table should be carefully studied to understand at what stage of the development of the buds scab infection is likely to occur.

Correlation of the first appearance of scab due to primary infection and the date on which the infection probably occurred, with the development of spores and of fruit buds.

Year	Date of first appearance of scab	Condition of buds at date of first appearance	Probable date of infection. Wet weather	Condition of buds at probable date of infection	Date when mature spores were first found
1908	May 22nd.....	Petals falling	May 7th te 9th	Almost opening	May 4th
1910	May 12th.....	Mostly in bloom	May 2nd to 3rd	Ready to open	May 1st

Prof. Wallace believes that leaves and buds are susceptible to infection as soon as they are exposed, but that infection does not occur until the spores have matured, or until the first appearance of weather conditions favorable for infection following the maturity of the spores. According to his experience, from three years observation, the spores do not reach maturity until the blossoms are either opening or just ready to open, and therefore that there is little danger of infection before this time. In Nova Scotia this last season, infection took place much earlier than this, as proved by the experiments of the Government Horticultural Station at Kentville. Spraying on May 8th, just as the leaf buds were unfolding giving practically perfect results, while where the application was deferred until May 20th just before the blossoms opened twenty percent. of the apples were spotted. As everyone knows this was a most exceptional season, for on account of cold, backward weather, the time between the opening of leaf buds was nearly twice as long as the average.

Many have noticed that the leaves of blossom buds become scabbed earlier than the leaves of leaf buds. These leaves are the first to open in the spring; they are exposed to the earliest infection, while those from leaf buds do not appear until later (ten days) and thus escape it. The leaves from fruit buds are exposed to both first and secondary infection, while those from leaf buds are, for the most part, subject only to the secondary attack. The first spore infection, however, is often not severe in itself, but it is the original

"ROSS" Cadet Rifle

EVERY FARMER NEEDS A GOOD RIFLE

The Ross sporting models—.303 and .280, are absolutely the best made, but for those who have no use for such high power arms, the new Ross 22 Model, which we call the "Cadet" because the Government has adopted it officially for Cadet Corps, is a splendid all round rifle.

Strong and well balanced, its barrel is accurate and its novel sights—a protected foresight and peep rear sight, are wonderfully easy to line on either bulls eye or game.

This rifle uses either .22 short, long or 22 long rifle.

Its action is safe and quick. Easy to clean. The best rifle to teach boys how to shoot.

If your dealer cannot supply you, write direct for illustrated canalogue to

You will look a good while before you find a better medicine for coughs and colds than Chamberlain's Cough Remedy. It not only gives relief—it cures. Try it when you have a cough or cold, and you are certain to be pleased with the prompt cure which it will effect. For sale by all dealers.

source of the secondary infection which is usually much more abundant, and which causes most of the scaby fruit as well as the greatest leaf infection.

From his experiments, Prof. Wallace came to the following conclusions: Early infection is caused entirely by the wintering spores on the dead leaves, and may appear during the first period of weather favorable to infection occuring after the spores have matured; usually not until blossomiug time or a little before. There is little danger that infection will occur much earlier, not because the leaves are not susceptible, but rather because the spores are not ripe.

The period of incubation may vary from eight to fifteen days, and after this period has elapsed a second crop of spores is produced, which may cause infection again or fifteen days after weather conditions favorable to their development; this generation may, in time, produce another, and so on throughout the season. However, the various infections do not always occur in successive jumps at intervals of eight to fifteen days as might be inferred from the foregoing. The first crop of spores do not all mature and discharge at the same time; they begin to ripen at about the time indicated above, and furnish a constant source of infection for a month or more. Thus individual infections belonging to the first generation may be started at several different dates, and produce their first crop of spores at different times.

After finishing the study of the life history of the scab Prof. Wallace takes up the most important subject of control. He says: "While there will always be enough fallen leaves exposed to permit infection, still if the orchard is plowed late in the fall or early in the spring, it is probable there will be much less danger from the early infection occurring about blossom time."

A striking demonstration is cited bearing on this point. Two MacIntosh orchards were under observation for several years; both were seriously effected with scab each year, and the loss from this cause was about the same in each; both orchards were in sod. About the middle of April, a fire started from a sugar camp, and swept over the entire area of one of these orchards. Not a scab spot could be found in this orchard the following summer, while the disease was quite common in the other orchard.

Pruning is also an important factor in controlling scab; the denser the foliage of the trees the more slowly it dries out after a rain, the better is the opportunity for the spores to germinate and cause infection. But it is certain that notwithstanding all the precautions that can be taken, by destroying dead leaves, correct pruning, etc., clean fruit cannot be grown unless the trees are properly sprayed.

The problem is to find the best fungicide, and to learn how and when it should be applied. The best authorities now agree that to control scab, lime-sulphur and bordeaux are equally efficient, but lime-sulphur has the advantage in other ways, as it does not russet the fruit and is easier prepared. When to spray is now the most important question, and to know when infection occurs is to know when to spray, for the fungicide must be applied first in order to prevent it. As we have shown, infection usually occurs when the blossoms are about to open, so spraying to be effective must commence a little before this, or when the buds are first beginning to show pink. Two applications, one immediately after the petals fall, and another two or three weeks later are necessary to prevent attacks from the secondary infection. The grower should watch, not only the condition of his fruit buds, but also the weather, and attempt to get the spray on ahead of general storm periods if possible. Some growers delay the spraying until after the rain is over if rainy weather happens to be threatening at the time, thinking that the rain will wash off the spray. No worse mistake than this can be made, for it is during wet weather that the spray is needed to protect the tree from infection. The spray will not wash off so easily as is supposed; if if it has twenty-five minutes in which to dry before any washing rain occurs, it will adhere well. In wet seasons, an application about August 1st may be necessary to prevent late infection.

Prof. Wallace does not find any evidence to prove that a dormant spray of lime-sulphur has any effect whatever in controlling scab. In two different years experiments, it was impossible to detect any difference on sprayed and unsprayed trees, using a strong lime-sulkhur wash.

The importance of making each application at the proper time is emphasized very strongly. Any grower having from fifty to one hundred acres of mature apple orchard, who expects to do all his spraying with a single outfit, will find it absolutely impossible to comply with this requirement, since as can be seen, the time limit for the most effective application of each spraying usually does not exceed from four to five days. Every grower, therefore, should have equipment to spray his entire orchard within this time. The spray may entirely fail to control scab if delayed one or two days too long, thus permitting the infection to occur before the application is made. The effect of continued spraying from year to year is most important, and seems to have a cummulative effect on the vigor of the tree, and thus enables them to set a larger crop of fruit. The foliage being protected remains healthy and vigorous, and consequently the trees are able to produce a larger number of strong fruit buds. This bibliography, "The Scab Disease of Apples," should be carefully read by every grower of apples.—Manning K. Ells.

Amatite ROOFING

Make the Dealer do the Painting

INSTEAD of asking just the price for the roofing, ask him how much for the roofing *including* keeping it painted for 10 years.

In the case of most roofings, the price will jump considerably. In the case of Amatite Roofing, it will stay the same, for Amatite has a mineral surface and *needs no painting.*

A few years ago every ready roofing on the market required painting and you had no choice. Now that Amatite has demonstrated its practicability there is no reason why you should fuss with painted roofings any longer.

Just reflect next time you buy roofing that if you specifiy Amatite it is the same as if you had made the dealer promise to take care of the painting. And remember Amatite costs no more than the kinds of roofing that require regular painting.

Amatite is sold almost everywhere. We shall be glad however, to send you a booklet and sample free on request. Address our nearest office.

HERE is why the owners of the biggest barns in Canada choose Neponset Paroid Roofing:

"Slowly made" roofings are the only kind that wear out slowly. You *can't* make good roofing quickly. Rush the manufacture and you get "patchy," uncertain products. Omit tests and inspections and you get roofing products quick to "run" in summer—quick to become brittle in winter—quick to start a leak—quick to wear out altogether.

Get "Neponset Roofings"—the "slowly made" kind. Nothing skipped. Nothing skimped. Every dollar's cost gives a dollar's worth of durability. Any one can easily lay them. They are the finest kind of insurance against repair bills—fire—and all roofing troubles.

Sold by dealers everywhere. Write for name of nearest dealer

Unadulterated Maple Products.

J. H. M., York Co., N. B., writing on the 6th inst, says:

Farmers in this vicinity, who have sugar maple orchards are now busily egagged making maple surgar or maple honey, as it is usually called, and maple sugar and candy. The Queensbury farmers never adulterate their products and they have the banner section of the province for the manufacture of maple sweets. Some get orders from England. We are not making maple products this year as we are too busy with other work. We have often shipped to British Columbia. We have just passed over to neighbors two large orders one for Victoria, B. C., parties and the other for parties in Fort George.

150 Acres Fully Equipped $2300

Rich loamy fields cut 25 tons hay; spring-watered pasture; 60 apple, 50 plum, also peach and cherry trees; sugar orchard of 300 trees; estimated to be 1000 cds. wood beside the timber; only 2 1-2 miles to R. R. village and mill; good schools, mkts. and advantages; splendid 9-room painted house; new barn for 10 head; never failing water supply; aged owner to close out before spring's work will throw in 4 blooded cows, horse, calf, 4 pigs. 150 poultry, farm machinery, wagons, etc. price tor all only $2300, half cash; for all details and travelling instructions to see this and a money-making equipped farm of 90 acres for only $1500, easy terms, see page 3, "Strout's New Spring List," just out; choice selections of real bargains at wonderfully low prices throughout N. S. and the N. E. States; send today for your free copy, E A. STROUT FARM AGENCY, Box 2612, Boston, Mass.

A FARMER'S GARDEN

Helps his wife to plan her table in busy times. Saves work and worry, saves buying so much meat, gives better satisfaction to the help. A good garden will be almost impossible in your busy life without proper tools. They cost little and save much hard work.

IRON AGE WHEEL HOES AND DRILLS

will sow, cultivate, ridge, furrow, etc., better than you can with old-fashioned tools and ten times quicker. A woman, boy or girl can do it. Can plant closer and work these hand tools while the horses rest. 38 combinations from which to choose at $3.00 to $14. One combined tool will do all of the work. Ask your dealer to show them and write us for booklet, "Gardening With Modern Tools" and "Iron Age Farm and Garden News" both free.

Some Practical Suggestions on Soil Cultivation.

Continued on page 502

as, on some of the land there that was not underdrained it was nearly a total loss. Besides, hauling roots and grain off land that is wet caused a great deal of damage to the physical texture of the soil. In fact, it is very hard to estimate just what this loss may mean to us in dollars and cents.

I am sorry that the time at our disposal will not permit us to go into the details as to the benefits to be derived from underdrainage. Successful crop production is the basis of agricultural prosperity and uniform moisture supply is the most important factor in crop production. This evidenced from the fact that often the poorest soil on the farm may produce a better crop in a suitable season than the richest piece in an unfavorable season.

Generally speaking the variations in seasons is largely a variation in moisture conditions and as has been stated before heat and air are controlled to a very great extent by the amount of moisture in the soil.

Now we can control the moisture contents and thereby increase the production of the soil. If the spaces of the soil is filled with water, air will be kept out, heat will not be produced so readily and excessive moisture has been shown to be injurious. Underdraining will withdraw the excessive amount of moisture, air will be allowed to circulate and heat will be produced. Bacteria will become more active and chemical changes will take place more rapidly, hence, plant food is produced more rapidly for the immediate use of the plant. Underdraining prevents the baking and cracking of the heavy soil, such as clay and loam.

When the heavy soils like clay are saturated with water they swell, then when they dry out they shrink and if this soil has been wet for some time then worked becomes sticky. On drying and shrinking this clay will eventually cement together and when the heavy strain comes on the surface even deeper cracks open. Now if this land is underdrained, the water will be withdrawn from it before it has time to become saturated and it loses its sticky puddly effect, when worked. Underdraining enables the plant roots to go deeper into the soil and thus procure moisture from deeper soils, when the supply near the surface is low. Then, too, they feed from plant food that is stored down deep in the soil. The fact that soil is underdrained increases its water holding capacity after a heavy rain and yet be in a better condition for working than the undrained soil. In the case of the undrained soil the excessive amount of water generally runs off along the surface carrying with it a great deal of the richest and finest soil. Whereas, in the case of the underdrained soil the water percolates through the soil slowly for as the space in the soil is filled with air before the rain comes on it must escape before the water can enter the soil by passing out through the underdrains allowing at the same time the rain water to be taken up and shortly after the soil can be cultivated and a mulch formed to conserve the moisture for the plants. Time will not permit me to say more about the importance of underdrainage and its beneficial effects.

We conclude then that to insure productiveness in any soil we must have, in addition to plant food, lots of humus, sufficient moisture, considerable heat, plenty of pure air and repeated cultivation at the right time."

Renfrew Machinery to Extend Business

The Renfrew Machinery Company is the latest Ontario concern to give more attention to trade in the Maritime Provinces. The company has been represented on th s ground for some years, with the Maritime branch office at Sussex, N. B. It is now proposed to strengthen up the sales end of the Eastern Branch and with this end in view Mr. E. H. Vickers, took over the management of the territory. Mr. Vickers has lost no time in getting down to business and is equipping warehouses, etc., at Sussex which will enable his company to carry all their lines in quantities which will permit them to meet all orders promptly. In addition to this the Renfrew Machinery Comaany feels that the change has been rendered necessary by the large increase which the business has been showing during the past few years. Mr. Vickers, who is a brother of the general manager of the company, is a hustler and is out to make Renfrew wares still better known in the east. At the Sussex warehouses, it is proposed to carry full lines of Standard cream separators, Renfrew Standard gasoline engines, Renfrew truck scales, and other staple machinery for which the concern is noted.

Why Not Keep the Better Kind.

Just as long as a dairyman knows only the production of all his cows, just so long will he be without the necessary incentive to take steps for herd improvement. But when he knows his cows individually as to production and cost of feed, then he can retain the abundant and economical producers.

The general results as applied to a district are full of suggestion. In one lot of 422 cows belonging to 42 men, the average yield last year was found to be 4,494 pounds of milk, the cost of feed $32.90; thus, simply taking the cost of feed into consideration, leaving a net profit of $14.28. But a slight investigation showed that the 100 best cows produced milk to the value of $7,137.00 the 100 poorest cows produced only $3,200.00 or much less than half as much.

The best cows were fed at an average cost of $38.42, leaving a clear profit above the cost of feed of only $1.74 each.

It thus is evident that each one of the 100 best cows made as much clear profit on the milk produced as that given by eighteen of the poorest.

Why not keep the better kind? It pays to find out which kind are in your herd. Milk and feed records may be obtained free on application to the Dairy Commissioner, Ottawa.

Test 3.0 or 4.8—Which ?

One of the chief reasons for testing cows not simply once in a while, but at regular intervals, is found in the fact that they are known to vary so greatly and often so inexplicably. Apart altogether from what are termed normal variations from milking to milking, besides the variations between morning and evening, and the variations between the fore milk and the strippings, careful observers have noticed in two days a variation in the test of almost two per cent of fat in the milk of individual cows, for which no reason has been assigned.

Obviously then it would be quite unfair to judge any cow on any one isolated test when it might be 3.0 one day and 4.8 another day. Which could you take? A fair and just way is to take samples regularly and test a composite sample once every month. Then there will be credit given where it is really due, not necessarily to the one that is supposed to be a high tester, because she is of fancy name or fancy price, but frequently to some tacitly despised individual which is really the queen of the dairy. It will pay to select those cows that are known, not supposed to yield milk rich in fat.

Selling Good Cows Cheap.

The following is a sample of what is discovered by the simple weighing of milk and testing of samples. A four year old cow gave in one month $20 pounds of milk containing 35 lbs. of fat. In the same herd a five year old gave only 330 pounds of milk and 19 pounds of fat. Thus the first cow gave more than the other two combined.

This further fact is interesting; this particular cow was sold by a man absolutely ignorant of her value or dairy capacity. The present owner, through keeping individual records, knows her better and would not sell her for less than thirty dollars more than he paid for her.

Another fact is worth careful attention; the total of the herd yield for a day or a month will never reveal these good individual. What the owner needs to know for certain is obtained only from a record of each cow he keeps. You can save labor and good feed by bestowing them on cows that you know are worth keeping; you will then be in a position to keep your best cows, and will not lose money by selling good cows cheap.

A Great Producer and Breeder.

The four-year old Holstein cow, Iola Piebe De Kol, owned by S. A. Baird & Son, Wisconsin, has had four living calves in 14 months, and made a semi-official yearly record of 17,390 lbs. of milk, making 699.92 lbs. butter.

Fertilizer Analysis.

In reply to E. H. B., we would say that A. McGill, Chief Analyst, Dominion Department of Agriculture, Ottawa, will analyse samples of Muriate of Potash and Nitrate of Soda, bought for fertilizing purposes when submitted to him through the proper channels.

THE HORSE.

Wounds in the Knee.

In the case of injured knees the rendering of "first aid" is of considerable importance, because what is done, even more than what if left undone, often very materially affects the subsequent progress of the case, the manner in which the wound is repaired, and the extent of the blemish Much the same remarks apply to those minor cases of injury which are the subject of domestic treatment. Wounds of the knee are of very varying degrees of severity, and thus the popular term "broken knees" covers a very wide range, and embraces several varieties of wound. In it are included the "graze" that has no more serious consequences than a temporary loss of hair (the later blemish from which may be so slight as to defy detection by any but the most careful observer), the seriously torn and lacerated skin, the penetration of the sheaths of the tendons, and the worst injury of them all, and the most difficult to deal with so far as treatment is concerned, the open joint.

TREATMENT.

In all cases it is a first essential to remove all dirt and foreign bodies, and to render and keep the wound aseptic. Too much hot fomentation or subsequent poulticing is not desirable, for wounds so treated make a bad repair, and the usual result is a "bumpy" knee, because the heat and moisture induce soft and profuse granulations. It is a good plan immediately after the accident to foment with warm water, to remove all foreign matter, but this is quite a different matter from free and frequent bathing with hot water, such as is commonly practised, as part of the treatment of broken knees. Wounds of the front of the knee are commonly of the lacerated and contused variety, and in such cases great care should be exercised in examining the wound to see if any foreign body is present. Very often hard bits of stone or dirt are driven into the wound, and unless removed, they prevent healing, or if it should heal it breaks out again. During the exploration, or as part of it, the wounds should be carefully and patiently fomented with warm water containing some antiseptic. The addition of carbolic acid in the proportion of 1 to 100 of water is useful. The ordinary plan of fomentation, or what is generally so described, is practically useless for cleansing wounds of the front of the knee. The method known as irrigation should be employed. A soft, clean sponge should be used, and the carbolised water applied above the wound, so that the fluid trickles down through it, and this should be done not only with the foot placed plane upon the ground, but with the knee slightly bent so that all parts of the rent are cleansed. Half an hour of this irrigation not only removes all foreign matter, but removes pain and stiffness.

Wounds of the front of the knee may, without the use of technical designations as to variety, be roughly divided into six kinds: (1) Simple abrasion, commonly called a "graze", with loss of hair. In such cases no treatment is required; indeed, the popular plan of healing with such an injury—by hot fomentations, bandages, or the application of stimulating liniments or hot "oils"—is calculated to do more harm than good. There will be only a little oozing of blood, which may be sponged off with clean cold water, and the surface painted over with friar's balsam, or a little of the compound tincture of benzoin applied on a pad of cotton wool. This is merely a solution of several aromatic gums—benzoin predominating—in spirits of wine, and the spirit in drying off leaves a thin film covering the surface that protects it from the air. A spirituous solution of the shellac or French polish answers a similar purpose. (2) When the knee is badly bruised, but not cut—Bruises are really contused wounds where the skin has been ruptured. There may be considerable solution of continuity of the parts under the skin, subcutaneous haemorrhage, etc., which may result in such a case the head should be tied short to a high rack to prevent the horse lying down, and movement, as far as possible, discouraged, for the skin may be so injured that only a little additional pressure would cause it to slough, and if there is any sloughing of the skin there is sure to be a permanent blemish. The treatment required beyond the preliminary fomentation which will do much towards reducing the pain and preventing swelling, is to sponge lightly several times a day with a mild astringent lotion, such as two drachms each of powdered alum and acetate of lead in a pint of distilled or rain water. (3) When the skin is cut we have the lacerated and contused wound, which it is most important to cleanse thoroughly from all dirt and foreign matter, and to render and keep aseptic. Rarely, if ever, are stitches to be inserted in lacerated wounds, for the surrounding tissues and skin are generally so weakened in vitality and structure that sutures would not hold, and in the case of lacerated and contused wounds of the front of the knee there is the additional risk of sutures being torn out of the bending of the joint. The stitches are only a source of irritation, and where they tear out, or the skin sloughs, there is an increase in the permanent blemish. The hair should be carefully trimmed from the edges of the wound, and the divided skin brought into opposition, and so kept by means of strips of plaster placed longitudinally, and so disposed as to admit of free drainage. Even under the most favorable conditions suppuration, and it is most necessary

Bog Spavin

Cure the lameness and remove the bunch without scarring the horse—have the part looking just as it did before the blemish came.

Fleming's Spavin Cure (Liquid) is a special remedy for soft and semi-solid blemishes—Bog Spavin, Thoroughpin, Splint, Curb, Capped Hock, etc. It is neither a liniment nor a simple blister, but a remedy unlike any other—doesn't imitate and can't be imitated. Easy to use, only a little required, and your money back if it ever fails.

Fleming's Vest-Pocket Veterinary Adviser describes and illustrates all kinds of blemishes, and gives you the information you ought to have before ordering or buying any kind of a remedy. Mailed free if you write.

FLEMING BROS., Chemists,
41 Church Street, Toronto, Ont.

"My little son had a severe cold. I was recommended to try Chamberlain's Cough Remedy, and before a small bottle was finished he was well as ever," writes Mrs. H. Silks, 29 Dowling Street, Sydney, Australia. This remedy is for sale by all dealers.

to keep such wounds well drained and aseptic. There is a large amount of agents possessing the required antiseptic properties, but for wounds of the front of the knee we have found nothing so suitable as chloride of zinc or a solution of Burnett's Fluid.

"PROUD FLESH."

In healing by granulation, the granulation if profuse, and soft, may quickly fill up the wound and overtop the surface, forming a fungoid growth, popularly known as "proud flesh," which has to be repressed or kept back by caustics. A lotion of chloride of zinc of a strength of one drachm to the pint of distilled or rain water is most useful. Dress healing must be by granulation or with this tiwce a day, by allowing it to gravitate into the wound from above downward, or irrigate with a small glass male syringe. Treated in this way there is no foetid discharge no burning or cauterising of profuse growths that overtop the surface of the wound, but a rapid even repair, that leaves the least possible blemish. Should the granulations be very profuse it is a good plan to rub them back with a lump of sulphate of copper or bluestone. The disfiguring "bumpy" knee is the result of neglect of this precaution.

SERIOUS CASES.

The other three forms of wound of the front of the knee—exposure of the tendon and opening of its sheath, laying open of the joint, and exposing the bones, and open joint with fracture of one or more of the small bones entering into its formation—are not cases for domestic treatment, and in such cases it is best to seek professional aid without delay. In rendering "first aid" the animal should be got into the nearest shed, box or stable, the head tied up, and the wounds well irrigated with some antiseptic lotion, such as carbolic acid solution recommended above, an nothing more should be done pending the arrival of the veterinary surgeon. When, after cleaning and a careful examination of the injury, it is decided that the case is one for home treatment, it will be well to consider the advisability of giving a dose of physic. This, in many cases, seems to have a magical effect, and tends to prevent and reduce any swelling of the part consequent on the injury. The corn should be dropped, and the animal fed on bran mashes, carrots, and hay. In the majority of cases very little attention is paid to preventing movement, and yet it should be obvious that movement is not favorable to repair. Rest is most essential, but not the kind of rest obtained by turning the animal into a field to walk for a living. Horses with recently injured knees are often kept at work, and when we see a horse working in knee-caps we always wonder what is underneath them. The best plan is to confine the animal to close quarters, discourage movement, and put a "cradle" on the neck to prevent gnawing, rubbing or other interference with the wound. This gnawing often causes considerable blemish, which is above all things to be avoided in the healing of broken knees, because the greater the blemish in the shape of a bumpy knee, irregular repair, and loss of hair, the greater depreciation in commercial value. Exercise or turning out to grass may be beneficial later on, or when the wound has ceased to discharge, but in the case of recent injury rest should be provided for and movements discouraged. In very bad cases splints to the knee and slinging, to relieve the limb of the weight of the body, are advisable.

GROWTH OF THE HAIR

A question that generally exercises the mind of the owner of the broken kneed horse is. What will make the hair grow? But it is one that can rarely be answered satisfactorily, and more rarely still can the desire of the owner be realized as quickly as he hopes or expects. The amount of the blemish left after cicatrisation depends on the amount of damage done to the true skin. Where skin has been cut away, or has subsequently sloughed, and the hair follicles are destroyed there is no agent that can reproduce the growth. We cannot make hair grow, although there are some agents that have a stimulating effect on the hair follicles. Even in slight wounds the hair often grows the wrong way, and leaves a roughness that a careful examination will not fail to detect. Under such circum stances it is usual ro shave both knees, and to apply a mild blister—perhaps the best method known of preventing the detection of a slight injury. Some blister a badly broken knee as soon as it is healed, for the double purpose of exciting the absorption of superfluous material brought to the spot in affecting the repair and stimulating the growth of hair. Sometimes the hair grows white over a contused knee, and here there is no remedy except to dye it, or, if the surface is not extensive, to pull out individual hairs with a pair of fine tweezers. Diluted mercurial ointment stimulates the growth of hair, and if this is stained with a little lamp black or with lamp black and a touch of Armenian bole, to match the color of the "points" it serves a double purpose —stimulates the growth of hair and, in the meantime hides the blemish.—F. & H., Vet., England.

Your poor horse needs DR. WILSON'S DERBY CONDITION POWDER. Buy him a tin today. It will pay you and please him. Two sizes, 25c. and 50c.

John A. Bruce & Co., Limited., Hamilton, Ontario. Established Sixty-four years.

Meeting of Poultrymen at Fredericton.

Some weeks ago a delegation of New Brunswick poultrymen called on Hon. J. A. Murray, Minister of Agriculture, at Fredericton, and talked over the matter of giving more encouragement to poultry exhibitions, with the Minister and Mr. Daggett, the Secretary of the Department. After cpnsiderable discussion the Minister advised the delegates present to hold a meeting and draw up an agreement that would be acceptable to each Association. Mr. Murray assured the delegates that he would give this every consideration, and give a reply as soon as possible. After Messrs. Murray and Daggett with drew the delegates held a meeting with Mr. Seth Jones, Poultry Superintendent, in the chair.

It was decided that in order to strengthen and create interest in the poultry industry that a Provincial Poultry Association be formed and the following officers were duly elected. ...

Honorary President—Hon. J. A. Murray.

Honorary Vice-Pres.—Mr. J. B. Daggett.

President—J. V. Jackson, Moncton, N. B.

Vice-Pres.—A. E. Crowley, Fredericton, N. B.

Secretary—George H. Seaman, Moncton, N. B.

Board of Directors—Dr. R. D. Hagerman and Chas. Shaw, representing the Carleton and Victoria Poultry & Pet Stock Association; A. D. Thomas and Philip Cox, representing the York and Sunbury Poultry and Pet Stock Association; F. M. McCready and R. W. Whitlock, representing the Charlotte County Poultry & Pet Stock Association; S. E. McKie and Samuel Steeves, representing the Westmor:and Poultry and Pet Stock Association.

Rules and regulations were drawn up to govern the different local associations and a uniform prize list arranged to be submitted to the department for approval.

A resolution was passed asking the Honorable Minister of Agriculture to purchase 300 regulation size galvanized poultry coops and 25 larger size for geese and turkeys. A request was also made that no restriction be placed as to the number of classes on which the Department would pay a percentage of the prize money, the association agreeing to adopt the graded prize list and pay all prizes on bantams and pet stock. A full report of the meeting together with the proposed prize list and classification of breeds was forwarded to the Department and the association expects a favorable reply in a few days The delegates were very much pleased with their reception by Mr. Murray, and expect that with his assistance, the local associations will be in a better position than ever before to continue their efforts to encourage the breeding of purebred poultry.

Biddy as a Boarder.

When one attempts to follow the systematic work done by practical poultry keepers, and note the records made under practical if scientific rules of care and feeding, he is forced to the conclusion that there is a wide gap somewhere to be closed before we shall get rid of the boarders. At Storrs, Conn., in the third yearly contest, where fifty flocks of ten hens each are being tested, there are a number which have not laid an egg since Nov. 1. Now it costs very close to $1.58 yearly to keep a hen, and if, for six months, she doesn't surrender an egg, she must hustle tremendously the rest of the year to get inside the cost limit.

Bear in mind that the system of feeding is the very best that science and experience can evolve, so good that I want to reproduce it here for others to try.

It is not only necessary that we have good breeding stock which will produce good hatchable eggs, and that they be hatched in a good incubator which will give strong, vigorous chicks, and that they be well brooded, but they must be so fed as to grow continuously from hatching time to maturity. Here is the feed formula used by the Storrs Experiment Station:

Grain Ration	Parts by Weight
Cracked wheat	15
Cracked Corn	15
Pinhead oats	10
Broken rice	3
Wheat bran	2
Corn meal	1
Sifted ground oats	1
Daisy flour	1
Beef or fish scrap	1

This scheme offeeding is virtually what was used by the station last year.

In this test, it is a pen of white Wyandottes which leads, by more than one hundred eggs, all the rest. and strange as it may seem, they are owned, and were grown, by the same English gentleman as won the past two years with his Leghorns. Thus far in the twenty-one weeks, this pen has yielded up 785 eggs, where one pen of R. I. Reds has produced but 88, a pen of W. Leghorns but 40 these being the most notable failures. The test is bringing out some valuable lessons for every poultry keeper, and many o f these centre about the feed box and caretaker. One thing is certain, the time has come to eliminate the boarders everywhere and make certain a balance on the right side of the ledger from every animal kept on the farm.—Dr. Twitchell, in Maine Farmer.

To Improve Flocks Choose Good Layers.

The best and cheapest way to improve a flock is to select the best and most vigorous layers and breed these to a strong, active, well-bred male and then save the eggs for hatching.

Fowls whose offspring is worth keeping should be marked with leg bands, and if possible a record should be kept of their production, according to J. G. Halpin of the College of Agriculturei University of Wisconsin.

After selecting the most prolific birds in the flock, he would have 15 or 20 of them in a separate coop and large yard with the male during the few weeks of the breeding seasan. By limiting the number of hens to each male, most of the eggs he believes would be fertile, and nearly all of them hatch out strong, active healthy chicks. Keeping the male away from the remainder of the flock improves the market quality of those eggs which are not to be used for hatching purposes.

Peerless
Guaranteed Fencing
Strongly made and closely spaced—making it a complete barrier against large animals as well as small poultry. Top and bottom wires No. 9—intermediates No. 12 wire—made by the Open Hearth process which time and other tests have proven to be the best material made for the manufacture of wire fencing. Send for literature. Ask about our farm and ornamental fencing.
Agencies nearly everywhere. Live agents wanted in unassigned territory.

RED ROSE TEA "is good tea"

An Income For the Farmer's Wife

THE wife of every farmer should have her own income and her own bank account.

And it does not matter how busy you are in the home, or how little time you have to devote to the raising of poultry we can show you how you can make a good income and build up a substantial bank account by poultry raising the Peerless Way.

We can show you how to be independent of the money your husband gets for his crops and other farm produce, so that when you wish to buy clothes, or take a shopping trip to town, you can just stop at the bank and draw all the money you will require.

The Peerless Way Makes Poultry Pay

If you know the right way to raise and keep poultry it requires very little outlay or money, and takes but very little of your time. The right way is the Peerless Way, that is, by hatching the eggs in a Peerless Incubator and rearing chickens in a Peerless Brooder.

Send For Booklet

We have prepared a book for you entitled "Money In Eggs," if you would be interested in learning how other women like you are making independent incomes from the sale of eggs and plump chickens. Experience is not essential. We are practical poultry raisers ourselves and will furnish you all the information necessary to make your chickens pay you handsome profits.

Fill in and send this coupon now for full particulars.

LEE MANUFACTURING CO. LTD. 115 PEMBROKE ROAD
PEMBROKE ONTARIO CANADA

Eggs for hatching should never be saved from a hen that is sluggish and hangs around the roost in a sleepy and inactive fashion. The hardy types which lay best are preferable for breeding purposes. These are the ones with full crops, red combs and bright eyes, and the first to leave the roost in the morning, roam long distances in search of food, and are among the last to go to roost at night.

While the Leghorns and other small active breeds, 20 females can safely be mated with one male bird, with the heavier breeds 15 hens or less should be used in order to insure fertile eggs. It is best to limit still more of the number of females to be bred to old male birds.

Using these meehods of selection and mating does away with the possibility of the worthless hen stealing her nest and rearing a brood of inferior "brush pile roughers."

Prevent Hens Eating Eggs.

A friend of mine has a couple dozen Rhode Island Reds and White Wyandottes. He has taken the very best care of them, but only now and then an egg; didn't know but he had chosen the wrong breed. He said they were looking fine and singing away as happy as a country church choir—but no eags.

Something set him to thinking that perhaps they were eating eggs. He called the attention of a neighbor to it and learned that darkening the nests would stop it. So he went out and nailed on a curtain in front of the nest box. While he was there a little red pullet jumped up on the box, cocked her eye up at him, sat down on the nest and in a minute it was all over. He reached out his hand to gather in that egg when in went three or four heads after it. The next morning he got seven eggs, day follow ng nine. He says those confounded hens are so blamed cross from having their lunch cut out they will not look him in the face.—N. L. H.

One of the greatest losses to the poultry trade, so a manager of a large poultry packing house declares, is from poorly fattened chickens that come off the farms. The packers call these "ranger" chickens. Of all poultry breeding places the farm should not be the one to put out such a loss—a place where feed is plenty. The farmer who sends "rangers" to market should be ashamed of himself.

If you breed for a purpose, and never breed except from your strongest birds, inbreeding is not dangerous; that is, breeding from you own flock year after year; because in a large flock many are bound to be too distant in relationship to make inbreeding a menace to all. It is breeding indiscriminately, w th no regard to selection for strength and difference in relationship, that works disaster.

One can keep a pen of the same geese for ten years. At 10 years old the goose looks young and is still producing strong goslings. Sometimes a hurt of some kind on foot or wing has been knawn to make her rest over one season without laying, but the next she is likely to be as good as new. A goose certainly pays for itself ten times its patronage, corn and housing bill in the eggs, the goslings and the feathers it gives you to turn into hard cash.

David Copperfield.

By Charles Dickens.

(Continued.)

I was so filled with the play, and with the past—ior it was, in a manner, like a shining transparency, through which I saw my earlier life moving along—that I don't know when the figure of a handsome well-formed young man, dressed with a tasteful, easy negligence which I have reason to remember very well, became a real presence to me. But I recollect being conscious of his company without having noticed his coming in—and my still sitting, musing, over the coffee-room fire.

At last I rose to go to bed, much to the relief of the sleepy waiter, who had got the fidgets in his legs, and was twisting them, and hitting them, and putting them through all kinds of contortions in his small pantry. In going towards the door, I passed the person who had come in, and saw him plainly. I turned directly, came back, and looked again. He did not know me, but I knew him in a moment.

At another time I might have wanted the confidence or the decision to speak up to him, and might have put it off until next day, and might have lost him. But, in the then condition of my mind, where the play was still running high, his former protection of me appeared so deserving of my gratitude, and my old love for him overflowed my breast so freshly and spontaneously, that I went up to him at once, with a fast-beating heart, and said:

"Steerforth! won't you speak to me?"

He looked at me—just as he used to look, sometimes—but I saw no recognition in his face.

"You don't remember me, I am afraid," sa d I.

"My God!" he suddenly exclaimed. "It's little Copperfield!"

I grasped him by both hands, and could not let them go. But for very shame and the fear that it might displease him, I could have held him round the neck and cried.

"I never, never, never was so glad! My dear Steerforth, I am so overjoyed to see you!"

"And I am rejoiced to see you, too!" he said, shaking my hands heartily. "Why Copperfield, old boy, don't be overpowdered!" And yet he was glad, too I thought to see how the delight I had in meeting him affected me.

I brushed away the tears that my utmost resolution had not been able to keep back, and I made a clumsy laugh of it, and we sat down together, side by side.

"Why, how do you come to be here?" said Steerforth, clapping me on the shoulder.

"I came here by the Canterbury coach to-day. I have been adopted by an aunt down in that part of the country, and have just finished my education there. How do you come to be here, Steerforth?"

"Well, I am what they call an Oxford man," he returned; "that is to say, I get bored to death down there periodically—and I am on my way now to my mother's. You're a devilish amiable-looking fellow, Copperfield. Just what you used to be, now I look at you! Not altered in the least!"

"I knew you immediately," I said: "but you are more easily remembered."

He laughed as he ran his hand through the clustering curls of hair, and said gaily:

"Yes, I am on an expedition of duty. My mother lives a little way of town; and the roads being in a beastly condition, and our house tedious enough, I remained here to-night instead of going on. I have not been in town half-a-dozen hours, and those I have been dozing and grumbling away at the play."

"I have been at the play, too," said I. "At Covent Garden. What a delightful and magnificent entertainment, Steerforth?"

Steerforth laughed heartily.

"My dear young Davy," he said, clapping me on the shoulder again, "you are a very Daisy. The daisy of the field, at sunrise, is not fresher than you are! I have been at Covent Garden, too, and there never was a more miserable business. Holloa, you sir!"

This was addressed to the waiter, who had been very attentive to our recognition at a distance, and now came forward deferentially.

"Where have you put my friend, Mr. Copperfield?" said Steerforth.

"Beg your pardon, sir?"

"Where does he sleep? What's his number? You know what I mean," said Steerforth.

"Well, sir," said the waiter, with an apologetic air. "Mr. Copperfield is at present in forty-four, sir."

"And what the devil do you mean by putting Mr. Copperfield into a little loft over a stable?" retorted Steerforth.

"Why, you see we wasn't aware sir," returned the waiter, still apologetically, "as Mr. Copperfield was anyways particular. We can give Mr. Copperfield seventy-two, sir, if it would be preferred. Next you, sir."

"Of course it would be preferred," said Steerforth. "And do it at once."

The waiter immediately withdrew to make the exchange. Steerforth, very much amused at my having been put into forty four, laughed again, and clapped me on the shoulder again, and invited me to breakfast with him next morning at ten o'clock—an invitation I was only too proud and happy to accept. It being now pretty late, we took our candles and went upstairs, where we parted with friendly heartiness at his door, and where I found my new room a great improvement on my old one, it not being at all musty, and having an immense four-post bedstead in it, which was quite a little landed estate. Here, among pillows enough for six; I soon fell asleep in a blissful condition, and dreamed of ancient Rome, Steerforth and friendship, until the early morning coaches, rumbling out of the archway underneath made me dream of thunder and the gods.

CHAPTER XX.

Steerforth's Home.

When the chambermaid tapped at my door at eight o'clock, and informed me that my shaving-water was outside, I felt severely the having no occasion for it, and blushed in my bed. The suspicion that she laughed too, when she said it, preyed upon my mind all the time I was dressing; and gave me, I was conscious, a sneaking and guilty air when I passed her on the staircase, as I was going down to breakfast. I was so sensitively aware, indeed, of being younger than I could have wished, that for some time I could not make up my mind to pass her at all, under the ignoble circumstances of the case; but, hearing her there with a broom, stood peeping out of the window at King Charles, on horseback, surrounded by a maze of hackney-coaches, and looking anything but regal in a drizzling rain and a dark-brown fog, until I was admonished by the waiter that the gentleman was waiting for me.

It was not in the coffee-room that I found Steerforth expecting me, but in a snug private apartment, red-curtained and Turkey-carpeted, where the fire burnt bright, and a fine hot breakfast was set forth on a table covered with a clean cloth; and a cheerful miniature of the room, the fire, the breakfast, Steerforth, and all, was shining in a little round mirror over the sideboard. I was rather bashful at first, Steerforth being so self-possessed, and elegant, and superior to me in all resperts (age included); but his easy patronage soon put that to rights, and made me quite at home. I could not enough admire the change he had wrought in the Golden Cross; or compare the dull, forlorn state I had left yesterday, with this morning's comfort and this morning's entertainment. As to the waiter's familiarity, it was quenched as if it had never been. He attended on us, as I may say, in sackcloth and ashes.

"Now, Copperfield," said Steerforth, when we were alone, "I should like to hear what you are doing, and where you are going, and all about you. I feel as if you were my property."

Glowing with pleasure to find that he had still this interest in me, I told him how my aunt had proposed the little expedition that I had before me, and whither it tended.

"As you are in no hurry, then," said Steerforth, "come home with me eo Highgate, and stay a day or two. You will be pleased with my mother—she is a little vain and prosy aboat me, but that you can forgive her—and she will be pleased with you."

"I should like to be as sure of that, as you are kind enough to say you are," I answered, smiling.

"Oh!" said Steerforth, "every one who likes me, has a claim on her that is sure to be acknowledged."

"Then I think I shall be favorite," said I.

"Good!" said Steerforth. "Come and prove it. We will go and see the lions for an hous or two—it's something to have a fresh fellow like you to show them to, Copperfield—and then we'll journey out to Highgate by the coach."

I could hardly believe but that I was in a dream, and that I should wake presently in number forty-four, to the solitary box in the coffee-room and the familiar waiter again. After I had written to my aunt and told her of my fortunate meeting with my admired old school-fellow, and my acceptance of his invitaion, we went out in a hackney-chariot, and saw a panorama and some other sights, and took a walk through the Museum, where I could not help observing how much Steerforth knew, on an infinite variety of subjects, and of how little account he seemed to make his knowledge.

"You'll take a high degree at college,'j said I, "if you have not done so already; and they will have good reason to be proud of you."

"I take a degree!" cried Steerforth. "Not I! my dear Daisy—will you mind my calling you Daisy?"

"Not at all," said I.

"That's a good fellow! My dear Daisy," said Steerforth, laughing, "I have not the least desire or intention to distinguish myself in that way. I have done quite sufficient for my purpose. I find that I am heavy company enough as I am."

"But the fame—" I was beginning.

"You romantic Daisy!" said Steerforth, laughing still more heartily; "why should I trouble myself that a pack of heavy-headed fellows may

A WOMAN'S MESSAGE TO WOMEN.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides regularly or irregularly, bloating or unnatural enlargements, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, I invite you to write and ask for my simple method of home treatment, with ten days' trial entirely free and postpaid, also references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by this method. Write to-day. Address: Mrs. M. Summers, Box. 109 Windsor, Ont.

COULD NOT STAND ON FEET

Mrs. Baker So Weak—Could Not Do Her Work—Found Relief In Novel Way.

Adrian, Mich. — "I suffered terribly with female weakness and backache and got so weak that I could hardly do my work. When I washed my dishes I had to sit down and when I would sweep the floor I would get so weak that I would have to get a drink every few minutes, and before I did my dusting I would have to lie down. I got so poorly that my folks thought I was going into consumption. One day I found a piece of paper blowing around the yard and I picked it up and read it. It said 'Saved from the Grave,' and told what Lydia E. Pinkham's Vegetable Compound has done for women. I showed it to my husband and he said, 'Why don't you try it?' So I did, and after I had taken two bottles I felt better and I said to my husband, 'I don't need any more,' and he said 'You had better take it a little longer anyway.' So I took it for three months and got well and strong." — Mrs. ALONZO E. BAKER, 9 Tecumseh St., Adrian, Mich.

Not Well Enough to Work.

In these words is hidden the tragedy of many a woman, housekeeper or wage earner who supports herself and is often helping to support a family, on meagre wages. Whether in house, office, factory, shop, store or kitchen, woman should remember that there is one tried and true remedy for the ills to which all women are prone, and that is Lydia E. Pinkham's Vegetable Compound. It promotes that vigor which makes work easy. The Lydia E. Pinkham Medicine Co., Lynn, Mass.

WHY HE WAS LATE

"What made you so late?"

"I met Smithson."

"Well, that is no reason why you should be an hour late getting home to supper."

"I know, but I asked him how he was feeling and he insisted on telling me about his stomach trouble."

"Did you tell him to take Chamberlain's Tablets?"

"Sure, that iswhat he needs."

Sold by all dealers.

gape and hold up their hands? Let them do it at some other man. There's fame for him, and he's welcome to it."

I was abashed at having made so great a mistake, and was glad to change the subject. Fortunately it was not difficult to do, for Steerforth could always pass from one subject to another with a carelessness and lightness that were his own.

Lunch succeeded to our sight-seeing and the short winter day wore away so fast, that it was dusk when the stage-coach stopped with us at an old brick house at Highgate on the summit of the hill. An elderly lady, though not very far advaoced in years, with a proud carriage and a handsome face, was in the doorway as we alighted; and greeting Steerforth as "My dearest James," folded him in her arms. To this lady he presented me as his mother, and she gave me a stately welcome.

It was a genteel old-fashioned house, very quiet and orderly. From the window of my room I saw all London lying in the distance like a great vapour, with here and there some lights twinkling through it. I had only time, in dressing, to glance at the solid furniture, the framed pieces of work, (done, I suppose by Steerforth's mother when she was a girl), and some pictures in crayons of ladies with powdered hair and bodices, coming and going on the walls as the newly-kindled fire crackled and sputtered, when I was called to dinner .

There was a second lady in the dining-room, of a slight short figure, dark, and not agreeable to look at, but with some appearance of good looks too, who attracted my attention; perhaps because I had not expected to see her; perhaps because I found myself sitting opposite to her; perhaps because of something really remarkable in her. She had black hair and eager black eyes, and was thin, and had a scar upon her lip. It was an old scar—I should rather call it, seam, for it was not discolored, and had healed years ago—whfth had once cut through her mouth, downward towards the chin, but was now barely visible across the table except above and on her upper lip, the shape of which it had altered. I concluded in my own mind that she was about thirty years of age, and that she wished to be married. She was a little dilapitated—like a house—with having been so long to let; yet had, as I have said, an appearance of good looks. Her thinness seemed to be the effect of some wasting fire within her, which found a vent in her gaunt eyes.

She was introduced as Miss Dartle, and both Steerforth and his mother called her Rosa. I found that she lived there, and had been for a long time Mrs. Steerforth's companion. It appeared to me that she never never said anything she wanted to say, outright; but hainted it, and made a great deal more of it by this practice. For example, when Mrs. Steerforth observed, more in jest than earnest, that she feared her son led but a wild life at college, Miss Dartle put in thus:

"Oh, really? You know how ignorant I am, and that I only ask for information, but isn't it always so? I thought that kind of life was on all hands understood to be—eh)"

"It is education for a very grave profession, if you mean that, Rosa," Mrs. Steerforth answered with some coldness.

"Oh! Yes! That's very true," returned Miss Dartle. "But isn't it, though?—I want to be put right, if I am wrong—isn't it, really?"

"Really what?" said Mrs. Steerforth.

"Oh! You mean it's not!" returned

Running water on the farm

A Fairbanks-Morse Pneumatic Water System like the one pictured here, can be quickly and easily installed on any farm.

It will furnish you with an abundance of running water for the bathroom, kitchen, laundry, stables, creamery, and for sprinkling the lawn and garden. At the same time it affords you ample protection from fire.

Can be inexpensively operated by hand, motor or small oil engine.

The "Handy" force pump which is a part of this system is easy to operate and will last for years. Tanks are made of boiler steel tested to a pressure of 125 pounds. Any size from 220 gallons up. Send for free booklet, "Fairbanks-Morse Water Systems."

We can supply you with farm engines from 1 h.p. up, sprayers, lighting systems, farm scales, hand and power tools, etc. Particulars on request. Address Dept. 44

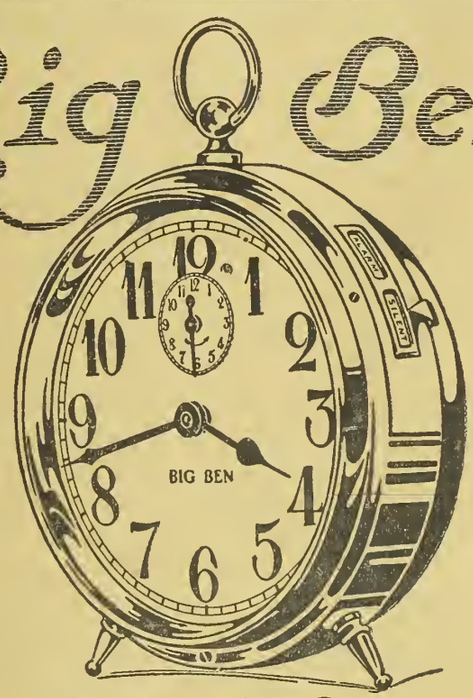
Big Ben



He's Big All Over And Good All Through

Big Ben is built for *endless* service. He has no "off-days," no shut-downs. His four years of existence have been one long record of on-the-dot accuracy. 7,000 Canadian dealers say that he does more *efficient work* for less pay than any other clock alive.

A Big Ben battalion, over 3,000 strong, leaves La Salle, Illinois, every day. Their sparkling triple nickel-plated coats of implement steel; their dominating seven-inch height; their big, bold, black, easy-to-read figures and hands; their big, easy-to-wind keys—all make Big Ben the world's master clock.

In return for one little drop of oil, he'll work for you a full year. From "Boots on" to "Lights out"—365 times—he'll guarantee to tell you the time o'day with on-the-dot accuracy.

He'll guarantee to get you up either of TWO WAYS—with one long, steady, five-minute ring if you need a good big call, or *on the installment plan*, with short rings one half-minute apart for ten minutes, so you'll wake up *gradually*, and he'll stop short in the middle of a tap during *either* call if you want to shut him off.

Big Ben is a mighty pleasant looking fellow. His big, open honest face and his gentle tick-tick have earned him a place in thousands of *parlors*.

The next time you go to town call at your dealer's and ask to see Big Ben. If your dealer hasn't him, send a money order for $3.00 to his makers —*Westclox*, *La Salle*, *Illinois*—and he'll come to you prepaid.

Miss Dartle. "Well, I'm very glad to hear it! Now, I know what to do! That's the advantage of asking. I shall never allow people to talk before me about wastefulness and profligacy, and so forth, in connection with that life, any more."

"And you will be right," said Mrs. Steerforth. "My son's tutor is a conscientious gentleman; and if I had not implicit reliance in my son, I should have reliance on him."

(Continued next issue.)

The Young People's Club—Its Possibilities.

Editor The Maritime Farmer:—

Young people whethet in the city, town, village or rural community demand some form of social life. The lack of organized social activity among young men and women invariably leads to moral and physical and spiritual disaster. The questionable forms of amusement all owe their existence to the fact that those who would lead young people into right avenues of activity for mind and body do not recognize, or refuse to recognize that man is a social animal and life and activity must express themselves in some way.

Social enjoyments foster refinement and the advantages accruing from young peoples clubs are even greater than those which accompany the clubs for older women. The pleasure from companionsnip should be even greater and the club itself has the possibilities for a larger achievement. Those interested in the matter of organization should see the preceding paper for full particulars.

WHAT TO STUDY

This is always the leading question for a new club to decide. It is wise to begin with a subject about which every member knows something. A club should avoid scholasticism. Subjects of human interest will weld the members more than any other thing. Every member should answer the roll call and every member each evening be given a definite opportunity to take part in the discussion. These are axioms for the successful club for young people.

READING CLUBS.

Ruskin tells us to read a good book every day. It may be a little poem or a choice bit of prose, but it opens up avenues for thinking and acts on the life and character. There is much to be gained by the solitary studyof a book which cannot be gained in any other way. Young people differ in temperament. Some young people can plan a course of study and carry their purpose to a conclusion regardless of other attractions; others find that they can accomplish greater results under the stimulus of companionship. We all need the social influence to draw out the best in us and keep us from being narrow and unappreciative of the human atmosphere and environment Reading clubs for young people supply these needs especially in small communities where the stimulus of a large circle of intimate friends is lacking.

SIMPLE READING CLUB.

In a small town the teacher discovered that the boys of her class were loafing about the streets and gaining access to papers and books of a most harmful nature. She suggested that the boys spend one evening each week at her home and read some good books with her. Most of the boys responded to the invitation. They chose a play and she assigned a part or character to each member of the class. The history of the period covered by the play was read also. Gradually the group of young fellows began to gain an intelligent grasp of the true meaning of educative reading. The student instinct was awakened and new talents developed. Much latent ability was discovered and an eager spirit of enjoyment in an entirely new realm of life made possible. The boys were permitted to bring a friend—boy or girl—and the study period was always followed by a few minutes of social enjoyment. This particular club was carried on for a number of years and as the members moved to other communities other clubs were organized and proved just as beneficial.

The program followed in this instance was as follows:

The first year they read "The Merchant of Venice." Lee's Life of Shakespeare and William Winter's "Shakespeare's England." Selections from Irving's Sketch Book, Stratford on Avon. The teacher procured picture post cards of all the points of interest. Sets may be secured from the larger book dealers made especially for this purpose if desired may be used with the reflectoscope. A synopsis of the plot and an analysis of the chief characters were emphasized in the stuhy. A set discussion was held one evening as to "The Hero of the Drama." At the close of the first season one of the boys was overheard expressing himself as follows: "If the fellows could only be made to feel how interesting Shakespeare's plays are, they wouldn't waste time reading the books they have to hide when their mother is around."

"CANADIAN LITERATURE CLUB"

This club was organized to meet a two-fold purpose'—to acquire a wider knowledge of Canadain literature and to develop the social life of the community. It proved a pronounced success in both departments.

One evening was given to the study of Canadian songs and national anthems. This field afforded an abundant fund of material for a musical evening.

A subject which was also most interesting and full of possibilities was "Wolfe in Canadian Literature." One talk was given on "Wolf in Fiction." Reference was made to Thackeray's "Virginians" and Henty's "With Wolfe in Canada." Special attention was given to Sir Gilbert Parker's "The Seats of the Mighty." "Wolfe in Poetry" was supported by selections from Dr. Jackenay's poems. A closing tribute was found in the magnificent words of Charles Sangster to Wolfe and Montcalm.

"The St. Lawrence and the Saguenay" was another subject, the historic and the romantic being strangely blended. "Canadian Dog Stories" brought to light selections from Marshall Saunders' "Beautiful Joe," and Edgerton Young's "Hector" and the history—simple and pathetic— of "Rab" by Dr. Brown.

This club met fortnightly in the homes of the memebrs, and refreshments were served each evening and a social hour spent.

CANADIAN INDIANS.

The study of the early nations and tribes of Canada is well worth a winter's study. The origin and traditions of tnese peoples are fully treated in McLean's "Native Tribes of the Dominion." Butles's "Wild

"My little son had a very severe cold. I was recommended to try Chamberlain's Cough Remedy, and before a small bottle was finished he was as well as ever," writes Mrs. H. Silks, 29 Dowling Street, Sydney, Australia. This remedy is for sale by all dealers.

To Suffer From Headaches

MAKES LIFE MISERABLE.

It takes a person who has had and is subject to headache to describe the suffering which attends it. The dull throbbing, the intense pain, sometimes in one part of the head, sometimes in another, and then again over the whole head, varying in its severity by the cause which brings it on, purely indicates that there is something amiss with the system. The fact that Burdock Blood Bitters reaches the seat of the trouble is due to its success in relieving and permanently curing the cause of the headache.

Mrs. Andson, 416 15th Ave. East, Calgary, Alta., writes: "For three years I was troubled all the time with sick headaches, and suffered also with constipation, and kept breaking out in pimples and sores on my face. I tried everything till at last a friend told me of Burdock Blood Bitters. I took two bottles, and my skin is as clean and pure as a baby's, and I have never been troubled with the headaches since."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

It costs only a one cent Postal card to answer any advertisement in Maritime Farmer and you will get many dollars worth of information.

Northland" contains a picturesque narrative of travels in the forests in the days of the Fur Trade. "The New North" by Cameron describes a journey to the North by water to the mouth of the McKenzie River. The paradise of the mountain climber is pictured in Wilcox's "Canadian Rockies." Prowse's "History of Newfoundland" is a thoroughly accurate history of the early inhabitants of that island Dominion. Dr. Grenfell treats the coast peoples in his own unique manner.

BOOKS WHICH LEND INTEREST TO CANADIAN HISTORY.

Some people acquire their knowledge of history merely by studying facts, while others long for the blending of narrative or fiction rather than a bald statement of events and dates. For those whoare fond of studying the history of Canada through the avenue of fiction, the following list of books will supply material for more than a winter's reading for any club.

Parkman tells the story of early Canadian life. "Old France in the New World" by Douglas is a survey of the history of Canada in the 17th century. The romantic story of Quebec is graphically told in Doughty's "Cradle of New France." "Canadian Types in the Old Regime" by Colby groups various aspects of French colonization around such characters as Champlain, Laval and Frontenac. The story of the French settlements on the shores of the Bay of Fundy is told by Hannay in the "History of Acadia." Wood's "Fight for Canada" is an accurate account of the long conflict between England and France in the New World. Bourinot's "Canada Under British Rule" emphasizes the political history of Canada from tne early days to the present. Laut's "Canada, the Empire of the North" is devoted to the romance of Canadian history. Probably the best survey from the time of the conquest to the war of 1812 is contained in "The History of Canada" by Lucas. A work by the same author, "Canadian War of 1812" is the most reliable history of the war from the Brisish side. Bradley's "Canada in the 20th Century" and Morgan's "Canadian Life in Town and Country" describes Canada today.

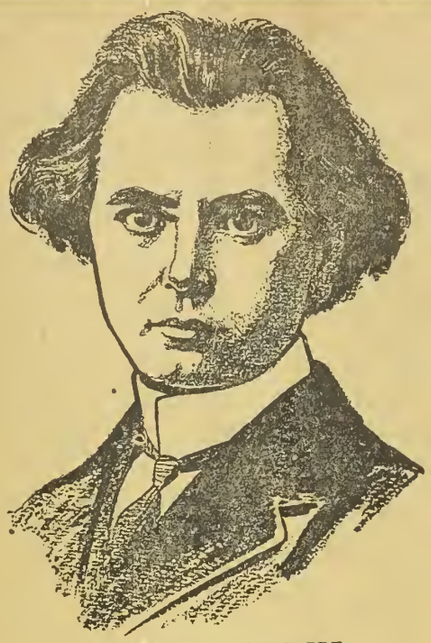
CANADIAN FOLK LORE

The character, legends and folk lore of the people of Quebec are sympathetically treated in Nicholson's "The French Canadian" and Frechette's "Christmas in French Canada" and Greenough's "Canadian Folk Life and Folk Lore."

The story of Murray Bay and the Seigneours associated with that vicinity is told by Professor G. M. Wrong in his "Canadian Manor." Lisgar in his "In the Day's of the Canada Company" describes the settlement of Upper Canada. Dawson's "The Saint Lawrence" is an exploration of Eastern Canada; Burpee's "Search for the Western Sea" explores the West.

WESTERN FUR TRADE

The dramatic story of the western fur trade is told by Launt in his "History of the Great North-West," and Bryce's "Romantic Settlement of Lord Selkirk's Colonists," gives us a reliable account of the origin and history of the Red River Settlements. MacBeth's "Making of the Canadian West" embodies the reminscences of a western pioneer and covers the period of the Riel Rebellions. Begg's "History of British Columbia" contains a summary of British Columbia to the year 1844. Mories" "Northern Interior of British Columbia" throws new light on the history of the Indian fur trade and gold mining.—Marion Dallas.



JAN KUBELIK
WIZARD OF THE VIOLIN

The eminent Bohemian Violinist who has used the NEW SCALE WILLIAMS PIANO during his last two Canadian concert tours, writes as follows:

Messrs Williams Piano Co. Nov., 12, 13.

Gentlemen;—

I very much appreciate the splendid New Scale Williams Player Piano so kindly sent me to my hotel. Its tone and simple machanism were a real pleasure. The piano used at my concert was entirely satisfactory and blended perfectly with the violin.

With best wishes I am,

Yours sincerely.

COULD NOT STRAIGHTEN UP
For Lame Back.

Women are coming to understand that weak, lame, and aching backs from which they suffer are due to wrong action of the kidneys.

The kidneys are overtaxed—given more work that they can do, and when the back aches and pains it is almost impossible to do her housework, for every move and turn means pain.

On the first sign of any weakness in the back Doan's Kidney Pills should be taken, and thus do away with any suffering from kidney trouble.

Mrs. A. J. Lalonde, Kingston, Ont., writes:—"I am writing to tell you what a wonderful cure Doan's Kidney Pills did for me. I was suffering with a lame back, and for about seven days could hardly straighten up for the pain. I had used quite a few of other kinds of pills, and received no relief. Just then my sister came and told me about Doan's Kidney Pills, and what they had done for her, so I decided to try them. I used three boxes, and I am completely cured, and I do not hesitate to recommend them."

Price, 50c. per box, 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

If ordering direct specify "Doan's."

New Brunswick Women's Institutes.

ECONOMIZING TIME AND LABOR.

We hear much today about scientific cooking and scientific farming, factories, offices and stores are everywhere using scientific management — that is, everything is planned and arranged so as to get the best results in the shortest time. It is now the households turn to be revolutioned, and this can be done in the same way —by systematizing and planning the work in advance. Of course one cannot lay down a general rule that will apply to all households, because every home and family are different; but, let every housekeeper plan her own work and apply the methods that suit her conditions best.

Every one knows, no matter how well the work is planned, there will be many interruptions, especially where there are children; therefore one should allow for interruptions, just as a storekeeper allows for profit and loss.

It is not because the housekeeper's work is hard or difficult that she finds so little time for rest or recreation, but because of the endless little things that have to be crowded into each day. The woman or mother, today, who works from the early morning until late at night, taking no time for rest or mental or moral culture, is neglecting the most essential part of her work as a homemaker. But, you say, "How can we find time with so much to do and so many to work for?" Only by leaving something undone.

"Labor with what zeal we will
Something still remains undone;
Something unaccomplished still
Awaits the rising of the Sun."

Make up your minds to do first, only the things really worth while. Find out what can be left undone without really affecting the comfort or happiness of your family: Suppose there was no Sabbath; would not the housekeeper find just as much to do with seven days to work in as she now does with six? And again, suppose there were two Sundays instead of one in each week, the work would have to be arranged so as to rest two days out of every week. Therefore, if the housekeeper would think it extremely necessary to take an hour for rest each day, or an afternoon or two each week for social intercourse, the work and the world would go on just the same. Everything that lightens our work and gives more time for recretaion and rest, is an economy—then let us think of a few ways in which we can economize "Time and Labor."

The most important part of the woman's work is the cooking and getting meals. The parlor may go undusted and no one grumble, but let a crowd of hungry children, or what is worse, a hungry man, come in and find no dinner ready—that is a different story! Economize space whenever possible, especially in the kitchen. The nearer the kitchenette, or pantry, stove and table are together, the less steps and work it requires to cook and get a meal. Have castors on the kitchen table and move it near the stove, sink or window, as it suits your special work best. There are so many inexpensive utensils one can get for lessening of the work in the kitchen. Have everything to work with, but no more than necessary. ...As the more one has, the more there is to keep clean and in order. Alternations can be made in almost every kitchen, making it feasible for more convenient work and many of these can be made by the housewife or the man of the house himself. A rack nailed against the wall over the table or sink will hold all the kitchen knives so one will not have to sort over a

Book for Men, Free

8,000 Words, 30 Illustrations

TO MY READERS:

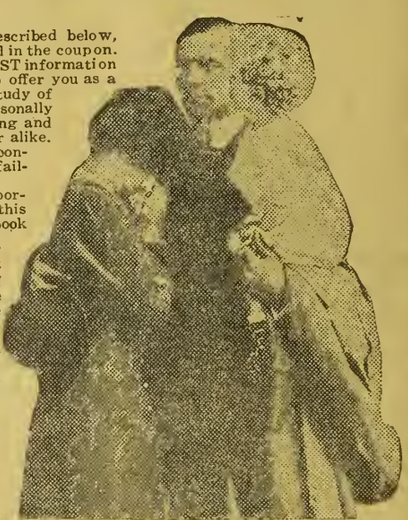
Of the little illustrated advice book described below, which I gladly send free to all men who fill in the coupon. I beg to say that it represents the very BEST information of a private nature which I am able to offer you as a result of over 30 years' observation and study of my subject, during which time I have personally interviewed many thousands of men, young and elderly, single and married, rich and poor alike, who came to me in confidence with their confessions of debility, lost nerve force and failing strength.

It is, reader, this vast and unusual opportunity which has enabled me to compile this very popular and valuable little free book (over a million of which have been sent everywhere to men who wrote me for them), and in a manner to reflect the exact living, breathing experiences and needs of real men who sought information as to the newer ways of self treatment without the use of drugs.

Remember, this book of over 8000 words and 30 illustrations will come to you by return mail in reply to your request, and in a perfectly plain, sealed envelope, for it is no one's business but your own what the envelope contains. There is absolutely no obligation on your part to buy anything or pay anything, and merely the receipt of this book which does not mean in any way that you are to use one of my VITALIZERS (see description below) and, in fact, only a portion of the book has any reference to the VITALIZER at all. Primarily it is a compendium of useful information for private reference, which you and all other men may easily profit by through life.

Therefore, please use the coupon, or if nearby, I should be very glad to have you call.

SANDEN, AUTHOR.



MANLY MEN MOVE THE WHOLE WORLD

It is a fact, reader, which you and I must recognize and admit, that the whole world admires and is fascinated by strong, vigorous, husky, manly manhood, and we must also admit that it is this same manhood and this alone which is back of the real leaders and producers in every walk of life. No matter where we go, we find it to be the manly, vigorous, vital fellow who forges to the front, who fascinates men and women of his community, who does the really great things. An unmanly man merely means nature's laws gone wrong, for it is he who halts and hesitates, who takes the back seat, who does not fit into the picture in a way that a manly, vital nature should. And yet, reader, it is my firm believe that any man, no matter what his past, no matter what dissipations or follies may have left their mark upon his physical and mental being, I say to you that such a man, unless there be some unusual reason, may hope for a complete return of his strength, vigor and self confidence, if he but go about his self restoration in a natural commonsense way.

I make a little appliance which we will call a VITALIZER, because I think that is the best word to describe its strange power. I don't want you to think of getting one of these VITALIZERS just now, but I would like you to investigate my claims as to what I believe can be accomplished by almost any weakened man who uses this VITALIZER faithfully for a few weeks. I speak, of course, of him who is willing to give up dissipation and lead a decent, conservative life, not only while using the VITALIZER, but for the future. The other kind of man, the dissipated, can hope for nothing from any treatment, no matter what it may be, hence such a man is eliminated from my consideration.

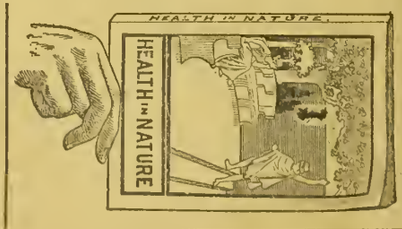
This little VITALIZER is made to wear upon the body all night. It weighs only several ounces and is no more unhandy than any ordinary belt, yet it generates a great FORCE that I call VIGOR, which flows into your blood organs and nerves while you sleep. Men say it often takes any pain or weakness out of the back in one application, and that 60 to 90 days' use has been sufficient to restore manly strength and to put men in the "never felt better in my life" class. Special attachments carry the FORCE of the VITALIZER to any part of the body, for the use of women as well as men in cases of rheumatism, kidney, liver, stomach, bladder, disorders, etc.

Over two hundred thousand of these VITALIZERS have been used or are now being used by men all over the world.

You had better learn more of this VITALIZER. It is fully described in my free book. If you live near me, why not call and test the VITALIZER yourself.

WHAT THE FREE BOOK TELLS

The free illustrated advice booklet mentioned above is meant to be a single declaration of certain important truths that every man in the world should know. The day has gone by when men are kept in ignorance of the real problems pertaining to these private subjects, and this illustrated advice booklet, which I send to men sealed, by mail, gives certain important facts relating to sex, just as these facts are. The booklet also fully describes my VITALIZER and you are told how you may get one for your own use if you decide that you want one. Please use coupon below, or call. Hours 9 to 6.



DR. M. F. SANDEN,

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

whole box full to find that particular paring knife one wants. Racks for dishes, sauce pans, etc., are also convenient. Old chests can be converted into boot boxes or drawers to hold kitchen towels, aprons, etc., and will serve as a seat besides.

Did you ever stop to think how many unnecessary steps and movements one makes in setting and clearing the table? So many will make trip after trip from dining table to kitchen, carrying a few plates or saucers at a time, while all might be piled neatly together and carried out on a tray, one trip taking them all. Did you ever stop to think how many unnecessary movements one makes in washing dishes if the draining tray is on the right of the dish pan? For instance, you take the dish to be washed in your left hand, with dish washer in your right; you wash the dish, lay down the dish-washer, take the dish in your right hand and lay it on the tray, while if the tray were on the left side only one movement would be necessary. All this seems of small account, but when you think of doing it three times a day and 365 days in the year, it means a lot of lost energy.

Then next to cooking comes the washing and ironing. This is something that cannot be left undone. There are so many labor-saving devices that lessen the work of washday, that even it can be made interesting. Perhaps the first of these to be considered is the washing machine and of these there are many kinds on the market. Perhaps the revolving kind is the most used. But there is also the steam washer, the suction and vacuum washers—all of which are satisfactory and so inexpensive are within the reach of all homes. But any machine that will wash a whole tub full of clothes at one time, doing away with the time it takes to wash each piece separately, is an economy of not only time, but money. In order to get the best results from any washer the clothes must be sorted and soiled spots treated with soap, and put to soak, and the washing powder or soap used plays an important part. By using Naptha soap one can do away with the boiling of clothes and thus save much time and steam.

A high stool is a great comfort to many housekeepers. One woman utilized a high chair with an arm off for this purpose and found it saved her feet so much, especially when ironing So many things need not be ironed. The sheets, pillow cases, underwear, etc., can be neatly folded and are fresher and more healthy if not ironed. Besides these labor saving devices there is the dustless dusters and the sweeping powder that will eliminate all dust. The vacuum cleaner is also getting to be within the reach of the modern home. Every housekeeper can clean, scrub and dust but the main thing is to keep things clean after you get them clean. Clean as you work—Have a place for everything and see that everything is kept in its place. Teach your children and other members of your family to do the same, but above all, arrange your work so as to have more time for rest and to be sociable not only to your own family but to your neighbors. Have an interest outside of your own home and thus broaden your ideas, for—

"Rest is not quitting the busy career,
Rest is the fitting of Life to its Sphere."

Written by Mrs. Chester Keith, president of the Cornhill Branch of the New Brunswick Women's Institute

YOURS TO ENJOY

You'll Like the Flavor

35¢-40¢-50¢ Per Pound

An Investment— Not an Expense

A MASSEY-HARRIS SPREADER on your farm will enable you to apply the manure when it will do the most good, even if help is scarce, for it is a great labor and time saver. -:- -:-

It spreads manure over more acres, because it is so thoroughly pulverized that all of it is available as plant food and need not be applied so thickly as would be necessary with hand spreading. -:- -:-

It makes possible the top dressing of field crops, which is usually the most effective method—the first rain carrying the fertilizing elements down into the soil. -:- -:- -:- -:- -:- -:-

On meadows and pasture lands it makes it possible to apply the manure so as to be of the greatest possible benefit—renewing the fertility without losing the use of the land for a time. -:- -:-

FLORICULTURE.

H. P., writes: "Tell me what to get for climbers for Hampton house.'

Dorothy Perkins, Shell Pink; Crimson Ramblers, crimson. The Dorothy Perkins is as easily grown as the Rambler, and is a beauty. All on their own roots and perfectly hardy, the above are the cream of the roses for our climate.

Amherst, N. S., writes: I have a large plant of Hyderanges that has been in the cellar all winter. About a month ago it was brought to the light as it had started badly. It was not repotted as it is in a large tub now. For a few weeks it developed finely, the leaves having a fine healthy green and developed splendidly; but the last few days some of the leaves are turning white about the edges shriveling. It is hard to keep wet enough and sometimes wilts a little at night. Would it hurt to let a little water stand in the pan that I keep under it? Will it have to be repotted? If so, will it hurt it after the buds are formed.

This plant will probably have to be repotted. The difficulty in keeping it moist shows that the tub is full of roots. It would be almost sure to injure the plant seriously to allow the water to stand in the saucer or pan. In repotting, do not disturb the roots and pack the soil firmly about the sides. If impossible to repot, use liquid manure or a prepared plant food, but repot the plant if at all feasible.

Fredericton, N. B., writes: Please tell me, as soon as possible, the season to procure and plant the bulb of the elephant's ear, Begonia, Gladioli, and should hardy Lilacs be all planted in the fall. Will Gladioli bulbs stay in the ground all winter.

The Caladium or Elephant's Ear, tuberous-rooted Begonias and Gladioli, tubers and bulbs, can be obtained and planted in boxes or pots any time now. Hardy Lilacs, such as Auratium, Rubrium, Speciosum, and the Tryridiac, can be planted in the spring with good results. Gladiolus bulbs do not winter successfully in this climate. Better dig them up in the fall, dry them off and plant in pots at this season.

For early bedding out, plant seeds of Asters, Stocks, Sweet Alyssiums, and Mignonette now in shallow boxes in a window. Cigar boxes make a very good box to grow seeds in the house. These seedlings should be

73 Dock Street. St. John, N. B.

transplanted when second leaf has developed, into another box, space them out two inches apart each way. Grow them in a cool temperature, with plenty of sunshine and they will be stocky and hard, when time to plant out of doors arrives.

In making up your list of hardy stuff, don't forget to order some of Goold's Sussex grown Roses. The Paul Nyron, mammoth roses bloomed twice last year on my own grounds—such big cabbage roses; pink, changing to the American Beauty color as it develops. Such a lot of buds on one bush, measuring from three to four inches across. Also the Mad Plantiro, white; Ulrich Brienner, finest crimson; John Hopper, red; Cardine Marnisse, white; Hardy Single Roses, Rugosa. I have tried all and know they will winter in this climate-

M. A. W., St. John, N. B. writes:—I have a nice pot of Maiden Hair Fern that was presented to me a year ago. It grew beautifully until the last few months. I find that the new leaves are not growing right; they seem to start freely from the earth, but I find, on close inspection, that they are nothing but stems which quickly shrivel and die, the little curly tops being apparently absent. What is the cause of this and what shall I do to prevent it?

This trobble is caused either by a snail or slugs. The new fronds start all right, but this pest is eating the little curly tops as soon as they begin to unfold leaving the bare stem which quickly dies. Look among the stalks and about the surface soil for a small snail with a flat spiral shell or a short fat shell-less snail or slug either one of which is probably doing the damage. A good magnifying glass is a great help in finding them.

Fairville, N. B., writes:—I have a rose bush in a large pot. It is a fine plant with many branches and the leaves look firm but the buds are covered with small cob-webs. The hard part of the bud has some little fine red specks on it. Will these hurt the buds? They seem to open very much slower than they usually do. Will a Mauranda vine grow from seeds and will it flower the first year it is grown?

The trouble with the rose buds is a little red spider. If the plant was badly infested the foliage would look rusty and the leaves quickly fall. A thorough spraying with clean water or the holding of the tips under a water tap will destroy these insects. The foliage of roses should b? frequently sprayed especially if in a warm room or a bright sunny window. Do not spray on a cloudy day or when the foliage will not dry before night, or they will mildew.

The Maudanda vine is easily grown from seed and will bloom the first year, if healthy.

All pot-bound plants should be repotted soon.

Geranium cuttings may be taken from now on. Use a light, sandy soil to root them in.

A sharp knife should be used to take cuttings, so that the bark will not strip up the stem of the cutting.

Never allow cuttings to become dry nor do they require any sunlight until rooted, simpiy a cool light place with fresh air.

Shamrock, St. John, N. B.— The leaf sent is a Genuine Shamrock. There are quite a number of varieties of this plant, differing somewhat in appearance. The trifoliate leaf being their distinguishing mark.

H. N., Hampton: What shall I plant my Pansy seeds in. They are a mass of young plants, so thick. They should be transplanted into boxes in the house, then again transplanted into hot beds or cold frames in the early spring. They thus make large plants for May blooming.

Another Successful Year Closes at N. S. A. C.

The formal closing of the Agricultural College took place Thursday afternoon, April 16. Several distinguished visitors were present, beside a large number of normal College students and a deputation from Pine Hill College, Halifax.

The interesting proceedings of the day opened with a spirited and most encouraging address by Principal Cumming to the students. This was followed by the presentation of diplomas and cups won in the different classes.

Out of a Senior class of 44 there were 38 who successfully passed all tests and exams, and some were very severe, and graduated from our N. S. A. C.

TheSeed-Judging Cup was awarded eo James Bremner, Chatham, N. B., and the premier Murray Cup for Live Stock Judging went to W. R. Shaw, St. Catherines, P. E. I.

Principal Cumming then called upon Mr. Justice Longley who responded kindly to the call for an address to the students, regretting that of late he had not been able to keep in with the work of the College but he found that hhe real progress far surpassed all his expectations and he gave the highest praise to the institution and showed appreciation of what it stood for. Judge Longley's address was exceedingly encouraging and his many old-time friends were delighted to have him in their midst again.

Then followed a fine speech from Hon. R. M. McGregori M. P. P. representing the Nova Scotia Government. He expressed the regret of the premier on being unable to be present. While proud of those who honored Nova Scotia by success abroad, Mr. MacGregor accords more honor to those who stay at home in a humbler sphere and improve conditions there. To the graduates he said: "You have a better chance than your fathers and neighbors and you owe it to the people of Nova Scotia, who have made this training possible for you, to be good citizens as well as good farmers."

Principal MacKinnon of Pine Hill, extended a cordial invltation to the students to visit the College, expressed on begalf of himself and the students their pleasure in visiting the College. By very apt agricultural illustrations, Dr. MacKinnon demonstrated to his audience what is expected from the students whose faculties are trained to make the best of their opportunities in this province.

Then came a good address from Dr. James, adviser to the Agricultural Department, and chairman of the Government Commission to inquire into the high cost of living. Dr. James defined the problem he is interested in as being the means of reducing the distance between two great groups, that of the consumer and the producer. He gave parts of an address "The Romance of Agriculture" and showed that in what seemed a most prosaic occupation, the history of some branches contains elements of romance. It was a capital speech.

After the good wishes of Principal ents, proceedings closed with God Cumming were extended to the stud- Save the King.

We congratulate the successful students on their proud position today; and any who did not come up to the high marks required for the N. S. A. C. Diploma, have no cause for discouragement. They have had a grand winter's study and a little further preparation will fit them the better for their's life's profession—the noble work of tilling the soil.

We will miss the gentlemanly N. S. A. C. students from our midst, they have indeed been madel young citizens, and we wish them "good luck" wherever they go.—Truro Daily News.

INTERNATIONAL POULTRY FOOD
Will Just Double Your Profits

There is more than increased egg production for you in International Poultry Food. This wonderful tonic—made from roots, herbs and seeds—is purely medicinal. It keeps the roosters and hens vigorous and healthy, cures and prevents disease and sickness, promotes good health, supplies material for bone, muscle and fibre. It is very beneficial during the hatching season.
Eggs from hens fed International Poultry Food produce fine, vigorous chicks.

Dealing With Kickers.

Kicking is a problem with which breeders and owners of horses will always have to contend. In attempting to deal successfully with the habit some horses have of kicking at persons or other animals in the stable, the disposition of the offender must be carefully considered. It will not do to adopt the same plan of procedure, for all cases, as a plan which may be perfectly successful in some cases would be worse than useless in others.

Some horses are not naturally of a vicious or sulky disposition, but have learned to kick solely as a result of bad treatment. This is the most general cause of bad tempered horses, and in order to overcome the habit the proper thing to do is to try to re-establish the confidence of the animal and to make him forget his hostility by consistently kind treatment, combined with frequent attentions, when the horse is in the stable. If the habit is not of too long standing and has not become completely ingrained in the horse, it may be eradicated by these means.

Horses which are vicious by nature or inclined to be so, sometimes get into the habit of kicking at persons without any real provacation and simply as a result either of excessive high spirits or of sheer vice. This is particularly liable to occur with the young horses, and with those which are underworked and kept standing idle in the stable a great deal, while at the same time being highly fed. The fact of a horse being "restive" owing to too little work and too much grain, is very apt to bring out any vicious tendencies which may be latent in his nature.

In those cases in which a natural propensity toward viciousness, or the high spirits and unruliness which are often found in young horses, give rise to the habit of kicking, drastic measures must be taken in dealing with them, if the habit is to be overcome. The offending animal must be treated with great firmness and requires to be kept in complete subjection. Whenever he kicks, or offers to do so, he should be sharply called to order, and the offence must never be allowed to pass unnoticed, as to do that merely encourages the horse to repeat it. Unless the animal, in such cases, is kept well under control and is firmly treated, he is most apt to take increased liberties, the habit gradually growing worse, and it may finally become so ingrained that eradication is impossible.

PUNISHING KICKERS.

As to punishing horses in these cases when they kick, this depends entirely upon circumstances, and due discretion must be observed. In many cases actual punishment would certainly make matters worse and serve to aggravate the habit instead of counteracting it. To hit horses in the stable with a whip is very often a sure way of making them kick, and a horse can be turned into a pronounced kicker in this manner. In some cases, however, the infliction of punishment on an incipent kicker by means of a cut with a whip whenever the animal kicks is attended by satisfactory results and helps to stop the habit. It depends upon the disposition of the horse whether it is advisable or the reverse to inflict punishment in the stable in dealing with vice or youthful unruliness. In any case great discretion must be exercised in regard to this question, and in the majority of cases punishment will be out of place and harmful. With many horses which are unruly in the stable, and evince their unruliness by kicking, plenty of hard and regular work is all that is needed to renher them more amenable and better behaved and to stop the undesirable habit, says a writer in "Indiana Farmer." In breaking a horse of any vice it is necessary always to take advantage of the limitation in his mind that makes him reason almost wholly from experience, and to convince him that after all your will is superior to his and that he has no alternative but to obey you, and to do so gently and quietly. Show him that it is in your power not only to handle him as if he were a toy, but to handle him very roughly, if you so desire.

These Honest, Time-Tried Ingredients— are the bulwark of RAMSAY QUALITY

In RAMSAY PAINT you get the most accurate and thorough combination of approved raw materials. Master painters will tell you no better materials exist. Your own good judgment will tell you that scientific machine mixing is superior to guess-work and "hand paddling."

Specify Ramsay for your next big-job—and for the odd jobs you do yourself get the right Ramsay finish. Splendid service from the local Ramsay dealer or write the manufacturers. (2)

Women's Institutes in P. E. I. 1913-14

During the past year the Women's Institute Movement in Prince Edward Island has been most encouraging in its work. Interest has been well maintained, many taking up as their special work that of Improvement of the School House, grounds and surroundings. Individual drinking cups as well as new doors and window shades have been supplied. In some instances a fee is paid for the regular cleaning of the room. In addition to the above work such subjects as deal with household economy in its many branches have been discussed. For the coming year special lines of study are being outlined, thus combining the literary, social and educational phases of the work.

There are now twenty-two organizations on the list with an approximate membership of 450, and as the members realize the great importance and scope of the work the enrollment increases.

The Department of Agriculture is planning to carry on extension work this coming summer when requests for meetings and organizations of new Women's Institutes will be granted those in sections not already represented.

The Prince Edward Island Branch of the Canadian Handicraft Association is co-operating in the work of the Women's Institutes and through its valuable efforts the members will be enabled to incidentally introduce into the rural school curriculum the art of plain sewing. In conjunction with the Handicraft work we are in hopes, of having a juvenile contest at the coming exhibition in which plain sewing done by girls between the ages of twelve and sixteen will be received. Should Boys' and Girls' Clubs be formed in connection with the Women's Institutes it will give a broader field for the latter in their endeavors to assist the young people of the community.

The opening of competition in the Annual P. E. I. Floral Show this coming autumn to the members of the Women's Institutes as organizations, with the privilege of entering individually, will be the means of encouraging the members in the study of floriculture and ultimately improving their home and school surroundings.

The question of giving Short Courses to the Women's Institutes is now being agitated and arrangements are under way for holding the first Women's Institute Convention which will probably take place in the early summer.

The Time for Fighting the Warble Fly.

Now is the time. The enemy is snugly nestling beneath the hides of the affected animals, and is completely at the mercy of man. He may be said to be helplessly asleep, and might, with an energetic and general onslaught, be utterly exterminated. In a few weeks from now he will awake, and once more resume his activities without fear of interruption. It is surprising to those who are acquainted with the life history of this tiresome and mischievous pest that no serious effort has ever been made to destroy it. No science or scientific knowledge is required to ensure success; neither is there any necessity to spend a penny on veterinary assistance. All that is required is a little exertion on the part of the cattle owner, directed as follows:— Every head of beast that was exposed during last summer to the attack of the fly should be at once placed in a pen and undergo careful examination by the eye and hand to discover the bots, which are now developed chiefly along the backs of the animals. As they are found, they must be squeezed out with the finger and thumb and stamped to death. Nothing could be simpler than such a process, and nothing more effective. Of course, the mischief has been done to the hide, and the poor animals have suffered much pain of which they have been unable to complain, but the idea is that of prevention for another season; and it is certain that, if every animal was so treated at once there would be no warble flies to harry the cattle in the coming summer, and cause an enormous amount of damage to the value of their hides to say nothing of their comfort and well-doing.

EWING'S RELIABLE SEEDS

Reproduce the Choicest Stock

"Like produces like".

Given proper soil and care, Ewing's Seeds will reproduce, in your own garden, before your delighted eyes, the choice, selected vegetables and flowers from which they themselves grew.

Breeding counts in plants as well as in animals, as Ewing's "pure-bred" seeds have been demonstrating by splendid crops for over forty years.

Start right—plant Ewing's Reliable Seeds—and get the most out of your garden. Write now for our Illustrated Catalogue, and if your Dealer hasn't Ewing's Seeds, order from us direct.

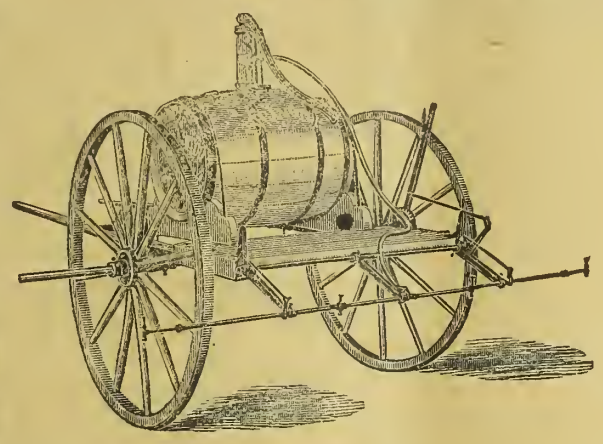
Seed Merchants, McGill Street, Montreal. 34



SPRAMOTORS

Here is an Unsolicited Letter from one of Canada's Foremost Authorities

MACDONALD COLLEGE

Ste. Anne de Bellevue, P. Q.,
Jan. 19th, 1914.

The Spramotor Co.,
London, Ont.

Dear Sirs:—

We used one of your model C power sprayers in our 30 acre orchard last year with entire satisfaction. With two lines of hose we had no difficulty in maintaining a steady pressure with the pump running only about two-thirds of the time, each line of hose throwing as much spray as a man could handle efficiently. We could easily have carried an extra line of hose had we needed it.

I might say that this power sprayer was one of the first power sprayers ever used in this Province and from the interest now being taken in spraying, there should be a large number of power sprayers brought in during the next few years, and I feel confident that from our experience with it, your machine will give good satisfaction to anyone using it. Yours very truly,

(Signed) T. G. BUNTING,
Professor of Horticulture.

FREE Write us particulars of what your spraying needs are and we will forward you by return mail a copy of our valuable illustrated treatise on Crop diseases, *without charge*. This puts you under no obligation whatever and secures you useful reliable information that can be got no other way.

In addition we'll send you full details of a *Spramotor* that will exactly fit your needs. You should at least know the facts, so write us today!

The London Spramotor,

1725 King St. E., London, Can.

Bought 20 Years Ago Still Do Good Work!

Twenty years ago takes us back to somewhere around 1894 yet we are constantly receiving letters from men who bought ***Spramotors*** as long ago as that and are still able to write us that their machines are in active and efficient use today.

What does this mean to you men who are thinking of getting a spraying outfit? Simply this:—that you can't buy a better or more durable machine than the ***Spramotor!***

The ***Spramotor*** of twenty years ago was not the advanced machine of to-day, yet the basic principles were right and are proven so by the fact that men are getting good results from our earlier models ***right now***. With the added experience and the various improvements we have been able to effect in all that time, rest assured that in the present ***Spramotor*** you get the utmost in spraying efficiency, durability, convenience and economy.

We want you to know that there is in the ***Spramotor*** line, a machine that will fiill your needs to a nicety. ***If not, we will make one.*** We have a first-class hand ***Spramotor*** selling as low as $6. This will do all the work necessary on smaller farms. Then we have machines mounted on hand carts, others on horse-carts, still others drawn by one or two horses in which the horse does all the work of pumping, and finally we build what is acknowledged to be the last work in spraying machines—our Model "C" Gasoline Power Outfit with every modern improvement and full accessories.

Diseases Mistaken for Hog Cholera.

Ninety per cent. of the losses from disease among hogs are due to cholera, but other diseases are often mistaken for it. This sometimes leads owners to blame serum because they have used it without benefit.

Garbage poisoning is one trouble sometimes mistaken for cholera. It results from feeding hotel and restaurant refuse containing large quantities of soap. The soap causes severe inflammation, and it or other irritating substances produce symptom much like those of cholera.

Worms cause troubles mistaken for cholera by multiplying in the lungs, causing irritation, stopping the air passages and giving rise to a cough and pneumonia. The animal becomes unthrifty and loses flesh, but does not die quickly or show the other characteristic symptoms of true cholera.

Worms in the intestines cause diarrhea, dullness, and lack of thrift, but their presence can usually be detected in the droppings. Cholera is not present if the animal does not show the other symptoms, including fever, redness of the skin, and sudden death. When worms are present the appetite remains good. Loss of appetite is usually an early symptom tom of cholera.

Tuberculosis rarely runs a rapid course in hogs and should not be mistaken for cholera. It occurs most frequently among hogs fed on slaughter house refuse, creamery or other skim milk containing tubercle bacilli, or those following cattle.

If in doubt as to the presence of cholera, have a competent veterinarian examine one or more of the dead hogs, but do not expect serum to protect against any of these other diseases. Hogs entirely immune to cholera may die from one of these other troubles.

The Noted Clydesdale Stallion

"Baron Kelvin"

Reg. No. 12462

will make the season of 1914 at the farm of J. W. Calbeck within one mile of Summerside, P.E. Island, and at Charlottetown. He has an unbeaten record in the show ring both in Scotland and Canada. In 1911 he won the championship at Toronto and Ottawa, defeating the best horses in Canada and in the same year he won first prize and championship at Ogdensburg, N. York, open to all breeds of draft horses. He is a massive horse, weighing about one ton and with superb quality. Service fee $15.00 for the season with return privileges should mare not prove with foal.

Also the trotting and carriage stallion

Capt. Aubrey

(48050)

the fastest trotting sire in Canada. Fastest producing son of "Peter the Great" in America Race record, 2-07¼. Trial 2.06¼. Record at 4 years, 2.15¼ on ½ mile track. Bay stallion 15.3½ hands weighing 1200 lbs., foaled in 1904.

Sire of "Aubrean" 2.17½ at 4 years and several others in the Standard List. Will stand for service at the farm of J. W. Calbeck Summerside, P. E. I. and in Charlottetown.

Service fee $25.00 with return privileges. Further particulars and cards of both the above horses upon application to

C. A. MITCHELL,
School St., Charlottetown.
or the owner,
JOHN RICHARDS,
Bideford, P. E. I.

Thought he had Lost an Old Friend.

Bliss M. Fawcett, one of the progressive farmers of Upper Sackville, N. B., whose name was inadvertently dropped from our mailing list, during his protracted illness and absence in the West writes:

November 14, 1913

The Maritime Farmer,
Sussex, N. B.

Gentlemen.—

"I wonder what I have done that my name has been taken from your list of subscribers. I have not had the "Farmer for a year or more. I wish you would kindly put my name on the roll again and have the paper sent me at once. I can't farm without it. While it has not been coming, I felt as though I had lost an old friend."

The editors of the Maritime Farmer are exceedingly sorry that Mr. Fawcett has been ailing for so long. A man of his cheery disposition and a constitution unimpaired by excesses of any kind is sure to win out in the fight against disease and we trust that ere long he may be able to again mix with his fellow farmers at their annual functions, where his counsel always stands for the uplifting of home and country in its broadest sense.

Peofitable Chester White Gilts.

In August, 1912, Maple Farm of Midlothian, purchased two bred Chester White gilts for $100. On September 27, 1912, one of them farrowed nine pigs. She raised eight, and farrowed again on May 29, 1913, raising ten. On Oct. 12, 1912, the other gilt farrowed ten pigs, and raised them. She farrowed again on May 1, 1913, and raised eleven pigs, and again on Oct. 6, 1913, raising 10 more. From the two first litters we saved six gilts. Of these five were bred and last fall they farrowed the following litters: Sept, 4, eight; Oct. 2, seven; Oct. 6, ten; Oct. 9, ten and Oct. 12, nine. This made a total increase from two gilts of ninety-three pigs in thirteen months. The two original gilts and their six daughters are all due to farrow again next spring.—B. W. Stretch, Cook Co., Ill., in Breeders Gazette.

A Farmer Ad. Accomplished the Task.

Mr. R. O'Leary, farmer, manufacturer of lumber, exporter of canned lobsters and fresh fish, writes:

Richibucto, N. B., Feb. 23, 1914.

The Maritime Farmer,
Sussex, N. B.

Gentlemen.—My ad. in your valuable paper has accomplished its purpose. Kindly discontinue same, and send me the bill. Will send you more business later.

Many sufferers from rheumatism have been surprised and delighted with the prompt relief afforded by applying Chamberlain's Liniment. Not one case of rheumatism in ten requires any internal treatment whatever. This liniment is for sale by all dealers.

Bread like Mother used to make—light, white and palatable—is easy if you use

REGAL FLOUR

Common sense tells you that it is a hopeless task trying to make good bread of inferior flour. You must have the right basis, or baking-day will only produce a batch of failures. Regal Flour is preferred by good housekeepers, everywhere, because its uniformly high quality is a known fact. Get a barrel of Regal from your grocer. If you don't find it all we claim, we'll refund your money.

Big Money-Making Equipped Farm

185 acres ; 8 blooded cows, pigs, poultry, hay, fitted wood, farm tools, seeds, fertilizer and machinery thrown in by widowed owner anxious for immediate sale ; 40 acres rich tillage, cutting 50 tons hay ; pasture for 20 cows and 200 sheep; fine large orchard ; 1 1-2 miles to depot, high school and fine mkts.; low price for everything if taken now, only $2,800, part cash ; for travelling instructions to see this and a 90 acre fully equipped farm for only $1,500, see page 3, "Strout's Spring List of Farm Bargains," just out; choice selections of real bargains at wonderfully low prices throughout N. S. and N. E. States; send today for your free copy. it will show you where to find just the farm you want at the price you wish to pay. E. A. STROUT AGENCY, Box 2612, Boston Mass.

HALF PRICE

During the month of June, we will sell sittings of (15) eggs from the World-Record pens. Barred Plymouth Rocks. Price for eggs from pen No. 1, $5.00. Average per pen last year 245 eggs. From pen No. 2, $3.50. Lady Morley's record last year was 292 eggs, the only sworn to record published. The authenticated World's Record.

W. B. COROWELL,
Morla Poultry Yards, Arcadia, N. S.

ONE CENT A WORD.

FOR SALE—Ayrshire bull from two weeks to two years. One Holstein two past. JOHN A. HUGHES, Petitcodiac, N. B.

ROSE COMB BROWN LEGHORNS for sale after June 15 to make room for young stock. Winners in show room and laying contests. Eggs for hatching $1.50 per 15. Mating list free. ERNEST PRINGLE, Stanley, N. B.

A Paying Proposition.

Dorchester, N. B., Jan. 6, 1914.
The Maritime Farmer,
Sussex, N. B.

Gentlemen.—Enclosed find bank money order to square account for advertising stock for sale. An ad. with The Maritime Farmer is a paying proposition that beats fox ranching all to pieces. May it's shadow never grow less.

Sincerely,
ANDREW McPHERSON.

Setting the Hens.

One should never carelessly set a hen. Some poultry keepers merely chuck the number of eggs they call a "setting" under the hen wherever she happens to have last laid and become broody. On the same old nesting material, under the same system of any hen that wants to lay in with her; then they scold because the eggs break and all manner of disaster beside make it a poor hatch. If the nest be secure and other hens not liable to bother it, let the hen brood the chicks where she laid, but is not, put her in a safer place, and make her brood where you want her to. With the standard bred you can do this, nine times in ten.

Where the hens lay in movable boxes or otherwise, before setting, the box should be thouroghly burned or scalded out. Fresh nesting material must be put in, and it is best to sprinkle vermin powder in this, as, mites are not in evidence, those big lice always are, and it is the nests they always hunt, to worry the hen and help make her break the eggs, for this is often why she breaks the eggs from so much uneasy moving about as she is bound to do.

When the nest is ready give the hen a thorough dusting, but don't put in the eggs until you are sure she means business, for often a hen does not at all, or else takes her time to by staying on the eggs well for a day, long enough to start the germ, then she may leave the nest for a day or night, or altogether, if you are not on the close watch, and the eggs are both spoiled for market or hatching—the latter especially, for the start must not be interrupted. When the chick is well started, the hen leaving the nest for several hours may not hurt the chicks in the shell at all.

In about seven days go over the hen again, and this should be the last going over with most vermin powders, as too lete a dusting often results in weak or sore-eyed chicks.

When the hen comes off don't make the mistake of giving her too many chicks to hover. She cannot warm more than a good dozen at any time through cold, damp weather, or even chilly spring nights. Giving a hen too many chicks at such a time simply invites a big loss from chill. Keep her much of the time tight in her coop, whereever it is—that is, at first. If let loose she is too prone to travel, even about a room given over to her, and let the chicks get too cold. If kept in a coop tight she coaxes the chicks to stay close to her, and though they run out in the snow, they soon scurry back to the heat.

The Maritime Farmer was sorry to learn a short time ago, that Mr. Bliss Anderson, Sackville, N. B., who in his younger days was probably one of the best known breeders of Shorthorn Cattle and Clydesdale horses in the Maritime Provinces had passed to his reward. We understand that his son, Laurie M. Anderson, who follows in his footsteps, as a breeder and who is one of the most intelligent and progressive farmers in his district intends to conduct the business under the old firm name of Bliss Anderson & Son. It is pleasing to us to see the young men stepping in and so nobly taking their place. Yet we cannot help feeling a pang of sorrow, when one of the fathers, who whas been instrumental in building up our agricultural resouces, passes away.

Order Your Horse Posters From The Maritime Farmer.

A Visit to the Nappan Experimental Farm.

While attending the Maritime Horse Show in Amherst last week, we were pleased to accept the invitation of our friend, W. W. Baird, Superintendent of the Nappan Experimental Farm to visit the farm.

We arrived there just in time to see a fine bunch of Grade Shorthorn Steers, that was stall fed in the farm stables, before they were shipped to supply the Easter market in St. John with prime beef. The steers were a particularly smooth even lot. Their broad loins were well covered. They were sleek and fat and their coats showed no signs of dirt, vermin or other disease. The heaviest steer in the lot tipped the scales considerably over 1600 pounds. The gains made since they were stabled were gratifying to the feeder and the price paid by Kane & McDonald, the St. John meat dealers who were the buyers, was nine cents per pound live weight, which leaves a nice margin for profit after all expenses have been credited.

We also saw several pens of stall fed lambs that Mr. Baird purchased last fall. These lambs were ordinary grades, purchased last fall put on clover, aftermath and later on rape and turnips. When winter set in they were fed clover hay, turnips and a little meal. Purchased for five and one-half cents per pound live weight and averaging about 80 lbs. each they are now going to market at eight cents per pound and averaging somewhat over 100 pounds each. They are thus realizing about double their cost price last fall. They too, will show a nice margin of profit over all expenses. The winter fattening of lambs in not followed very much in Maritime Canada. We see no reason why it would not pay some of our young farmers to do some work along this line. We feel confident that Mr. Baird will gladly furnish any information in this respect that interested parties may desire through the columns of the Maritime Farmer.

We were informed also of the experiment that is being conducted at Nappan in the breeding of dairy cattle. A couple of years ago a small herd of heifers of nondescript breeding was purchased. These heifers were mated to an Ayrshire bull. The heifer calves resulting from this mating were kept and when old enough to breed, were mated to another Ayrshire bull. Their progeny will be again mated to another bull of the same breed. The original nondescript cows were again mated to a Holstein bull and the heifers procured by their mating will later be bred to a Holstein bull, and heifers thus obtained again bred to a bull of the same breed.

Last year the nondescript cows were mated to a Guernsey bull, and when the heifers from this mating are old enough they will be bred to another Gurnsey bull.

In this way the experimental farm is grading up three herds from the original nondescript heifers. Records of milk and fat production of the various cows and heifers is and will be kept and it will be interesting to note the improvements made by the use of pure bred sires and contrast the progeny of the grades of the three breeds under the same care, feed and general condition.

Mr. Eben Craig, of Craig Bros., of Amherst, is now in charge of the poultry and apiary departments of the Nappan Experimental Farm. The bees are wintering well and the poultry are doing nicely. We saw a lot of lusty young chickens in the brooder house. The morning of our visit was one of the most blustery days experienced this winter, so we did not go out to the orchards, but we were

Just Like New

A NEW wagon without a coat of paint would look no better than the old wagon you have right in your barn—it's the bright, fresh, shiny paint on the new wagon that makes it appear so attractive.

Martin-Senour Wagon and Implement Paint

will make your old wagon "Spic and Span", and give the appearance of a new wagon, at small cost. This Paint is equally good for the Plow, the Reaper, the Binder, and all other Farm Implements that should be kept paint protected.

For every kind of painting you want to do around the farm, house, or barn, there is the right grade and shade in Martin-Senour Paints and Varnishes—just the right Finish for every purpose.

Let us tell you how to make things "Spic and Span" —write for "Farmer's Color Set" showing the various Paints and Finishes for farm service—free for the asking. 34

STEELE, BRIGGS SEED CO. LIMITED
HAMILTON - TORONTO - WINNIPEG

informed that Bert Robinson, the horticulturist in charge, has his work well in hand and this important line of farm work is not neglected.

Our genial friend, Robert Donaldson, the forman in charge of the live stock and field operations was delighted with the steer and lamb feeding experiments. He is always on the job and ever ready to show the visitor around and explain the why and wherefore of every operation under his charge.

Although Mr. Baird has been in charge of the Experimental Farm for only a comparatively short period he has a good grasp of the situation, and his years of practical experience and Agricultural College training are being used to the best possible advantage to show the Maritime Province Farmers what they may accomplish by systematically and persistently following the right channels.

Optional Inspection of Stallions.

Editor Maritime Farmer:

I enclose copy of Act relating to enrolment of Stallions, Chapter 9, Statutes of Nova Scotia 1913, relates to Inspection of Stallions (and also replaces Schedule in Enrolment Act by nine other forms. We have no copies of this Act struck off but I am eclosing circular letter which we sent out a short time back. We expect to have copies of Inspection Act printed shortly with amendments of 1914, and will forward you a copy.

"According to the Amended Stallion Enrollment Act of 1913, owners of Stallions in addition to being required to enroll their stallions with the Department of Agriculture, have also the option of having them inspected and having a certificate issued in accordance with this inspection. If, for example, your horse is a pure bred horse, the best certificate you can have is Class I. Enrolled, Inspected and found free from the malformations and diseases named under said act. Class 2, is enrolled, inspected and found to have (names of unsoundnesses attached.) Class 3, is "Enrolled but not Inspected."

The general implication that the public will make if the horse is not inspected is that the owner is afraid to have him inspected by virtue of some unsoundness he may possess, known to the owner. The initial cost of enrollment is $2.00, annual renewal $1.00. Cost of inspection, provided our legislation goes through as expected) will be $2.50. The inspection, you understand, is not compulsory, but if a man has a sound horse he gets the very highest certificate.

"It is important that we should know at once whether you wish to have your stallion inspected and have the highest possible certificate issued in accordance with the inspection.

"We will have to arrange a route for the veterinary inspector and I would like to hear from you at once if you desire your stallion inspected. We will appreciate the fact that this inspection will necessitate a large expenditure so we cannot undertake to send our veterinary inspector over the road more than once. It is important, therefore, that you make immediate application for inspection if you desite it."—M. Cumming, Truro, N. S.

An Island Cow in the Record of Performance.

In the list of Ayrshire cows that qualified for the Record of Performance by completing their year's test, between the dates February 20th and March 20th we find in the two-year-old class the cow, Rose—31884, owned by Roy W. Bulpit, Cardigan, P. E. I., with a record of 10,795 pounds milk, 4.03 p. c. butter fat, yielding 435 pounds butter fat.

CORRECTION.

In a recent issue the records of several Maritime Holstein cows were given inadvertently as fourteen day records. They should have read "seven day records."

RENNIES "XXX" SEEDS

Our "XXX" Vegetable, Clovers and Timothy Seeds are approved by the Dominion Government for Purity and Germination. Ask your dealer, or write direct for catalogue.

Strongest and Most Stylish-Looking

MARITIME Ornamental Fencing and Gates have *the quality*. There is no gainsaying that. Only *first* quality tubing is used for the gate frames. We could, like many makers, use *second* quality and save *one-third* to *one-half* the tubing cost. We could also use *small* wires and save some more. But we use *large,* strong, stiff No. 9 wire. This wire is more smoothly, thoroughly and *heavily galvanized* than the wire generally used for fence and gate purposes. You know what that means. Strongest, *most lasting,* as well as most stylish-looking. Write for *free catalogue,* showing the different designs, and from them choose a gate you'll be proud of.

Varieties of Grain Crops to Grow.

For twenty six years the Dominion Experimental Farms have been experimenting with grain crops at the various farms and stations distributed over Canada trying to learn which varieties give best results in the different provinces. Not only have the best known sorts produced at other places been grown side by side, but at the Central Farm at Ottawa, new varieties have been bred, and when found desirable, perpetuated and distributed to growers.

For the information of the Canadian farmer the more important results of the season of 1913 at the different farms have been put together in summarized form and issued in Bulletin No. 74. There are included in this some recommendations as to varieties to grow and methods of production to follow that should be of great service to growers in all parts of Canada.

Referring to "Marquis" wheat which was bred at Ottawa the bulletin says, "Marquis produces very large crops, has usually good straw and is more resistant to rust than most of the common varieties." A large edition of this bulletin has been printed so that all who desire copies may secure them by applying to the Publications Branch, Department of Agriculture, at Ottawa.

Butter Parchment.

With the introduction of parcel post the Maritime Farmer is able to offer users of butter parchment particularly low prices. We buy direct from the mills in Germany and are able to give our customers practically wholesale prices, with a slight addition for delivery charges. Our prices include all charges to your home post office. We guarantee every sheet of parchment to be absolutely pure—that is parchment which will preserve your butter from all taint. So much imitation parchment has been offered for "pure parchment" that the public is justified in being doubtful of the stuff that is offered for the 'pure' article. The best parchment is made in Germany and it is from there that the great bulk of the world's supply is derived. The Maritime Farmer has sold millions of sheets of parchment and has yet to hear the first complaint as to the quality of the goods we supply. Prices will be found in our advertising columns. We ask our customers to keep quality in mind when buying parchment. Imitation parchment will ruin butter and result in losses to those who use it.

Good Jersey Records.

Josselyn & Young, breeders of pure bred Jersey Cattle, Rose Bank Farm, Silver Falls, N. B., writes:

Our cows entered in the Record of Performance have made the following milk records: Pedro's Gladys, 9,885 lbs.; Hood Farm Khedive Besrie, 9,272 lbs.; Pedro's Blossom, 8732 lbs.; Molly of Rose Bank, 3 years old 8,589 lbs.; Helen of Rose Bank, a two-year-old, 6,849 lbs. We have young bulls from these cows for sale as per our advertisement.

An Appreciation.

That the Maritime Farmer is appreciated, is shown by the following letter from Arthur Brookes, of the Province of Quebec.

"I received the sample copy you sent, and would say that I was greatly surprised to find so much interesting and instructive reading on all subjects connected with farm matters. From now on, you may count your circulation having an increase by one."

This oven test means bake-day "luck"

If your baking results vary, you may find the reason in the flour. For there is only one way that a miller can assure you constant success. An oven test must be made.

So we take ten pounds of wheat from each shipment delivered at our mills. We grind this sample into flour. Then the flour is baked into bread.

If this bread proves to be the "lucky" kind—high in quality, large in quantity—we use the shipment. Otherwise we sell it.

You buy luck in flour bearing this name.

No need to merely try your luck.

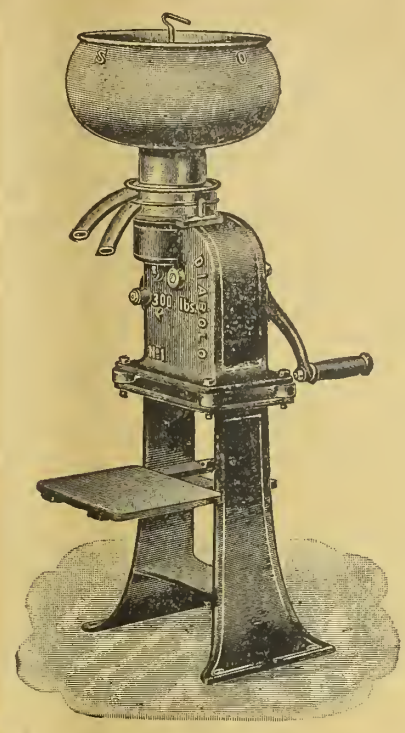
VEGETABLES—Carrots, 50c. to 60c. bus.; Potatoes, 30c. to 35c. bus.; Turnips, 14c. to 16c.; Beets, 45c. to 50c. bus.; Parsnips, $.75 per 100 lbs.

The supply of farm products offering at present is very limited, owing to the condition of the roads. There is considerable oats and hay in store here but very few vegetables, and the prices quoted are only about what they would bring if there were any offering. The same is true regarding poultry. There is some stock still held in cold storage and this is about the only poultry available. Butter is plentiful for the season of the year but the stock of cheese is very limited. Eggs are plentiful and prices are likely to be lower within a few days. Oats are firm and holders are now pushing sales. Hay is dull and the supply is quite sufficient for the market. Loose hay for local use is higher than pressed hay. Meats of all kinds are high. Beef is we think, at a record figure for this market. Pork is easier than it was a short time ago and many think that it will be bought for less money a little later. Reports say that the potatoes have not kept well and that farmers will not have as many for sale as usual.

Rust and Decay

It must be a source of great satisfaction to the farm tool and implement makers to travel round the country in the fall of the year and see that the great majority of the farm wagons and high-priced implements are stored in the open air through all weathers, almost until the snow flies; and then after being well rust covered and rot commencing on the wood work, the tools are housed till needed again, and in the majority of cases are oiled up just before using, and the consequence is broken gears, sweaty horses, and a bill of expense for repairs. A farmer will buy high-grade up-to-date tools and leave them in the barnyard and by so doing shorten their life of usefulness by one-half. The sooner some farmers will learn that paint and oil are cheaper than tools, the sooner they will be in a position to get the full life out of the implements.

THE "DIABOLO" CREAM SEPARATOR



The "Diabolo" Separator is a high grade machine. Its record in skimming capacity has never been beaten. It is simple to handle, easy to clean and light to work. On account of its accurately machined parts it runs noiselessly and smoothly, while wear and friction are reduced to minimum. Fully guaranteed for ten years.

THE KARAKUL SHEEP

IN AMERICA

A BOOK OF 48 PAGES WITH 15 ILLUSTRATIONS

BY

Professor J. Walter Jones, B. A., B. S. A.

Author of "Fur-Farming in Canada"

Price 60 cents, Postpaid

This book gives a thorough going account of the efforts made to introduce the Karakul Sheep into America in order to secure the domestic production of Persian Lamb and Baby Lamb furs and save $10,000,000.00 to America yearly. By means of tables, it demonstrates clearly the present location of the valuable sheep imported in 1913, as well as of the few good ones imported in 1908. The possibilities in this kind of fur farming can be imagined when it is known that a lamb from a Karakul sire and an ordinary Lincoln or Cotswool ewe is worth several times as much for fur as the usual lamb is worth for meat when six months of age. It would be well for fur farmers to read up on the possibility of fur production with animals already domesticated. More Persian Lamb fur is sold yearly than Silver Foxes, Mink, Skunk, and Otter combined.

W. B. KEIVER,

UPPER NEW HORTON. - ALBERT CO., N. B.

What to Spray the Apple Orchard With and When.

APPLICATION NO. 1.

For the first application use one gallon commercial lime sulphur to nine gallons of water if the spray is applied before the buds burst. It has been found that the winter strength of lime sulphur will not injure partly opened leaf buds say one-quarter to one-third expanded. If therefore, the first application is delayed until the buds are bursting or partially expanded, use one gallon lime sulphur to ten to twelve gallons of water, with 2½ lbs. of arsenate of lead. For apple scab, oyster shell bark louse, tent caterpillars, canker-worms, bud moth and cigar case bearers.

APPLICATION NO. 2.

Use one gallon lime sulphur to 37 gallons of water and 2½ lbs. of arsenate of lead and apply just before the blossoms open and just after the cluster buds unfold. This application is for the apple scab and protects the young leaves and stems of the young fruits, with the poison added for leaf eating insects.

APPLICATION NO. 3.

The same as above, applied when most of the blossoms have fallen and the little apples are still standing upright. Do not wait until the little apples have turned downward, as it is then too late. This is the first application for codling moth and is important in fighting the scab, as it is this application which gives clean fruit.

APPLICATION NO. 4.

Use the same as No. 3, and apply a week or ten days later.

Should there be indications of late infection of scab in August or September likely to result from wet cold weather, use one gallon lime sulphur to 36 gallons of water. It is best to apply all four applications. Some times a fifth is necessary. If only three applications are possible use 1, 2 and 3. If only two applications can be made use 1 and 2.

For full information on the insect and fungous enemies of the apple see Part 3 of Bulletin No. 4. For information on "Why We Spray," "Cost of Spraying," "Cost of Spraying Outfit" "Amount of Spray to Use," "How to Spray" and "General Spraying Directions," see pages 30 to 39 of the Report on Horticulture for 1912, or Bulletin No. 2. All or any of these publications will be mailed free of charge on application to A. G. Turney, Department of Agriculture, Fredericton.

NOTE.—If uncertain as to the amount of spray materials required for your orchard, state number and age of trees, distance apart and whether of normal size for their age. Upon receipt of this information the New Brunswick Fruit Growers' Association will know about how much material you will require and will be glad to supply it. Write to A. G. Turney, Secretary Treasurer N. B. F. G. Association, Fredericton, N. B.

Volume 19. SUSSEX, NEW BRUNSWICK, MAY 5, 1914. Number 15.

Meadow Brook Farm, The Home of Good Live Stock

Clydesdales, Hackneys, Shorthorns, Jerseys, and Berkshires

Synonymous with the development of the various resources of the Miramichi Vaalley is the name Snowball. The first Snowball was a developer. The Snowballs of the present day are developers and all the Snowballs in between were developers.

The late J. B. Snowball, one of New Brunswick's best Lieut. Governors was first and foremost in the development of lumbering and agricultural resources of his country and when the needs for better transportation facilities across country from the North Shore to Fredericton, the capital of the province, became apparent he it was who was at the root of the movement and saw it through to a successful finish.

His sons, like him, have carried on the good work and there is hardly a corner of the globe where the products of the J. B. Snowball Co's lumber mills do not find their way. Forth from the dark forests that shade the majestic Miramichi and its various tributaries come millons of feet of lumber each year and as the forests are retreating the development of the rich agricultural areas of Northumberland county is increasing apace. The lumbering and milling operations give employment to a large number of operators and consequently the agriculturists of the county, find a market cose to their own homes, for all the farm produce they can raise at remunerative prices.

We had the pleasure a short time ago of visiting Mr. R. A. Snowball's farm at Chatham, N. B. We had met him frequently at the conventions, exhibitions and fairs. We had seen his well fitted stock, times without number and we had promised John Bennett, the genial Scot, who has charge of the farm and herds to visit him sometime when opportunity offered.

We wended our way from the hotel to the Snowball farm, one mile distant, one winter's afternoon, and had ample time and opportunity to learn a little about the way Meadow Brook farm is conducted.

About forty years ago the site of the present day Meadow Brook Farm was a portion of the green primeval forests. The late Lt. Governor Snowball set men to work at clearing off the woods and converting it into a farm on which he purposed to breed Clydesdale horses and Ayrshire cattle. The former were very essential to him in his lumbering operations. It is now about thirty years since he imported from Scotland "The Duke" his first purebred Clydesdale stallion. Several mares were about that time purchased from Prince Edward Island but the venture did not prove as successful as had been hoped for as very few foals were reared.

The Ayrshires had been purchased merely for experimental purposes and after several years of crossing and recrossing with other breeds not a great deal of advancement or improvement had been affected.

R. A. Snowball and his Prize Winning Hackney Stallion, Model Performer

In April, 1912, a young practical farmer and stockman emigrated from Scotland to New Brunswick. He landed at St. John and carried a letter to Mr. Dunn, then Surveyor General for the province, who got him in touch with the late Governor Snowball, who was glad to accept his services and who put him in charge of his stock. After looking after the stock for one year he was given charge of the whole farm. The young man in question was our genial friend, John Bennett, than whom there is no better stockman in the Maritime Provinces.

Meadow Brook Farm consists of 160 acres five of which are in woods. The remainder is cleared and 60 acres of this area is under cultivation on the four year rotation system of clover, grain, roots and grain seeding again with clover. The clover is left down only one year and it is found to work all right. It gives 30 acres under grain, 15 acres clover and 15 acres roots. Some of the stockmen who visit the Chatham exhibition are well acquainted with the particular brand of clover that is grown on Meadow Brook Farm. We have in mind an occasion when a flock of sheep on their way to the exhibition grounds from the station were lost for a while in the clover aftermath and it required the heroic efforts of some of the Holstein men to rescue them and bring them back again to the fold.

Garton's Regenerated Abundance is the principal variety of grain grown on Meadow Brook Farm and the favorite turnips are Carter's Elephant and Yellow Aberdeen. The Yellow Aberdeen gives good satisfaction. They keep well. They are good for the milking cows and consequently Mr. Snowball likes them better than the Sweedes, as he has kept them until May.

Last fall 8,400 bushles of roots were harvested on Meadow Brook Farm. The turnips are pulled by hand and are left on the field for two or tree days before they are hauled. Mr Snowball finds that by leaving them in the field for a few days they keep better after they are housed. Straw is put through the cutting box and mixed with the pulped turnips for the cattle. This chopped mixture is fed morning and evening. The young stock and cows in milk get a little crushed grain with their chop. A gasoline engine is used for power and the manual work is reduced as much as possible.

Several years ago it was decided to establish a herd of pure bred Shorthorns on Meadow Brook Farm and with this aim in view, the bull calf, Major Lewis, was purchased from C. A. Archibald, Bellevue Farm, Truro, N. S. The heifer calf, Lady of the Lake, was purchased at the same time. The following spring, three cows out of an importation by W. W. Hubbard were purchased at Fredericton.

Two of these cows proved very satisfactory. One of them, "Miss Belle," has given as high as 60 lbs of milk in one day and was fairly persistent. Two cows were also purchased from Mr. Fred Thompson, Fort Lawrence. The progeny of the above mentioned cows and "Major Lewis" turned out to be good stuff.

The next herd leader on Meadow Brok Farm was a son of Miss Belle, the 60 lb. cow referred to. She was carrying her calf, by Darnley Heir, when purchased. This young bull also gave a good account of himself, and as would be supposed, judging the records of his dam, he left some extra good milkers.

The next herd header was Dunrobin Sailor bred by Wm. Elliott, Guelph, Ont The present stock bull is "Gay Archer" bred by Mr. John Guardhouse, Weston, Ont., and he, too, is leaving some extra good calves. The Meadow Brook Shorthorn herd now numbers thirty head.

The Meadow Brook Jerseys are not so well known as their Shorthorns as they are never brought out to the shows; but there are ten pure breds. These were all bred from stock purchased from H. S. Pipes & Son, Amherst, N. S. and there are several good ones included in the number.

The horses on Meadow Brook Farm are pure bred Clydesdales and pure bred Hackeneys. The venture with Clydesdales, as already stated, was not a success at first but gradually the troubles were overcome. Once it was proved to Mr. Snowball's satisfaction that colts could be raised on Meadow Brook Farm he immediately set to work to get some good pure breds. A start was made with pure breds only seven years ago and now the stud numbers twenty-five pure breds, twelve of these at the time of our visit were mares heavy in foal and the younger stock is as promising a lot as one can find anywhere in the Maritime Provinces.

In 1912 and 1913, the Meadow Brook Clydesdales captured the Clydesdale Association Silver Cup for the best showing in the Clydesdale class In last fall's showing, Baron Balgreddan and three of his fillies were included in the winning herd in strong competition, which is a very good recommendation for the progeny of this horse.

Mr. Snowball visited Scotland last fall and there purchased the promising young stallion Baron's Own, by Baron's Pride out of Minnie Ha Ha to follow up the work that has been so well begun by Baron Balgreddan.

Model Performer, the head of the Meadow Brook Hackeney stud, has won more championships and medals than any other horse in the Maritime Provinces.

A quintette of pure bred Berkshire sows adds to the revenue of the farm and makes use of the by-products of the dairy.

To rehearse the winnings of Mr. Snowball's Shorthorns, Clydesdales and Hackeneys in this article would be repeating a lot of ancient history. The herds are so well known that they require no further introduction to our readers. They speak for themselves

A Field of Garton's Regenerated Abundance Oats, on R. A. Snowball's Farm, Chatham, N. B.

and their sleek appearance bespeaks the master hand of a careful master and watchful keeper.

Mr. Snowball advertises in the columns of the Maritime Farmer. The majority of his sales are made through correspondence and it is a good token of intregrity between man and man that not a single complaint has gone back to Mr. Snowball in regard to any stock he has ever sold.

Mr. Snowball takes an active interest in the agricultural institutions of the Maritime Provinces and has filled important positions on the directorate of the Maritime Stock Breeders' Association for many years. He is a busy man in connection with his various industrial operations but he is never too busy to say a good word for farming and stock raising and in this connection he has been particularly fortunate in having such men as John Bennett and Don McIntyre, men who "know how," associated with him on his staff.

Important Relation of Cow Testing to Dairy Herd Improvement.

In studying dairy cattle, we must bear in mind that the catte, as we have them to-day, have to a large extent been brought to that state through breeding and selection by man About the beginning of the eighteenth century, work in systematic breeding was commenced, and the different breeds have originated through selection and the use of strong prepotent sires which have arisen from time to time, and which have had the power of impressing their qualities upon their offspring We must bear in mind that the original function of the cow was to maintain herself and to produce only enough milk to feed her calf. She has been taken out of that natural condition and developed into more or less of a machine—a machine the function of which is to consume food in a crude state and manufacture that food into milk, a highly finished product The dairy cow has, therefore, been raised to a comparatively high state of excellence, and the natural tendency is downward. This tendency must be counteracted by breeding and selection on the part of the farmer.

Any scheme which has for its object the improvement of dairy cattle must provide for a study and record of the performance of the individual cow as well as deal with the management of the herd, including its care and feeding. To be a successful breeder, it is necessary for the breeder, or dairy farmer, to be a good judge of stock in order that he may breed toward a certain type or ideal which he has in mind and toward which he is working. He must be a judge as to the strength of constitution, the feeding capacity, breeding capacity and their conformability to his ideal. But behind this it is essential for him to know just what each and every cow in his herd will produce for the amount of feed she consumes.

As a means of determining the worth of the individual cow, we have a Cow Testing Movement. Every dairy herd is made up of some cows which are better than others. Many herds contain cows which are simply boarders on the farmers' hands. One reason why theh poor cows are not more readily recognized is that the cost of feed grown on the farm has not been taken into consideration. These feeds have a market value and should be charged against the cow. If she will not pay a profit an effort should be made to get cows that will.

Cow Testing Associations.

Such an association is simply composed of men who agree to keep records of their cows. This involves the weighing of the milk from each cow at both milkings on at least three days each month, viz., 10th, 20th and 30th, and the taking of samples at the same time as the weighing is done. These samples are preserved until the end of the month and then tested by the Babcock test for the percentage of butter-fat. Knowing the amount of milk produced and the percentage of butter-fat, it is quite easy to find the number of pounds of butter-fat produced by each cow.

The requirements for testing are simple. Each member must furnish himself with a spring scale, a sample bottle for each cow, a sample dipper and a box for holding the sample bottles. The Dairy Division of the Department of Agriculture, Ottawa, agrees to furnish all record sheets, preservation tablets, sulphuric acid for testing, and to pay for having the testing done, providing it is done by a competent person.

It is quite possible for a farmer to have his own Babcock tester and do his own testing, but it is most popular to have this done by one man for the Association. A cheese or butter factory is a natural centre for an association, but in sections where there is no factory it is quite possible to make other arangements.

It is practically useless for a man to begin this work unless he is willing to continue for the whole year or the whole period of lactation. One year's work simply shows a man where he is standing. Having obtained that knowledge, the farmer is in a position to weed out the poorest cows, those which do not pay a profit, and then carry on a system of improvement through the use of a good pure-bred bull. The sire is truly the head of a herd, and canot be too carefully selected from a strain which has a record for large milk production. It should be borne in mind that we have scrub pure-bred as well as scrub grades. By the use of a pure-bred sire we introduce with each generation more pure blood into our herd, and if this is done with thought and judgment, improvement is bound to follow. It is not enough, however, to purchase an animal with a pedigree, and that brings us to the question of "What is pedigree?"

Pedigree may be said to be the history and blood history of ancestry of the animal in question, which means little in itself unless one knows something of that ancestry. The presence of the paper in itself gives to the animal no additional value, and the purchaser should demand some record of the performance of the ancestry of the animal he is about to purchase. This is not an argument against pedigreed animals but rather an effort to place performance ahead of pedigree.

Breeding fads have to some extent detracted from the utility of animals. Some breeders have been paying rather too much attention to points which may receive attention in the show ring, and have disregarded, in some measure, the productiveness of the animals. In breeding, utility should receive consideration.

During the last few years an effort has been made to get dairy farmers in Canada acquainted with the cow testing work. In some sections considerabe interest has been shown and in cases where this work of selection and breeding has been followed out much improvement has been noted.

Dairy Record Centres.

I have mentioned the cow testing associations. We have also record centres, of which there are two in New Brunswick, at Sussex and St. Josephs. The recorder in charge of such a centre gives his whole attention to record keeping in that section, keeping records of the cost of feed as well as the production and handling of seven hundred cows. He is, at the end of the year able to place some valuable information in the hands of the farmers in that section. While we have two such centres in the province, there is room for more, and the location of other centers will depend upon applications which come from the farmers themselves.

The dairy farmers of New Brunswick would do well to give serious consideration to the offer that is being made by the Dairy Division regarding cow testing work. It is an effort to place in the hands of the farmers that from which they may, by selection, and subsequent breeding and selection, improve their stock and increase their profits. If the work is carefully followed out, the result will not be disappointing. It is a great step toward putting dairy farming on a busines basis, and when this business is carried on as a business, great progress will be made.—H. N. Flewelling, Sussex, N. B., Recorder, Sussex Dairy Record Centre.

Now is the time to get rid of your rheumatism. You can do it by applying Chamberlain's Liniment and massaging the parts freely at each application. For sale by all dealers.

Snowball's Prize Winning Quintet of Clydesdales at the 1913 Halifax Exhibition. Baron Belgreddan heads the list

Economizing Time and Labor

We hear much today about scientific cooking and scientific farming. Offices and stores are everywhere using scientific management, that is, everything is planned and arranged so as to get the best results in the shortest time. It is now the household's turn to be revolutionized, and this can be done in the same way—by systematizing and planning the work in advance. Of course one cannot lay down a general rule that will apply to all households, because every home and family are different; but, let every housekeeper plan her own work and apply the methods that suit her conditions best.

Every one knows, however well the work is planned, there are many interruptions, especially where there are children; therefore, one should allow for interruptions, just as a storekeeper allows for profit and loss.

It is not because the housekeepers work is so hard or difficult that she finds so little time for rest or recreation, but because of the endless little things that have to be crowded into each day. The woman or mother, today, who works from early morning until late at night, taking no time for rest or mental or moral culture, is neglecting the most essential part of her work as a housekeeper. But, you say, "How can we find time with so much to do and so many to work for?" Only by leaving something undone.

"Labor with what zeal we will
Something still remains undone;
Something unaccomplished still
Awaits the rising of the sun"

Make up your mind to do first, only the things worth while. Find out what can be left undone without affecting the comfort or happiness of your family. Suppose there was no Sabbath: would not the housekeeper find just as much to do with seven days to work in as she now does with six? And again, suppose there were two Sundays instead of one in each week, the work would have to be arranged so as to rest two days out of every week. Therefore, if the housekeeper would think it extremely necessary to take an hour for rest each day, or an afternoon or two each week for social intercourse, the work and the world would go on just the same. Everything that lightens our work and gives more time for recreation and rest, is an economy—then let us think of a few ways in which we can economize "Time and Labor."

The most important part of the woman's work is the cooking and getting meals The parlor may go undusted and no one grumble, but let a crowd of hungry children, or what is worse, a hungry man, come in and find no dinner ready—that is a different story! Economize space whenever possible, especially in the kitchen. The nearer the kitchenette or pantry,, stove and table are together, the less steps and work it requires to cook and get a meal. Have castors on the kitchen table and move it near the stove, sink or window, as it suits your special work best. There are so many inexpensive utensils one can buy for lessening the work in the kitchen. Have everything to work with, but no more than necessary; as the more one has, the more there is to keep clean and in order. Alterations can be made in almost every kitchen, making it feasable for more convenient work, and many of these can be made by the housewife or the man of the house himself. A rack nailed against the wall over the table or sink will hold all the kitchen knives so one will not have to sort over a whole box full to find that particular paring knife one wants. Racks for dishes, sauce pans, etc., are also convenient. Old chests can be converted into boot-boxes or drawers to hold kitchen towels, aprons, etc., and will serve as a seat besides.

Did you ever stop to think how many unnecessary steps and movements one takes in setting and clearing the table? So many will make trip after trip from dining-table to kitchen, carrying a few plates or saucers at a time, while all might be piled neatly together and carried out on a tray, one trip taking them all. Did you ever stop to think how many unnecessary movements one makes in washing dishes if the draining pan is on the right of the dish pan? For instance, you take the dish to be washed in your left hand, with dish washer in your right; you wash the dish, lay down the dish-washer, take the dish in your right hand and lay it on the tray, while if the tray were on the left side only one movement would be necessary. All this seems of small account, but when you think of doing it three times a day and 365 days in the year, it means a lot of lost energy

Then next to cooking comes the washing and ironing. This is something that cannot be left undone. There are so many labor-saving devices that lessen the work of wash-day, that even it can be made interesting. Perhaps the first of these to be considered is the washing-machine and of these there are many kinds on the market. Perhaps the revolving kind is the most used. But there is also the steam washer, the suction and the vacuum washers—all of which are satisfactory and so inexpensive are within the reach of all homes But any machine that will wash a whole tub full of clothes at one time, doing away with the time it takes to wash each piece separately, is an economy of not only time, but money. In order to get the best results from any washer the clothes must be sorted and soiled spots treated with soap and put to soak, and the washing powder or soap used plays an important part. By using Naptha soap one can do away with the boiling of clothes and thus save much time and steam.

A high stool is a great comfort to many housekeepers. One woman utilized a high chair with an arm off for this purpose and found it saved her feet so much, especially when ironing. So many things need not be ironed; the sheets, pillow-cases, underwear, etc., can be neatly folded and are fresher and more healthy if not ironed. Besides these labor saving devices there is the dustless duster and the sweeping powder that will eliminate all dust. The vacuum is also getting to be within the reach of the modern home. Every housekeeper can clean, scrub and dust, but the main thing is to keep things clean after you get them clean. Clean as you work—have a place for everything and see that everything is kept in its place. Teach your children and other members of your family to do the same, but above all, arrange your work so as to have more time for rest and to be sociable not only with your own family but to your neighbors. Have an interest outside of your own home and thus broaden your ideas, for

"Rest is not quitting the busy career
Rest is the fitting of life to its sphere."

—Mrs. Chester Keith, President of the Corn Hill Branch of the New Brunswick Women's Institute.

FOR HOME AND COUNTRY

The Maritime Farmer has been asked to open its home columns as common mouth piece for the Women's Institutes of the Maritime Provinces..The request has been granted and Miss Fraser, Miss Winter and Mrs. A. E. Dunbrack, Supervisors of the movement in Nova Scotia, New Brunswick and Prince Edward Isand have consented to contribute artices, reports, etc., for the benefit of the home makers of Maritime Canada.

Results of Spraying in 1913

Mr. President, Ladies and Gentlemen:

As some of you know,I am more or less a beginner in the art of raising apples, so that I feel considerable diffidence in speaking on the subject before the members of the N. S. F. G. A., some of whom have taught me most of the little I know about apples and apple growing.

Fortunately for me, however, I was only asked to say a few words on my methods of spraying, etc., and the steps followed to obtain the crop I had last year. This I will endeavour to do to the best of my ability.

Of course, I can only attribute the fact that I was fortunate enough to have fairly clean apples last year to spraying but spraying, like the smell thereof, covers a large amount of ground and I may say that I began my last year's spraying three years ago and began it with an axe. That is to say, my trees were too cose together for spraying properly, being twenty feet apart each way and all grown in to one another. I therefore, cut out practically every other tree in every other row and then headed back a lot of old trees that were too high. These two preparatory measures not only made the trees much handier to work among but also let the sun and air to the trees and soil.

I, so far, have always managed to get my orchards ploughed in the fall, using for this purpose a sulky plough and I plough in strips leaving the trees standing in a strip of sod about five feet wide which, apparently, allows the trees lots of feeding room and at the same time cuts down the cost of plowing very considerably. It is not a pretty method but, though there is a lot of pleasure in growing apples, few of us raise them merely for fun or ornament.

One reason why I like fall ploughing is that it buries most of the leaves and with them a lot of black spot, I imagine. It also gets the cover crop rooted in time for next year's growth of the trees.

The ploughed land is kept regularly cultivated from early spring to the beginning of July

My pruning has been done rather severely, as I am convinced that good apples cannot be grown without lots of sunlight all over the trees and, moreover, it is a much easier task to spray thoroughly when a tree is fairly open and one can see what one is doing

May I say here, that in my opinion, the so-called spraying does not get all the credit it deserves because a great many growers merely spray when they should wash their trees. The former is, of course, all right with the Bordeaux mixture but I am convinced that, except for waste, it is impossible to put too much Lime and Sulphur on a tree As to waste, it is more profitable to waste Lime-Sulphur than apples. Spot can grow on a sprayed apple unless all parts of the apple are covered and, if it grows on the stalk early, will cause apples to drop. For fertilizer, I use about 400 or 500 pounds slag per acre every year, put on in the middle of winter and sow one bushel per acre of vetch the first week in July. This not only gives me a most satisfactory cover crop, as it apparently grows well in any weather, wet or dry, but also furnishes an abundant supply of nitrogen when ploughed under in the fall. The young trees get practically the same treatment with the addition of a few forkfuls of barnyard manure to each tree. My land, I had better explain, is fairly heavy and does seem to need any potash at present.

In order to secure pollenization of the blossoms I keep a few colones of bees and intend to keep more as they are very little trouble.

So much then along general lines and I will now, with your permission, say a few words about last year's work in particular

In 1912, I came to the conclusion that I could not get the results I wanted with a hand pump so I bought a power machine with a 2½ h p. engine and 200 gallon tank which is easily handled by two horses and enables me to do the work not only much more satisfactorily but in much less time and with much less trouble.

Working this pump at a pressure of 160 to 175 pounds makes it possible to drive the spray thoroughly into the trees and soak them well.

As you will remember, trees came along very slowly last year, so much so, that I was afraid to wait for my first spray as long as I might have otherwise done for fear lest a warm wave should open the buds suddenly. I accordingly put on my first spray fully ten days before any of my neighbors and had quite a long rest from this work before the blossoms fell. For the first spray I used one gallon of lime-sulphur to thirty gallons of water.

The second spray was put on at the usual time, that is to say, each variety was sprayed when practically all the blossom of that variety had fallen. Strength of spray, 1 to 40. A third spray, 1 to 40, was put on about ten days and, in view of the wet weather and consequent danger of spot, I put a fourth spray, about three weeks after the third, on such varieties as Gravensteins, etc, that I thought most likely to be infected. No poison was used with the fourth spray With the other three sprayings I used neutral arsenate of lead at the rate of 2½ pounds to 40 gallons of spray solution. This was, I think, hardly strong for the tri-plumbic arsenate and, previously, I had used the same quantity of Swifts aresnate and may say that I never seen any injury done to apples by spray russetting.

I do not count on spraying so often every year but you will remember that conditions last year were peculiarly favourable to fungus development. I was determined to test the effectiveness of spraying as fully as possible and to give it every chance and it was indeed fortunate for me that I did so. It was a very significant fact that the best crops, in both quality and quantity, per acre in my neighborhood were obtained by men who had power sprayers. Hand sprayers brought fair results and men who did not spray at all did not have to buy many barrels for their apples. Moral, spray hard.

There are a few points I should like to mention in favor of spraying though I imagine that, after last year's experiences, very few men will have any doubts as to its advantages

First, I heard a great many complaints of poor foliage during the season but my own experience was that I never had such fine, healthy, dark green eaves on my trees before, so much so that I felt more like thinning the leaves than the apples.

Second, I had a very striking proof that my crop last year was due almost entirely to spraying On the west side of one of my orchards I have three rows of Ribston trees which stand in a rather damp place. Owing to the softness of the ground at the time of putting on the first two sprays I was not able to take my machine round the two further rows and only the first row got sprayed. The ground was equally damp round the first row but I was enabled to bring the machine near enough to take the hose round the first row with the result that I had here one row of trees heavly laden with fine, large, clean fruit and the other two rows had practically no apples and what there were, were poor, misshapen and very badly spotted. Most of us have cause to know that a good many of the early apples were lost last year from not keeping after being put in the warehouse; but I have noticed in our warehouse that the best sprayed apples kept far better than those not so well sprayed.

DRAINAGE

Well, we have had a good old fashioned winter; It came early and stayed late. We heave a sigh of relief as we see the last dregs of snow and ice disappear from the fence coroners. By the time this issue of the Maritime Farmsr reaches its readers we trust the weather man will have warmed up both air and soil so the farmers can get busy preparing the soil to receive the seeds. Farmers who did not rush their work last fall and get the most of their ploughing done will be handicapped very materially in getting their crops started in good season. Again, some fields will be ready for sowing or planting many days before other fields on the same or adjoining farms are ready. In nearly every case lack of drainage is the real cause of this tardiness. It would be a good idea for you to mark the wet spots in your fields when you are working them and later in the season, when work slackens somewhat and you are looking for some job to keep you out of mischief, just open up a few drains through these marked areas. It will pay you handsomely to do so and when you are again obliged to operate in these fields your work will not be hampered by springy spots.

THE POWDERY SCAB

We would again call the attention of our readers to the articles in this and preceding issues of the Maritime Farmer on the question of powdery scab. The hearty co-operation of every reader of the Maritime Farmer is asked for in the fight for the eradication of this potato disease from the Maritime Provinces. You can do a great deal for this movement by complying with the rules laid down by the respective departments of agriculture. You can also assist by taking an interest in your neighors' attitude on this question. Talk it over with them and use your best influence in showing them that it is to their own best interests to give the eradication movement their heartiest co-operation. Man can not live to himself alone in this question. Each and every one must go a step beyond his own borders in order to accomplish the results that those who have the best interests of the farming populace of our provinces at heart. This is a case where it pays one handsomely to obey and do what he is asked to do. There are a great many little foxes that eat the vine. Powdery scap is one of the big foxes that cut down the farmers' profits. Do away with it.

If you are free from it now watch the various avenues of affection as you would watch for an enemy. Do not let it get a foothold on your property. If you are unfortunate enough to be one of the farmers on whose farm the scab has already found a footing, do not rest until you can say "I have conquered it. I have driven it from my premises." You can do so if you obey those who have made a study of the question and now have the work of eradication in their charge.

THE COMMON SCAB.

The common Scab of the potato is unsightly and while it does not cause the damage that is attributed to the Powdery Scab it depreciates the selling value of your potatoes. No one wishes to buy scabby potatoes. If you do not grow scabby potatoes you will have not scabby potatoes for sale. The scab of potatoes is a fungous growth which shows itself in a rough and cankerous appearance on the surface of the tubers. A great amount of work has been expended on this disiase and still no preventive is known if the land is inoculated with the trouble.

Of a large number of methods used for treating the seed potatoes, soaking them in a solution of formalin, one pound to thirty gallons of water for two hours, is the most effective. Soak the potatoes before cutting them, and if they are not planted at once spread thinly to dry. This treatment will kill the disease on the seed, but scab can live in the soil for many years without a known host, Lime, wood ashes and barnyard manure aid the growth of scab, while sulphate of ammonia, muriate of potash, acid phosphate and dissolved lime render the soil less favorable to the disease. If you have never treated your seed potatoes for scab do so this year and watch results. You will be delighted with the smoothness of the tubers. If you have used the treatment once we know you will do so again.

GET RID OF SMUT

Do you remember the number of black smutty heads that appeared in your grain fields last year? Did you ever stop to think of the precentage of your grain that is yearly damaged by smut? Did you ever stop to think of the great reduction smut-thus makes in the income from your fields and labors? Did you ever stop to think that these losses could be avoided by a little extra inexpensive efforts on your own part?

You ask how can I do it? Well, here you are; this is the way other readers of theMaritime Farmer handle the proposition and why not you. Now is the time to do it before you sow your grain.

This is the time of year to ensure against smut in grain. There is no reason why smut losses should be the case if the seed is properly treated.

The best known and most widely used substance for treating seed grain is formaldehyde. This can be bought in drug stores at a moderate price. One pint is put into forty gallons of water, and the seed grain is then dipped in the mixture in such a way as to wet the outside of every kernel. Or the formaldehyde solution may be sprayed onto the grain, while spread upon the floor-- it being raked or shovelled over frequently and then covered with old sacks.

A few precatutions should always be observed.

(1) Formaldehyde varies in strength and, if there is doubt as to its quality, a sample of it should be sent ts the chemist of the Experimental Farm, in order to determine its exact strength.

(2) The sacks in which the grain is treated should first be cleansed by boiling in water, or by washing in a strong solution of formaldehyde.

(3) Everything which the grain touches after having been treated, sacks, seeder, etc., should be very thoroughly cleaned with a strong solution of formaldhyde (1 pint to 10 gallons of water.)

(4) If the seed is kept for some time after treatment; do not let it sprout or mold; do not let it freeze while swollen after treatment; allow for the swelling of the seed, if you sow the grain soon after treatment, by planting more per acre.

This formaldehyde treatment will prevent stinking smut of wheat, covered smut of barley, and smut of oats. It also prevents flax-wilt if the treated seeds is sown on land which has grown no flax for five or six years.

SHEEP DIPPING.

Do you dip your sheep? If not we dare say at shearing time you found your sheep infested with vermin. Did you ever watch a vermin infested flock of sheep and see how restless they act? How they rub themselves against fences, feed racks etc! How they bite at their side and bull the wool until in some cases, they become almost denuded! How they suffer! Suffering, as they do, they cannot thrive, and spring finds them in an emanciated condition. The loss at lambing time is greater than it would be if the ewes were strong and giving a bountiful supply of milk. Why not dip your sheep this summer and thus give both ewes and lambs a chance to thrive? The process is quite simple. If you follow the following rules you cannot go wrong in this respect. See that the preparation is properly mixed and the correct quantity of water is added. Don't guess at it.

Never hurry the dipping, always take care that every sheep is kept in the bath full time; never less than one minute nor more than two minntes.

Have the bath well and regularly stirred up from the bottom always before beginning to dip, and whenever any stoppage occures.

1. The best time for dipping is from one to three months after shearing.

2. The sheep should not be over heated or thirsty at the time of dipping.

3. If the sun is very hot, it is better to have the draining pens under shade.

4. If the nights are cold the dipping should always be stopped soon enough to allow the sheep some time to dry before sunset.

Never allow drippings from the sheep to fall on anything they are likely to eat. If rain comes on before they are dry, keep them off pasture until after it has ceased.

When dipping twice, allow an interval of not less than twice or more than eighteen days between the dippings.

Unweaned lambs should be kept apart from dipped ewes for a few hours after dipping.

All wash that is left and anything wetted with wash should be kept out of reach of all animals.

If there is only a small flock, expensive preparations are not necessary. A large hogshead cut in two will answer the purpose of a dipping tank very well and there are so many sheep dips on the market, all of which are quite effective and carry directions on their containers so that one cannot make a mistake if he is at all careful.

Brain Versus Brawn in Improved Agriculture.

Editor the Maritime Farmer:—

The difference between the farmer of the past and the farmer of the present day, is every year becoming more marked. The farmers of thirty years ago were men who prided themselves on the fact that they relied on nothing but their brawny arms. It is true that at times they might get an idea from their neighbors, but such were looked upon with suspicion. All improvements were thougt to be frivolities and unfit for the consideration of practical men.

In those days the brawn was the chief requirement of the farmer. But the man who would be a succesful farmer of the present day wil require a far greater supply of brain power than of anything else.

The case of two brothers who had charge of a farm in this county would well illustrate the difference. The younger brother traveled over nearly all the States and Canada working at nearly everything from lumbering to farming, always acquiring a fund of information and experience. He also saw that it was the man who had the brains and used them that commanded the highest wages. The men who simply used the arms were those who got the smalest pay. Among the farmers he saw that ways and methods were changing and that the men who used pure bred stock were the men who seemed most contented with their lot.

After some years he decided to return to the farm. He found his brother in the same place, following the same methods, and using the same cattle as did his father before him. He plowed his land with a single plow, harowed it with the old style clog harhow and sowed his grain by hand. Such methods were sure to bring nothing but failure or at the best, but very poor results. The cattle were but scrubs of every shape,, form and coloring. They fed on sun-parched pastures among stumps and rocks and like their owner they seemed to have lost all interest in the things of this world.

The younger man thought that if he had the management of the farm he would be able to handle things better After a while the older man gave over the farm to his brother and went to the nearest town to work in the mines. Here he received about fourteen dollars per week which he said was better than farming. And no doubt in his case it was as some men are born to lead and others born to be led, so also are some men born to farm and others to work for a boss.

When the yonger man took over the farm he found everything in the same condition. The hog houses were veritable "pig pens," leaky and unfloored; the yards were covered with mud and water a foot deep The poultry roosted in a corner of the cow shed.

But in a year's time what a change had been wrought in the appearance of the farm. Instead of tumble-down heaps of rails, the fences were of wire, neatly stretched on concrete posts. The dweling house had received a coat of paint and the addition of a verandah greatly added to its improvement. The old collection of barns and outbuildings of every description were torn down and modern and up-to-date buildings substituted. A barn, 40x90 feet was the accommodation for cattle, storage of hay, etc., was built and alongside two concrete silos were put up. One of these he keeps for helping out the summer pastures. It is built slightly different to the other which he fills for feeding during the winter months. The summer silo is taller and of less diameter than the other. In summer the silage exposed to the air will spoil far quicker than in winter, thus the smaler surface of exposed silage in the narrower silo means a smaller loss from rotting.

We were seated on the verandah of his house while he talked to us of his crops and rotations and catle. It was evening and the sun was going down; away to the eastward beyond a stretch of pasture and meadow land, the last rays of the sun shone on the tops of a grove of maples like a flood of fire. Truly it was a scene that would bring joy to the heart of any one who should see it. Isaid so to my host; he smiled and said: "my brother, Jim, could see no beauty in it; but no doubt, it was because on this side of the maples was overgrown with scrub spruce.

Mayor Todd

Champion Standard Bred Stallion at the 1913 and 1914 Maritime Horse Shows. Owned and exhibited by Hammond Kelly the well known horseman and trainer, Charlottetown, P. E. I.

"Well I cleared that away and it is first class pasture to-day," he continued. "I am going to have a good sugar bush there in a few years. This year I had five hundred trees taped. I bought an eveporator and metal poles on which the cans hang; they keep out the water and drt. This insures a product as pure as it is possible to have. My outfit has paid for itself this spring. See there," he continued, pointing towards a field of first year alfalfa, "that is something the farmers here do not yet apreciate the value of. I saw it out West and determined to try it here. It looks as if it was doing well." "In what part of your farm do you think the greatest improvement has been affected?" I asked.

"I believe I have done beter in the improvement of the catle than in any other branch. When I first began, the catle were all the poorest of scrubs. I set to work and bought a good Holstein bull. He was registered in the herd books and behind him was a pedigree a mile long. It cost me a pretty stifl price too. The farmers around here laughed at me until their sides ached. But I had seen too many of the results of pure bred cattle to give any attention to their smiles. The next fall I bought two registered Holsteins, two year olds, and a bunch of the best calves I could get among a half dozen herds. There were twelve head in all and they cost me something around one hundred dolars apiece. After this my neighbors began to see Iwas in earnest and they began to ask questions. They saw the amount of milk my cows gave and their size and uniformity. I discarded the whole lot of scrubs and they hardly brought the price of two good cows. I was up to my ears in debt, but the sale of three bulls from my best cows soon got me out of the hole. My herd have paid for themselves ten times over. They are among the best in the province. I believe in feeding my cows all they can eat in winter. I give them a ration something like this: corn silage 30 pounds, mangles 12 pounds, clover hay 8 pounds, straw 6 pounds, and a meal mixture composed of oats, 3 parts bran 3 parts, oil cake, 2 parts, and corn, 4 parts. This is ground up; I feed 4 pounds per cow and one for every 5 pounds of milk she produces. I find it is beter to give this meal a sufficient part of the ration in the morning and afterwards to give the parts which are less nutritious so they will do better when they go to the less inviting feeds as a pasture rather than a duty.

"When on pasture they get an allowance of grain and in July when the dry weather causes a shortage of grass I feed my cows corn silage from the summer silo. I do not feed for extraordinary milk records, as I prefer to raise the average production rather than an exceptional yield from a few individual cows. I always weigh the milk and for this I find no better scale than the dial-faced, spring balanced with movable pointer.

"I raise all my calves. The females I keep till two years of age and what I do not need for building up my own herd I sell at a figure that means a good profit. The man who says there is no money in dairying is the man who has not the ability to make money at anything."

Next morning when he took me over his premises I found the conditions just as he described to me; everything was in apple-pie order. I found his barn with cement floors, modern stanchions and a first class litter carrier installed. Nearby was the sheep barn. It was 40x40 feet, large enough for one hundred sheep. "You see," said my host, "although I have only twenty-five pure-bred sheep now, I have built my barns not only for the present but also for the future." It also was built with an eye to convenience in feeding and cleaning. The feeding racks were so placed that they could be filled from the loft, which was used for storing hay. The doors were wide in order to avoid injury to the ewes in case of their being frightened and stmpeding.

"This building," said my host, as he led the way to the hog house," is the one in which the greatest change from the old type to the new may be observed. It, like the others was built with concrete floors No wood was used in the manger except in the sleeping platforms which were of inch board built and foot from floor. In all I was one of the best equipped and best managed farms in the county; while three years ago it hardly provided a living for one man and his wife.

Such is the difference between the methods of to-day and the methods used by the farmers of the past. Then it was a question of brawn and muscle while now it is the man with the brains that is the farmer of to-day.

The man who believes in modern improvements and labor saving devices and knows how to properly use them is the man who also believes in the superiority of pure bred cattle over grade. This the man who will make money out of a farm that a man who of the old school would fail on. The brawn of yesterday is replaced by the brain of to-day. And the college trained boy of to-day will be the successful farmer of tomorow.—John H. MacDonald Cape Breton County, N. S.

* * *

Editor's Note: The writer of the foregoing article has evolved a dreamy ideal which we would like to see put into practical realization on many farms in Cape Breton. We are not acquainted with the writer but he has given a good story. We should very much like to make the acquaintance of the young farmer referred to. We would be particularly well pleased to see the fields of corn from which the silos had been filed. The editor of the Maritime Farmer is always pleased to hear of progressive movements in the county he knows so well.

The Powdery Scab.

Editor the Maritime Farmer:—

The attention of all those growing potatoes for export trade is called to the immediate necessity of taking some action to prevent the loss of a large part of their export trade. Owing to the discovery of Powdery Scab in different parts of Canada, a quarantine was established against the Dominion by the United States, whose example was speedily followed by Bermuda. Though our principal market has not up to the date of writing taken a similar action, the fear that this might be done will no doubt have a serious effect upon this spring's planting. Growers wil be relieved to know, therefore, and there is a possibility that this embargo may be removed as far as Bermuda is concerned.

A careful inspection to determine the prevalence of this disease in Nova Scotia, has lately been conducted by the Dominion Division of Botany, which shows that it is not at all common in this Province, and in particular Kings, Colchester and Hants Counties are also free from it, the only cases reported being two from Burlington, one from Harborville and one from Black Rock. From the remainder of the Province we have one record from Yarmouth, a number from Cumberland a unmber form Guysborough and one from Antigonish. The fact that the chief potato producing centres of Nova Scotia are practically free from the disease has been brought to the atention of the proper authorities in Bermuda. As a result of the representations made, it is probable that the embargo on our potatoes may be removed under certain conditions. Though not giving a definite decision, they stated that arrangements could probably be made to allow the importation of potatoes from this Province, provided such potatoes were accompanied by a certificate giving a guarantee that each consignment of potatoes for shipment was inspected by a Dominion-or Provincial inspector and were,

Results of Spraying in 1913.

(Continued from page 533)

Lastly, many of you probably saw at the Windsor Exhibition an exhibit of apples, some of which were sprayed with Lime-Sulphur, some with Bordeaux and some not sprayed at all and you must have noted for yourselves the marked advantages of spraying, especially with Lime-Sulphur. The difference between the sprayed and unsprayed fruit was very marked but by no means exaggerated in that exhibit as I should think most unsprayed apples were far more spotted than those sown.

To sum up then, I attribute the fact that I had a fair crop of fairy clean apples last year to plenty of air and sun among the trees and lots of Lime-Sulphur but I very much doubt whether, in a year like last year, it is possible to secure good apples without a power sprayer except possibly on very young and small trees.

Variety	% of 1's	% of 2's	% of 3's	% of Specls.	% of Culls
Gravensteins	31	19	27	11	12
Ribstons	40¼	26	21½	6½	5
Blenheims	33	31½	27	—	8½
Kings	48½	28½	10	4¼	8¾
G. Russets	68¼	10	7¾	3½	10½
Ben Davis	33¼	20½	20	8	17¾
B. Pippin	65	5	5	15	10
Nonpareils	74¼	10¾	7	2	1½ culls 4½ shrinkage
Baldwins	25¼	18¾	28¼	5¾	22

Barrels were not filled tight in the orchard for fear of bruising the fruit and cullage above accordingly includes a considerable amount of slackage and shrinking.

Above figures are "free run". Some of my Baldwin trees (since cut out) were still to much grown together to spray properly and hence pack was poorer than for any other variety.—Paper read by Lesie Wiltshire, Round Hill, N. S., before the N. S. F. G. A. at Kentville.

Cow Testing at Scotsburn.

Harry R. Brown, Wallace Bay, N. S. the subject of our sketch was only eleven years old when, in 1900, he participated in the MacDonald-Robertson Seed Grain Competition. At the close of that competition in 1903, he continued the work of seed selection in the Canadian Seed Growers' Association, thus becoming practically the pioneer Seed Selector in Nova Scotia. He was also one of the first members of the Canadian Seed Growers' Association to take up the work of potato improvement in the Maritime Provinces.

Mr. Brown graduated from the Nova Scotia College of Agriculture, Truro in 1908 and since then his time has been about equally divided between the home farm and work for the Provincial Department of Agriculture, as a judge of field crops competitions, as judge at exhibitions and as an inspector under the Insect and Pest Act (Brown Tail Moth and San Jose Scale) His work on the farm has been marked with success and he has given the utmost satisfaction in connection with his work for the Department of Agriculture.

Mr. Brown has recently been appointed Inspector for the Cow Testing Department of the Dairy Division, Ottawa. He will have charge of the Scotsburn Record Centre and his headquarters will be at Wallace Bay.

HARRY R. BROWN

The Scotsburn Record Centre is one of the most important in the Dominion. During the month of February, 1914, out of 28 centres reporting it stood first for number of herds, third for number of cows and this number is rapidly increasing. The number of herds is an indication of the general interest that the members of the Scotsburn Record Centre are taking in the cow testing work. It shows the men of that district are alive. With Harry Brown to keep tabs on their work we believe matters will go along smoothly and that the numbers of those who take an active interest in separating the workers from the drones in the dairy will rapidly increase. "Where the didder is there are the diddings."

BIG ROOTS HEAVY CROPS

Results are never in doubt if you sow

Steele, Briggs' Seeds

With favorable conditions they will positively assure you of big crops and big roots.

For your root crop we strongly recommend the following:

Steele, Briggs' "Royal Giant" Sugar Beet.

Steele, Briggs' "Prize Mammoth Long Red" Mangel.

Steele, Briggs' "Giant Yellow Oval" Mangel.

Steele, Briggs' "Giant Yellow Globe" Mangel.

Steele, Briggs' "Giant White Sugar" Mangel.

They produce the heaviest crops of the best kind of food for cattle.

Does it Pay to Advertise in the "Maritime Farmer?"

For an answer to the above question just read what B. V. Millidge, the well-known Jersey breeder, St. John, N. B., has to say in a letter dated April 29th, 1914:—

"Some time ago I sent you a post card asking you to take my advertisement out of the Maritime Farmer, as I had sold the heifers. I also requested you to send me your bill. Did you receive it? I am getting letters every day about the heifers and it keeps me busy telling the people that they are sold. I will have another ad. for you soon. The Maritime Farmer is a great advertising medium. I received inquiries from all over New Brunswick, Nova Scotia, Prince Edward Island and Newfoundland. Please send me your bill and cancel the ad."

Editor's Note.—Mr. Millidge's ad. was cancelled as per his request and the subsequent inquiries must have come from readers who preserve files of the Maritime Farmer and order goods from advertisers in past issues.

Summary of Results of Experiments With Forage Plants.

As has been the practice ever since the work with forage plants was undertaken by the Dominion Experimental Farms, the principal varieties of the different kinds of forage plants have been grown during the past year with the object of determining their relative value. During the season of 1913 the tests conducted in duplicate by the Division of Forage Plants at the Central Experimental Farm and the Branch Experimental Farms and Stations throughout Canada consisted of 11 different varieties of mangels, 6 varieties of carrots and 3 varieties of sugar beets. The work with leguminous forage plants and grasses including alfalfa and clover, consisted of breeding for increased hardiness, breeding for high yielding strains of a superior quality and experiments with timothy, orchard grass, western rye grass and some wild grasses. In order to place the more important results of the season's work before the public in a summarized form bulletin No. 76 has been prepared by M O. Malte, Ph.D., Dominion Agrostologist and the Superintendents of the Branch Experimental Farms and Stations. This bulletin of 34 pages is available to all who make application at the Publications Branch, Department of Agriculture, Ottawa.

Cautions for Campers in the Forest.

Forest fires are caused in only too many instances, by campers and tourists who leave their fires unguarded or are in other ways careless about their fires. Many of these holiday makers in the woods would be the last people in the world to wilfully destroy timber in this way, but yet a lack of care on the part of some has often had a most lamentable result.

Occasionally what seem cases of apparently wanton carelessness are met with. A flagrant instance of such neglect was shown some time ago by a party of seventeen campers from Hamilton, Ohio, in the Timagami, Ontario, forest reserve, who broke camp one morning leaving quite a large fire burning. The campers, in their special car, however, were stopped at North Bay, and not allowed to proceed on their journey until they had paid the expense of extinguishing the fire as well as those of their own detention. Such cases are fortunately, rare.

Attention to a few points may save much loss from this cause. No match cigar-end or other burning object should ever be thrown down in the forest until totally extinguished. Camp fires should not be larger than is necessary and should not be left, even for a short time, until one is perfectly sure they are "dead out." Fires should not be built in dangerous places, such as among leaves, near rotten wood or any place where they are likely to spread. Avoid building a fire against a large or a hollow log, for in such a place it is hard to know when the fire has been thoroughly extinguished. In windy weather a hole should be dug down to the mineral soil and the fire confined in this.

DAIRYING.

Some Points About Milking.

While not entering into the subject of wet vs. dry milking, there are some other points to which I should like to call attention.

First, the medium pace milker is the best one in my opinion. My experience goes to prove that the cows thus milked (their points in proportion) hold on their milk longer (lactation period) than those that are milked either faster or slower; they are also good as regards the amount of strippings when being milked. Those cows that are regularly milked by a fast milker invariably have a lot of strippings, and this means that at times, when the milker is in a particular hurry, the cows are not milked "clean" and that is bad for the farmer as also for the cow, becuse cows dry off quickly enough, without aiding them in this way.

Of course, the slow milker does not stand much chance nowadays, but for choice, I would rather have the cows milked by a slow milker, than by a fast one. One drawback with the slow milker is that when someone else has to milk his or her cows, if he or she should hapen to be faster, the cows do not apreciate the milker, and, therefore, do not let down their milk so well. I think, however, that the slow milker will compare very favorably with the fast one if the comparison extends over, say, twelve months. But, as I said at the commencement, the medium-pace milker is the best of the lot, and it is always a pleasure to milk after such.

It is always advisable that the milkers should each milk the same cows every day. In training young heifers to be milked, they should be handled, etc., before they calve, thereby getting them used to it. They should be handled carefully at first, firmly, yet not roughly, and as soon as possible should be milked without being given something to eat during the operation. Giving this may be a good practice to start with, but they should be weaned from it as soon as possible, or else they will always look for it. Better still, if they are milked from the beginning without it, as usually when they are eating their tail is swiching and this is a habit that grows on them, and nothing is worse than to have to milk a cow that is forever swiching her tail. Another thing, they should be taught to stand in the right position from the first, and there will not be any trouble afterwards. I have seen good milkers milking a heifer with the leg nearest the bucket a foot or more in front of the other leg. When the heifer is turned over, as someone else's share to milk she insists in standing the same way, and then the rtouble commences, as everybody canot milk with the wrong leg in front, and, besides, it is not right that they shonld.

Lastly, regularity in milking is a great thing; that is to say, as near as possible to the twelve hours for both meals, and this is where buttermakers have the advantage over milk-sellers in my opinion. I see milk-sellers' cows being milked from three to four in the afternoon, and especially during the winter months, as some of them send only their morning's milk to town, and then they cream the afternoon's or evening's milk.

Testing Milk on the Farm.

One of the greatest money savers ever offered to the dairyman is the Babcock tester and the principles which govern its use are very simple. The essentials needed are a centrifugal machine revolving at a high speed whereby the botles containing the milk can be whirled, nad a few simple pieces of glassware. There are several makers of machines, all having their good points. In the long run, the best machine will be the simplest and the same may be said of the glassware. Test bottles are needed for both new and skim milk and for cream, and it will be well to have three of each of these kinds on hand.

Correct results will depend upon having a good sample. In order to get a sample of any kind of milk or cream suitable precautions must be taken, as the fat globules rise rapidly to the top, and unless care is used the sample will not be fairly representative. A good sample of milk can only be obtained by mixing it thoroughly by pouring it from one vessel to another at least three tmes, and five or six would be better. As soon as possible after thorough mixing, the sample should be tak en out by dipping with a small, long-handled dipper of any kind. If the sample is to be carried any distance, the vesel in which it is to be carried should be filled absolutely full, for otherwise some butterfat wil be churned and an acurate test canot be made.

The testing should be done while the milk is sweet. When the milk is thoroughly mixed, insert the lower end of the pipette into the vessel and, with the mouth applied to the uper end, by suction draw up the milk until it is a bit above the mark indicating the correct amount (17.5 c. c.). Then place the dry finger over the top of the pipette and by raising it very slightly let the milk fall to the mark. Allow the milk to run slowly from the pipette into the test bottle, and when all is out that will run, gently blow out the pipette as dry as possibe. In testing heavy cream, weigh rather than measure, if exact results are desired.

Sulphuric acid with a specific gravity of 1.82 is used in making the Babcock test. The acid may be purchased from any dairy company. After the milk has been placed in the test bottles the correct amount of acid (17.5 c. c.) should be carefully measured out into the vesels marked for that purpose and poured into each botle. Great care must be used in doing this or the results will be unsatisfactory. The acid should be poured down the sides of the bottle so as not to entirely close the neck or char the milk. Mix th acid with the milk by shaking with a rotary motion. This mixing should be very thorough. If the acid has been properly added, the mixture of milk and acid becomes perfectly translucent.

If a number of tests are to be made at the same time, which is usually the case, it should be remembered that it is best to mix the acid and milk in each bottle as soon as the acid is added. The proper temperature of the acid and milk is about 60 degrees. If the acid is too strong, a black curd is the result. Black curd is also formed if the milk is too warm. On the other hand, if the acid is too weak, the casein is imperfectly dissolved and white curd appears in the mixture. The bottles are now placed in the tester in such a manner as to balance. Run the machine according to the directions given. The whirling must be continued for five minutes. As soon as the machine stops, take out the bottes and add enough hot water to bring the fluid in the bottles nearly to the top of the graduated part of the neck. Then put the botles in the machine again and whirl for five minutes. When the machine stops examine, and if the division between the fat and the fluid beneath is not clear, whirl again for a minute or so.

Where several tests are to be read, the botles should be placed in a pan of hot water to keep the fat in a melted condition, for if it does not "run" readily, serious errors will result. The test must be read from the extreme bottom of the fat to the extreme top of the fat column. The difference between the lower and upper reading gives the percentage of fat. For reading, a small pair of accurate compasses will prove most useful. Place one point at the extreme bottom of the fat column, the other at the extreme top of the fat column. Leaving the compasses just as they are, move them down the sceale nutil the lower point rests on

"Melotte" CREAM SEPARATORS

The "Melotte" will increase your butter yield 25% besides improving the quality.

Saves time and labour, space and utensils.

Owing to its Suspended Bowl the "Melotte" is the simplest, most easy running and consequently the most durable cream separator made.

the lower line in the scale The other point will then stand at the line which indicates the percentage of fat. All the [illegible]re must be kept perfectly clean This will be little trouble if the bottles, etc., are washed immediately after using

A single milking will not give an accurate idea as to the quality of milk given by a cow. The mixed milk for a number of successive milking will be far better. Such tests are known as composite tests. In order to make a composite test for the cows of a herd, a separate jar must be provided for each cow. At each milking pour the milk back and forth as directed. Then take a small sample and put it into the jar. To prevent souring, use a preservative. Bichrmoate of potash answers the purpose. A quantity sufficient to preserve half a pint of milk for a week can be taken up in a 22-caliber shell cut one-half inch long. A sample from each milking for three or four days will be approximately accurate, and the amount taken out at each time should be gauged so that the total amount will be about half a pint. With the use of the Babcock tester and the daily milk record it will be an easy matter to weed out the unprofitable cows and keep up a higher standard with the remainder of the herd.

SUSSEX, N. B.

Protect the Cows from Bloat.

With the coming of spring when the catte are changed from dry feed to pasture, to avoid serious loss it is necessary for the farmer to watch carefully for bloat, according to the veterinary department of the College of Agriculture of the University of Wisconsin

Bloat is a form of indigestion due to the excessive formation and accumulation of various gases in the paunch or rumen. The attack is especially apt to occur when cattle are suddenly changed from a dry diet to green clover or alfalfa. It is most often seen during warm, wet weather, or when heavy due or rain moistens the foliage.

The chief symptom of bloating is a sudden distension in the left flank, which swells up and appears as tight, as a drumhead when thumped with the finger. Relief must be immediate, if suffocation is to be avoided, and consists in providing an artificial outlet for the gas by "tapping" the animal. This is best accomplished by inserting a trocar and canula into the most prominent portion of the swelling. To prevent further gas formation administer a drench of two ounces of turpentine in a pint of raw linseed oil or a quart of new milk.

As a prevention, aviod turning the cattle out until the dew or rain has dried off. In addition, giving a full feed of dry roughage, such as the animals are accustomed to, just before turning them out, will be found helpful in preventing this trouble.

Supplementing Dry Pastures.

In response to many inquiries, Prof. O. B. Nystrom, Dairyman at the Washington State College, has prepared the following statement: Each summer a number of pastures dry up, or at least begin to fail In order to keep up the milk flow something to help the pastures along not only shows in the milk pail but lengthens the life of the pasture.

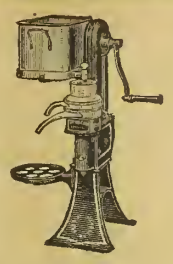
Crops that may be used for thispurpose are thousand-headed kale, peas and oats, vetch and oats, peas and barley, alfalfa, corn and clovers. Those may be used either as soiling crops or as silage. Any of the root crops may also be used to advantage, if they are large enough for this purpose so early in the season.

The thoughtful dairyman prepares for this shortage of pasture by sowing these soiling crops each spring, at intervals of from three to four weeks, and has them ready for the cows when needed. But if these special soiling crops are not sown, any green food that will be relished by the animals is valuable to keep their digestion in good shape and stimulate the milk flow.

The summer silo is probably the best solution of this problem of summer feed, for it enables the dairyman to harvest his crop at the proper time and then feed it out when needed in just as good a condition as when put into the sio.

Concerning fodder corn for soiling, Professor Henry says: "On farms lacking summer silage, feeding corn forage in the green stage would become general, for the reason that during the late summer and early fall the pastures are often scant and animals forced to subsist on them suffer from lack of sufficient food and can not do their best An acre of ripened corn fed in early fall to dairy cows which are otherwise on poor food, may so advance their condition as to return double the value it would yield were it held over until winter and fed at a time when there is often a plethora of the same material."

The testing association promotes a better appreciation of the cow and consequently better results are sure to follow.



Write for the new catalog and learn full particulars about this superior machine, which skims on the average down to .01 per cent. The Standard cream separator is a big money earner. Every man who owns two or more cows should own one.

FIRM BUTTER

Butter made from cream skimmed by the Standard cream separator is noted for its firmness. This is due to the fact tbat the curved wings of the Standard's centre piece prevent the breaking of the globules of butter fat during the process of separation. Just why the curved wings of the

Standard

do this is explained at length in our new separator catalog which also gives other interesting information. Every dairyman knows that good solid butter brings the highest price—and that's the kind of butter the Standard insures.

LIVE STOCK.

The Castration of Farm Animals.

Farmers do not think it worth while to discuss the question whether castration is a cruel operation or not. They are forced to take things as they are, and recognize that as long as domesticated animals are kept for the food of man the operation is absolutely necessary, and whether they like it or not they have no alternative. The production of wethers and oxen is a part of practice which is universal where stock-keeping is made a business, but it is worthy of note that the farmers of Northern France do not as a rule castrate their foals, and experience no difficulty from working the entire animals on the road. But while castration on the farm seems to be indispensable, there is no doubt that the very familiarity of the operation entails the danger of forgetting that the pain inflicted is very real, while to the low value of the animals dealt with, particularly of the sheep, is to be attributed the fact that the methods employed are often very slipshod, that the persons employed are often very ignorant, and that the after consequences are attended with more pain to the animals than there is any need for. Untoward results may, of course, attend every surgical operation, more particularly if it is conducted in a farm yard or other place where the cleanly surroundings of the human operating theatre are not obtainable; but a good deal of the mischief is due rather to active errors than to neglect, and might be easily avoided.

Sheep and Lambs

Early methods of castration are often very crude indeed, and of the most barbarous character, but it is not necessary to detail these because they have fortunately fallen into disuse. But even under present methods, though the operators are often really skilful at their work, the death rate is sometimes exceedingly high; blood poisoning may set in, and when this occurs among a large flock of sheep, the losses may run into a very high figure. It is just as well, therefore, to remember that when young lambs are to be sold quickly for the butcher no object is to be served by the operation, and they may as well be left alone to enjoy their existence until they are "fit to kill for food." What happens very often in the case of a flock is that a day is appointed for the business, and, in order to get it over, al the lambs, whatever their age, are dealt with at the same time. This is a mistake, particularly when the day chosen does not happen to be specially favorable; but whatever the weather, there will probably be many in the flock who are not old enough or strong enough to undergo it. A far better plan is for the shep herd to take each animal as he notices. that is big enough and strong enough and treat it separately. Perform the operation, whenever possible, in the early morning, so that the animal may have the whole day before in which to recover from the shock. In the spring when the work is generally done, the nights are sometimes very cold, and a low temperature is unfavorable

The method usually adopted with sheep is to cut off a piece of the lower part of the scrotum, press out the glands and draw them. A pair of forceps should be used for this purpose, but the attachments should be separated first, as this makes the drawing easier, and probably less painful. We regard as most insanitary, the unpleasant method of drawing the glands forcibly away with the teeth; the human mouth is not aseptic—it is probably, even in the case of a comparatively cleanly individual, in a condition which a surgeon would desscribe as foul—but the operator may be anything but cleanly, and it is easy to understand that such a method as this may lead to blood poisoning and loss. All hustling of the flock should be avoided before the work of castrtation is entered upon. If the animals are heated, or if the sun is hot, the danger of complications is greatly increased, so that for his own sake the farmer should avoid exciting the animals. Bleeding should be prevented as much as possible—this is a point of great importance in the case of sheep and when anything of the kind happens the animal should be kept apart and carefully watched, all clots being removed when the bleeding is stopped. If the clots remain and bleeding should still be in progress, the blood retained may undergo decomposition—with bad results. This is one reason why removing a piece of the scrotum, which may seem unnecessary, is really less cruel than making a slight cut; the blood has a better chance of getting away, and whatever discharges there are will have a free vent. When big males and old rams are castrated the hot iron is employed because of the risk of the formation of clots.

Use of Irritants.

Perhaps the greatest fault committed by the castrator on the farm is in the use of irritants, which are applied to the cut end of the cord. A common form of this is the "green" ointment, which is made of verdigris, and the effects of its use are very painful for a considerable period. It is quite unnecessary, a needless infliction of pain, and no surgeon would think of using such a dressing. The green ointment is used for the purpose of inducing suppuration, and our own statement that it is not called for may be supplemented by the opinion of an eminent veterinary surgeon. Professor Williams says that "this is a very reprehensible practice, calculated to inflict much unnecessary pain. There is no necessity for the establishment of any suppurative action—indeed the very fact of there being any suppuration at all indicates that an amount of inflammation calculated to retard the healing process has been caused by the operation, and instead of irritating the parts by abominable mixtures it is the duty of the practioner to perform the operation in such a manner as to cause but the slightest possible degree of pain, and to do nothing having a tendency to retard the process of repair by the adhesive inflammation."

For Baking Success —This Oven Test

Success on some baking days can be expected no matter what flour you use. But constant success is rarer. It can be assured in only one way. The miller must select his wheat by oven test.
So from each shipment of wheat we take ten pounds as a sample. We grind this into flour. Bread is baked from the flour.
If this bread is high in quality, large in quantity, we use the shipment from which it came. Otherwise we sell it.
Constant baking success comes as a matter of course from flour bearing this name

erator are also clean; in this way a good deal of the danger will be averted.

Pigs.

The castration of pigs is often carried on in a very haphazard fashion, but in reality these animals call for special care, owing to the large number of cases in which scrotal hernia occurs. This is a complication to be looked for in all animals, but it is especially common among young pigs The trouble may be detected before the operation is performed, and in that case it is best to push the youngsters on as fast as possible for the butcher without operating. But if it is decided to operate, care must be taken, and any injury inflicted attended to at once.

Bullocks and Calves.

For the calf or young bullock two men must be employed, and a noosed cord is used to secure the animal. The testes are removed through two separate incisions, but these should be slit into one after the removal, and care should be taken that this is at the lowest part of the scrotum, for here again provision for free drainage is essential.

The age at which animals are operated on must depend very argely on circumstances. The best time for lambs is probably on the first favorable opportunity after they reach the age of a fortnight, but it is often delayed until they are much older. Calves are usually treated somewhere about the age of three months. Colts are usually left until they are approaching twelve months. It is believed that the later the period the more masculine and fully developed the animal becomes, and as this is a point of some importance in the horse, owners sometimes delay the operation much longer. It must be remembered, however, that the older the animal the greater the risk and further the greater loss, if loss occurs, inasmuch as he has cost more to rear.

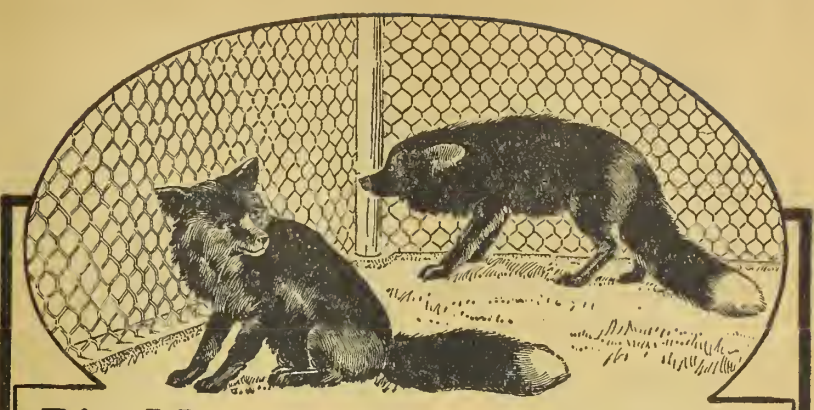
As questions on such matters often appear in live stock papers, it may be added that the plan often followed of using, with various animals, a clamp which is fixed on to the cord and left there for a considerable time, is a cruel one, causing a good deal of pain, which need not be inflicted

Anaesthetics.

There is one matter which claims the consideraton of every humane owner of stock—how far in the case of painful operations suffering may be prevented by the use of anaesthetics. We are quite aware of the objections that may be offered—considerations of cost, extra trouble and so on, but in the case of the larger and more valuable animals like horses and cows, and more particularly when they are aged or fully developed, the expenditure will often be found to be fully justified, apart from the question of humaneness. Professor Hobday, one of our most experienced veterinary surgeons, states that the horse is a good subject for chloroform, and he has used it freely, while the evidence showing that it s perfectly safe for many other animals is strong enough to warrant its employment. A large proportion of those who may be termed the modern veterinary surgeons continually use aanaesthetics, and Professor Hobday himself has kept records of 1,200 consecutive cases in which he has used chlorform on dogs. In all these death occurred in only five, notwithstanding the fact that the animals were taken as they came, and there was no opportunity in preparing them in the way that would naturally be adopted in the case of a patient in a hospital.

In the face of these facts, allegations that the use of anaesthetics is not safe canot be regarded as having any foundation, though the impression that they are not so in the case of animals is very common Professor Hobday, who always uses cocaine in cases of castration, adds that a good many farmers are adept in the use of anaesthetics and use them for operations which they carry out themselves, but by far the majority of castrators other than veterinary surgeons make no use of them at all. Obviously the gain from their use is not confined to the avoidance of pain, for if an animal is rendered insensible the operation is far more likely to be efficiently performed.—F. and H., England.

Editor's Note:—In the case of lambs buyers in the aritime Provinces will give one cent per pound more for castrated lambs than they will for ram lambs. It therefore pays the farmer to castrate his ram lambs early.



Big Money Inside The Fence

Yes! There's big money behind the wire netting of a Black Fox Farm. That's why so many owners of ranches for fur-bearing animals buy MARITIME NETTING. They want to feel positive security about the valuable animals inside the fence.

MARITIME Wire Netting is galvanized after weaving—no little places missed or unprotected crevices that will corrode and form a weak spot later on. Fur ranchers can't afford to take any such chances—therefore they buy MARITIME NETTING.

Always a good stock on hand ready for shipment and every foot of it **guaranteed.** Buy MARITIME NETTING for your poultry farm—there's none better at any price, none more strongly guaranteed. 14

THE HORSE.

Balking Horses.

The vice of balking is not a specially common one but stands out plainly as the most annoying weaknes possible for horse flesh to display. Reams may be writen as to what to do and all the remedies may fail. Proper consideration would look at once to the cause, especially in young horses, and if this be done it will be found that in ninety-nine per cent. of the cases, the origin of the trouble is in putting on too much load. Colt-breakers should never be in a hurry to complete any job nor should be rushed at the first work that comes along, no matter how busy the season or short the help.

Naturally the draft bred colt needs the least breaking and possibly on that account less care need be taken with him. In the case of horses of trotting more or less "high strung" lineage being broken to pull the driver must be forever on the lookout. It is a very easy matter to make such a horse balky. One of the easiest ways to do this is to hitch him with some other horse that is much slower. The younger one being the faster and ambitious is continually surging ahead and as continually being taken back. Unless the driver has unlimited patience—a characteristic rarely seen in any but the owner—he will after a time long or short do some yanking at the youngster and then trouble looms like the headlight of a locomotive approaching at the rate of 60 miles an hour.

As to the matter of curing a balking horse once the habit has become fixed many men tell many stories. The most ridiculous, cruel and inhuman acts have been credited with success, but once a balker always a balker comes very nearly fitting the case. However, as there is no infallable rule and as patience that never gives out coupled with good management alone may be said to hold forth any hope of ultimate and permanent success, the writer would advise the owner of the colt which shows signs of becoming balky to abstain from using him in any wheeled vehicle for some time. Instead hatch him to a light sled, giving him enough advantage on the doubletree so he will be able to do his share of the work easily and comfortably. Then if he does well—and the probability is that he will—the transition to the wagon may be gradual. The writer can only offer such measures remedial as he has successfully tested and seen tested. He once cured a mare of balking by using her this way in the middle of the trey for a whole year and eventually hitched her to the wagon in the trey, then to the bobs drawing hay on the snow and when spring came and the near horse was taken off she went all right. It was a mean job but it paid.

Another point to be considered is condition. Many a colt has balked simply because he was poor and run down, without ambition and generally in better shape for the knacker's yard than the breaking harness. Always see to it that young horses are in good flesh and spirit when the breaking process is begun.

Again, the ridiculous idea of "hitching a colt up and driving him right off like an old horse" is all buncumbe. The man who knows no more than to bridle a horse and try such capers ought to get into trouble. Some have succeeded but they are the exceptions and when these instances are looked up it is generally found that the real breaking has been done consciously or unconsciously in some other way. A colt's mouth is a very tender thing. It should be thoroughly toughened before any driving is attempted. It is the same with the harness. The colt should be perfectly accustomed to it and a close watch should be kept to see that the collar and straps all fit "neither too free nor too bind."

Rheumatism in the Horse.

There is a good deal of discusion at the present time about this disease in the horse, and by many both navicular disease and ringbones are supposed to be due to a form of rheumatism, and undoubtedly the same treatment is of service, especially in navicular disease. Rheumatism may be defined as an inflammatory affection of the joints fibrous, muscular, or nervous tissues, having a tendency to migrate or spread when affecting the muscles of the lumbar region. In the human subject, it is spoken of as "lumbago," or, if the great sciatic nerve or the muscles of the neck or shoulder (stiff neck) be affected as sciatica.

At present the essential cause is not known; there are three hypotheses, two modern, one ancient. I will take the later first. For many centuries the humoral pathology dominated the practice of physicians. The speculation was that all diseases, bodily and mental, depeded on the conditions and proportions of the humours, of which there were four: blood, phlegm, yelow bile and black bile. Here we have the origin of the modern word rheumatism from "rheuma," a flowing, as it was supposed by the old physicians to proceed form a defluction of humours. The more modern theory is that is is due to a specific bacillus, but up to the present it has not been satisfactorly demonstrated. The third, and one that accords more with the facts, is that it is due to perverted granular functions which produce auto-toxins, which, passing into the blood stream, produce the great varieety of forms which this disease assumes. Predisposing causes are heriditary tendencies, exposure to cold and wet, sudden chills, and changes of temperature.

A rigidity in the affected joints, which often, when moved, give out a cracking sound, pain at the commencement of movement, and swelling of the joints due to effusion in the articulation. The animal becomes very lame on one or more limbs, but the peculiarity of the lameness is its tendency to shift. It may be acute or chronic, and the first form undoubtedly does occur in our animals, but is not very comon. The pulse and temperature are high, the skin is hide-bound, there is a staring coat, and difficulty in rising due to the lumbar facia being involved. All these may pass off in a few days and leave no ill effects behind, but there is a tendency to recurrence.

The chronic form affecting the joints—rheumatoid arthritis—may be sight at first, and with care and treatment the ameness may pass off. And here comes a pitfall in the purchase of a horse. Plenty of horses change hands at our public markets that are the victims of these recurring attacks from a constitutional diathesis, and eventually become unworkable. In this form it is caled "joint felon."

The changes that take place are as follows:—First in the articular cartilage. This by degeneration as the joint moves wares away until the bones rub against each other, and become shiny and ivory like in appearance. Next, the synovial membrane, by becoming very vascular, secretes more synovia, and hence the swelling. At the same time, suppuration rarely occurs. Lastly, at the margin of the cartilage a form of bony matter, or calcification, goes on, but true bony anchlyosis is rare. Now here comes a question: Are spavins, splints, sidebones, ringbone, and navicular diseases only different manifestations of this protean disorder, modified by the difference of food, drink, and habits;

The cause possibly may be due to rheumatism; at any rate the fact remains that similar treatment and drugs that have so beneficial an effect in the human subject in this disease, have also corespondingly a good effect in retarding or ameliorating the symptoms.

Rest is a mistake. Slow work, a dry stable, an occasional purgative, careful feeding, and ripe crushed oats are good. Clover hay and peas or beans ought not to be given. If sudden lameness and heat come on apply fomentations and friction with soothing liniments, and afterwards a blister applied only for two hours. Aceto-salicylic acid in doses of two drachms at night and iodide of potassium in the morning in doses of from thirty to forty grains, occasionally discontinuing same for a day or two, have given the best palliative results; also give four or six oun-

Sound as a Dollar

That's the only way you can afford to keep them, because any lameness means less work and less profit to you.

Spavin, Splint, Curb, Sweeney, Ringbone, Swelling or Lameness need not prevent your horses from working. Simply use Kendall's Spavin Cure.

It works while the horse works—takes away the pain—reduces swellings—makes legs and joints sound and strong—leaves no scars or white hairs because it does not blister.

Kendall's Spavin Cure

has been the horseman's standby for 40 years and is used all over the world.

Burns, Ont. Sept. 10th 1909.
"I have used Kendall's Spavin Cure and it cures Old Stubborn Cases."
WILLIAM H. DOUD.

Keep your horses sound as a dollar. Get Kendall's today and you will have it tomorrow if needed. $1 a bottle—6 for $5.

Minard's Liniment Co., Limited.

I was very sick with Quinsy and thought I would strangle. I used MINARD'S LINIMENT and it cured me at once.

I am never without it now.

Yours gratefully,
MRS. C. D. PRINCE.

Nauwigewauk, Oct. 21st.

There never was a time when people appreciated the real merits of Chamlain's Cough Remedy more than now. This is shown by the increase in sales and voluntary testimonials from persons who have been cured by it. If you or your children are troubled with a cough or a cold give it a trial and become acquainted with its good qualities. For sale by all dealers.

ces of Epsom or glauber salts in a bran mash sweetened with treakle once or twice a week as a stimulant to induce greater functional activity in the liver or kidneys.—Southern Vet.

Attention to Horses Teeth.

There are many horses of all ages that are not thriving well, although consuming a reasonable amount of food, and their owners are at a loss to account for it, and often spend money in condition powders, stock food, etc., without result. The animals do not show symptoms of illness, but simply do not thrive, and have not the spirit of energy they should have. The cause in the majority of cases will be found in the mouth, either there is faulty dentition or there are irregularities of the teeth. The subjects do not require medical treatment all that is needed is intelligent attention to the teeth. We say "intelligent attention" as in many cases unskilled or ignorant interference does much more harm than good. It requires a man who thoroughly understands the anatomy of the mouth, and has the necessary instruments and skill to correct whatever is wrong.

Breeding Matched Teams.

As one rides over the country he sees an occasional band of farm horses as much alike as peas in a pod. As they stand at attention while a train approaches, they present a uniform lot of heads and a similar degree of interest. Perhaps they wheel and race away across fields, exhibiting a striking similarity in form and movement. They are either bred alke or selected by a master horseman.

It is possible for an experienced horseman to pick up animals here and there and yet have them match up nicely in conformation, quality and action. But one is sometimes deceived as to dispositions. Sometimes the horse with an excitable temper fags out and lags behind at the end of a hard day's work, while a quieter horse keeps more strength and vitality in reserve. It is not always the fast horse in the morning that is ahead in the afternoon. The man who breeds his own work horses may not be as keen a judge yet if he gets the right start he has a great advantage in the effort to produce a uniform lot. There will be many small variations in his productions, but if he mates his mare with a stallion like her in appearance, disposition and breeding, the offspring will average very similar. Many desirable lots of farm horses are the descendants of one or two good mares, whose daughters and granddaughters, like them, have ben mated in the same way.

It is a pleasure to work such horses. They look well together and they step along with the same vim and persistence. A uniform lot of farm horses is an indication that the owner knows what he is doing and has definite plans for accomplishment.

Too much water, especially very cold water, given to an over-heated animal coming in from work, may produce colic or other digestive derangements. By all means, however, give the warm, tired horse a few swallows when coming in which will aid in cooling him off, moisten his parched mouth and throat and induce him to eat dry feed more readily.

When beginning the horse on the land, rest them at short intervals and lift the collars from off their shoulders down well with the hand. This removes sweat and dirt and goes a long way towards pre venting ugly sores.

Keep the stable well ventilated during the spring season, but avoid direct drafts on the working animals. Colds often result from the raw night winds blowing directly on the sweaty coats of the tired animals.

NEPONSET Paroid Roofing

There's a NEPONSET Roofing for Every Building

GET Neponset Roofings—the "slowly made" kind. Then you are sure to get roofings that are slow to wear out. Then you'll never get a poor roofing when you need a good one.

Neponset Roofings are long on the roof—because long "in the making." This means more than you think. It means this: Maximum protection to your home—your stock—and your pocket-book. Protection against leaks—repairs—and that greatest danger of all—fire. Remarkable "year-in-and-year-out" protection—in cold or hot climates—at a minimum cost—this is the "blanket protection" slowly made Neponset Roofings *invariably* give.

There's a slowly made Neponset Roofing for every purpose. Neponset Paroid is the great roofing for fine farm buildings.

Other Neponset Roofings are—Neponset Shingles for residences; Neponset Proslate, the colored roofing.

Sold by dealers everywhere. Write for name of nearest dealer.

POULTRY.

Variety in Feeding Fowls.

In order to make utility poultry-keeeping a success plenty of variety must be introduced into the feeding of the birds. Even poor quality fowls of barndoor stamp can be induced to lay quite a lot of winter eggs if the feeding is right. There are many good foods on the market, not too expensive, but still not used half as much as they might be.

The Value of Meat

In order to obtain a big supply of winter eggs plenty of cooked meat is essential, but it is also necessary that the meat should be purchased at a fair price. "Lights" are very good, but they require a great deal of boiling, and they involve an amount of trouble which most fanciers do not desire, while they are also somewhat disagreeable to handle, and unless they are cut up into small pieces they cannot be served out properly.

Green Cut Bone

Fresh green cut bone is a valuable winter food for helping the egg supply, but if it is not served absolutely fresh and ground from bones which are full of nutriment it will be of no value, for stale bones set up bowel trouble and other minor diseases The dry bone meal which is now largely advertised, although it is useful for growing fowls, act in the same way as the fresh cut bone.

Corn Feeding

A large number of fanciers still firmly believe that plenty of corn, both in the form of meal and grain, is one of the best methods of feeding fowls in winter. I admit that it is a cheap way, but cheap feeding never did bring in maximum profits. It is only by using the very best of foods carefully blended, that the winter egg supply can be brought to satisfactory dimensions.

A little corn on cold mornings, especially if it is very frosty, is undoubtedly useful, since it helps to promote bodily heat, and in this way keeps the birds in sound condition; but if it is given in large quantities it has a tendency to induce liver trouble—to make the birds put on superflous flesh. Yet corn is a food that is tolerated in fifty per cent. of present-day poultry yards, and it is still highly spoken of by many who use it.

Experts are doing everything in their power to induce poultry keepers to give less corn, and although their efforts to a certain extent are successful, there is no doubt that corn appears far too frequently in the daily menu. Barley-meal, which is also largely employed, is really too fattening. Like corn, it can be served in very cold weather, but at other periods should be used sparingly.

Fig 2--House with Cotton Windows hooked up to allow Sunshine and Fresh Air in on the Floors and the Birds.

(See page 551)

Green Food

It does not matter how much cooked meat is given or how well the various grains are selected, unless there is a fair proportion of green food introduced winter eggs will not be forthcoming in proper numbers. To some people the supply of green food presents one of the greatest difficulties at this time of the year. Cut clover which has been scalded over night is undoubtedly good; boiled cabbage leaves, and anything so long as it is succulent, are bound to prove useful; but high prices cannot be paid for this kind of stuff. Still, all those who live near our large towns ought to be able to purchase green food at a very low figure. Turnips, too, can be boiled, or even given in the raw state, if the supply of green food seems to dwindle during certain weeks.

Method Important

Even if one has at one's command all kinds of poultry foods, is able to give plenty of variety, and to feed on nothing but the best lines, it does not follow that egg production will be carried out successfully. There must be a method in feeding, and unless the method is correct, unless the system is properly carried out, the birds will not benefit as they should.

Some people advocate giving grain twice, with a hot soft mash in the evening. I believe this has given excellent results to those who are keeping fowls in the sem-intensive system. Another class of poultry-keeper has adhered to the plan of giving a hot morning mash, say, at eight o'clock, with a

SISTER: READ MY FREE OFFER.

I am a woman.
I know a woman's trials.
I know her need of sympathy and help.

If you, my sister, are unhappy because of ill-health, and feel unfit for household duties, social pleasures, or daily employment, write and tell me just how you suffer, and ask for my **free** ten days' trial of a **home treatment** suited to your needs; with references to Canadian ladies who gladly tell how they have regained health, strength, and happiness by its use. I want to tell you all about this successful method of home treatment for yourself, my reader, for your daughter, your sister, or your mother. I want to tell you how to cure yourselves at home at trifling cost, and without aid from anyone. Men **cannot** understand women's sufferings; what we women know **from experience**, we know better than any doctor; and thousands have proved there is **hope** even **for the hopeless** in my method of home treatment. If you suffer from **pain in the head, back**, or **bowels, feeling of weight** and **dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating or unnatural enlargements, catarrhal conditions, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you** to send to-day for my complete **ten days' treatment** entirely **free and postpaid**, to prove to yourself that these ailments can be easily and surely conquered at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and **when you are cured**, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—**young or old.** To **Mothers of Daughters**, I will explain a simple home treatment which speedily and effectually cures green-sickness (chlorosis), irregularities, headaches, and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember **it costs you nothing** to give my method of home treatment a complete ten day's trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. **Is health worth asking for?** Then accept my generous offer, **write for the free treatment** suited to your needs, and I will send it in plain wrapper by return mail. To save time you can cut out this offer, mark the places that tell your feelings, and return to me. **Write and ask** for the **free treatment to-day**, as you may not see this offer again. Address:

Progressive Farmers Make Handsome Profits from Poultry

THE stoutest advocates of Poultry-Raising on the farm are the progressive farmers who have investigated the Peerless Way. These men are alive to the fact that Canada does not produce one third of the poultry and eggs consumed in this country, and that handsome profits go across the border to the American farmer who is called upon to supply the shortage.

You, Mr. Farmer, can have this profit, plus the amount spent in Customs duties and long freight hauls importing eggs and poultry from the States, and you will always have an eager market waiting to buy up all the poultry and eggs you can raise.

Read what this British Columbia farmer says:

Greenwood, B.C., Dec. 1, 1913.
"I am pleased to report a good season for the past summer with the poultry . . pullets are just commencing to lay. Eggs hatched well and I raised practically all in the Brooder and only lost (1) chick out of 500 hatched. I sold 20 dozen baby chicks and am keeping over 150 pullets, as it is the egg trade that I am working up.
"Since last September, eggs have been selling here at 70c. per doz., and at present they are bringing 80c. and are very scarce too."
(Sgd.) A. R. Royce.

The Peerless Way Makes Poultry Pay

The whole idea of the Peerless Way of Poultry Raising is to raise the greatest number of the strongest chickens at the least outlay of money and with the least expenditure of time. We know that a farmer's regular duties do not leave him much time to look after chickens, so we have bent all our energies to perfecting a system whereby a farmer can take care of 400 or 500 chickens the Peerless Way in less time than he can look after 30 or 40 the old way.

little green food or a little wheat at noon, and a heavy meal at night. So long as the birds are never overfed for the first two meals, but given as much as they can eat at night, they will do well; but if the system is reversed, if food is given in big quantities in the morning and the birds allowed to roost with insufficient food in their crops, this is not the right way of promoting winter egg production.

Given good food, satisfactory housing, and scrupulous cleanliness, egg production during the winter months is not an impossible proposition. On the contrary, hundreds of fanciers are now obtaining good results; but there are certainly far more who have not yet solved the problem, and it is to this class I appeal, if their methods of housing and feeding are wrong, to make a radical change, and try to feed their birds on the lines suggested above.

Feeding Young Chicks.

Do Not Feed Too Soon

When the chick is hatched it ed it hasit has a sufficient supply of nourishment in the yolk of the egg to last for several days. What the chick requires for the first few days is not feed but warmth and rest.

A Little Sand or Grist First

When the chicks are removed to their brooding quarters there should be some coarse sand or fine grit scattered where they can have free access to it. They should then be left until they show positive signs of hunger, which would be between the second and third day after hatching. They may then be given some bread crumbs that have been very slightly moistened with milk; this may be scattered on clean sand or chick grit. If being brooded by a hen she will see that no food is allowed to lie around, but if in a brooder that part of the food that the chicks do not pick up in a few minutes should be removed as nothing in feeding causes so much trouble as leaving food of that nature around until it is sour.

Feed For the First Ten or Twelve Days.

The following daily ration of five feeds given about two and a half hours apart and continued from the time the chicks are two to three days out of the shell until 10 or 12 days of age may be altered or adopted to suit conditions;

First feed:—Dry bread crumbs slightly moistened with milk.

Second feed:—Finely cracked mixed grains or commercial chick feed.

Third feed:—Rolled oats.

Fourth feed:—Dry bread crumbs moistened with milk.

Fifth feed:—Finely cracked mixed grains.

In addition to the above give the chicks daily a little green food such as grass, lettuce, sprouted oats, etc. Do not have the moistened bread sloppy but in a crumbly state and during this period let the chicks into fresh soil or rass every day if possible.

Feed After Ten or Twelve Days.

After the chicks are ten days to two weeks old, coarser foods may be allowed. The infertile eggs may be boiled and mixed with the mash food and the bread and milk discontinued. Hoppers in which is put cracked grains and dry mash or rolled oats may be placed where the chicks can have free access to them. As soon as they become accustomed to the hoppers all hand feeding except the mash may be discontinued. If the chicks are on range it will be found that after a time they will get careless about coming when called at which time the mash may be dropped and dependence placed entirely upon the hopper feeding.

Place grit and water, also a dish of sour milk if possible where the chicks will have free access to them. Nothing provides animal food in better form than does milk, the chicks like it and thrive on it.

A DAIRY farmer who does not use a cream separator is losing up to $15 per cow per year. Complete your dairy equipment by the purchase of an International Harvester cream separator—Lily, Bluebell or Dairymaid. These separators skim closely—leaving barely a drop of cream in a gallon of milk—and they will do it for years.

These machines are furnished with pulleys for the use of power. Belted to a small I H C engine, you have the best outfit it is possible for you to buy. Note the low supply can on I H C separators, the height of the milk spout which allows a 10-gallon can to be used for the skim milk, the strong frame with open base which can be kept perfectly clean, and the dozen other features which make these I H C machines the best.

Your local dealer should have one of these machines on sale. If he has not, write us before you buy and we will tell you where you can see one; also send you an interesting book on separators.

David Copperfield.

By Charles Dickens.

(Continued from last issue.)

"And you will be right," said Mrs. Steerfort. "My son's tutor is a conscientious gentleman; and if I had not implicit reliance on my son, I should have reliance on him."

"Should you?" said Miss Dartle. "Dear me! Conscientious, is he? Really conscientious, now?"

"Yes, I am convinced of it," said Mrs. Steerforth.

"How very nice!" exclaimed Miss Dartle. "What a comfort! Really conscientious? Then he's not—but of course ne couldn't be, if he's really conscientious. Well, I shall be quite happy in my opinion of him, from this time. You can't think how it elevates him in my opinion, to know for certain that he's really conscientious!"

Her own views of every question, and her correction of everything that was said to which she was opposed, Miss Dartle insinuated in the same way; sometimes I could not conceal from myself, with great power, thou' in contradiction even of Steerforth. An instance happened before dinner was done. Mrs. Steerforth speaking to me about my intention of going down into Suffolk, I said at hazard how glad I should be, if Steerforth would only go there with me; and explaining to him that I was going to see my old nurse, and Mr. Peggotty's family, I reminded him of the boatman whom he had seen at school.

"Oh! That bluff fellow!" said Steerforth. "He had a son with him, had he not?"

"No. That was his nephew," I replied; "whom he adopted, though, as a son. He has a very pretty little niece, too, whom he adopted as a daughter. In short, his house (or rather his boat, for he lives in one, on dry land) is full of people who are objects of his generosity and his kindness. You would be delighted to see that household."

"Should I?" said Steerforth. "Well I think I should. I must see what can be hone. It would be worth a journey (not to mention the pleasure of a journey with you, Daisy), to see that sort of people together, and to make one I am."

My heart leaped with a new hope of pleasure. But it was in reference to the tone in which he had spoken of "that sort of people," that Miss Dartle, whose sparving eyes had been waiting for us, now broke in again.

"Oh, but really? Do tell me. Are they, though?" she said.

"Are they what? And are who what?" said Steerforth.

"That sort of people. Are they really animals and clods, and beings of another order? I want to know so much."

"Why, there's a pretty wide separation between them and us," said Steerforth, with indifference. "They are not to be expected to be as sensitive as we are. Their delicacy is not to be shocked or hurt very easily. They are wonderfully virtuous, I dare say. Some people contend for that, at least; and I am sure I don't want to contradict them. But they have not very fine natures, and they may be thankful that, like their coarse rough skins, they are not easily wounded."

"Really!" said Miss Dartle. "Well I don't know, now, when I have been better pleased than to hear that. It is so consoling. It's such a delight to know that, when they suffer, they don't feel! Sometimes I have been quite uneasy for that sort of people; but now I shall just dismiss the idea of them altogether. Live and learn. I have my doubts, I confess, but now altogether they're cleared up. I didn't know, and now I do know, and that shows the advantage of asking —don't it?"

I believe that Steerforth had said what he had in jest, or to draw Miss Dartle out; and I expected him to say as much when she was gone, and we two were sitting before the fire. But he merely asked me what I thought of her.

"She is very clever, is she not?" I asked.

"Clever! She brings everything to a grindstone," said Steerforth, "and sharpens it, as she has sharpened her own face and figure these years past. She has worn herself away by constant sharpening. She is all edge."

"What a remarkable scar that is upon her lip!" I said.

Steerforth's face fell, and he paused a moment.

"Why, the fact is, he returned, "I did that."

"By an unfortunate accident!"

"No. I was a young boy, and she exasperated me, and I threw a hammer at her. A promising young angel I must have been!"

I was deeply sorry to have touched on such a painful theme, but that was useless now.

"She has borne the mark ever since as you see," said Steerforth; and she'll bear it to her grave. She was the motherless child of a sort of cousin of my father's. He died one day. My mother, who was th?n a widow, brought here here to be company to her. She has a couple of thousand pounds of her own, and saves the interest of it every year to add to the principal. There's the history of Miss Rosa Dartle for you."

"And I have no doubt she loves you like a brother?" said I.

"Humph!" retorted Steerforth, looking at the fire. "Some brothers are not loved over much; and some love—but help yourself Copperfield! We'll drink the daisies of the field, in compliment to you; and the lilies of the valley that toil not, neither do they spin, in compliment to me—the more shame for me!" A moody smile that had overspread his features, cleared off as he said this merrily, and he was his own frank, winning self again.

I could not help glancing at the scar with a painful interest when we went in to tea. It was not long before I observed that it was the most susceptible part of her face, and that when she turned pale, the mark altered first, and became a dull, lead-colored streak, lengthening out to its full extent, like a mark in invisible ink brought to the fire. There was a little altercation between her and Steerforth about the cast of the dice at backgammon, when I thought her, for one moment, in a storm of rage; and then I saw it start forth like the old writing on the wall.

It was no matter of wonder to me to find Mrs. Sterforth devoted to her son. She seemed to be able to speak or think about nothing else. She showed me his picture as an infant, in a locket, with some of his baby-hair in it; she showed me his picture as he had been when I first knew him and she wore at her breast his picture as he was now. All the letters he had ever written to her, she kept in a cabinet near her own chair by the fire; and she would have read me some of them, and I should have been very glad to hear them, too, if he had not interposed, and coaxed her out of the design.

"It was at Mr. Creakle's, my son tells me that you first became acquainted," said Mrs. Steerforth, as she and I were talking at one table, while they played backgammon at another. "Indeed, I recollect his speaking, at that time, of a pupil, younger than himself who had taken his fancy there; but your name, as you may suppose, has not lived in my memory.

"He was very generous and noble to me in those days, I assure you ma'am," said I, "and I stood in need of such a frien. I should have been quite crushed without him."

"He is always generous and noble" said Mrs. Steerforth, proudly.

I subscribed to this with all my heart, God knows. She knew I did; for the stateliness of her manner already abated towards me, except when she spoke in praise of him, and then her air was always lofty.

"It was not a fit school generally for my son," she said; "far from it; but there were particular circumstances to be considered at the time, of more importance even than that selection. My son's high spirit made it desirable that he should be placed with some man who felt its superiority, and would be content to bow himself before it; and we found such a man there."

I knew that, knowing the fellow. And yet I did not despise him the more for it, but thought it a redeeming quality in him, if he could be allowed any grace for not resisting one so irrestible as Steerforth. ...

"My son's great capacity was tempted on, there, by a feeling of voluntary emulation and conscious pride," the fond lady went on to say. "He would have risen against all constraint; but he found himself the monarch of the place, and he haughtily determined to be worthy of his station. It was like himself."

I echoed, with all my heart and soul, that it was like himself.
